Abstract

Cochabamba's high valley, from his creation it has been the center of the agricultural production in the department, for such a motive it is born the idea of placing there are these municipalities again at the head of the development and the progress across a modernization in his infrastructure of irrigation, since since the shortage is known and lack of water availability in our department is oppressive and generates poverty and migration of the peasants who in search of sources of work emigrate to Will Plate.

there has been elaborated in the first instance an evaluation of the current situation of Cochabamba's high valley to know aspects related to the agricultural production, condition and functioning of the systems of irrigation that provide with water to this region standards of living of the peasants, etc.

there has been elaborated a budget and tentative chronogram of works, with three phases of implementation to short medium and long term, with which there parts a financial analysis that throws very positive values from a minimal benefit of 20 % which is very conservative (to see analysis of sensibility of the project).
