THE GREEK DEBT: AN ANALYSIS OF THE COMPOSING DATA FOR THE PERIOD 2004 – 2010

Georgia N. Kontogeorga, University of Patras

Georgios L. Thanasas, University of Patras

Athanasios Bellas, University of Patras

ABSTRACT

The financial crisis in Greece and other countries has resulted in an increasing concern over public debt and its viability throughout the world. The debt crisis in the Eurozone is still unfolding, as other European countries after Greece (such as Ireland) seek financial support from the rescue mechanism set by the EU/IMF and is gradually expanding in Portugal, Spain etc., thus increasing the concern for a potential domino effect in the Eurozone. The present study focuses on the diachronic change of the public debt of Greece during the 2004- 2010 period, while it also attempts an analysis of the accounts that compose it, in an effort to detect the factors that led to its expansion in the last years. Furthermore, the study analyses the accounts that compose the Greek debt and their potential correlation in a percentage scale and over time.

JEL: H63, H39, M48

KEYWORDS: Debt, Greece, GDP

INTRODUCTION

The economic crisis unfolding since mid 2008 led to a dramatic increase of the public debt in many developed economies. This impressive public debt increase is to some extent the result of government attempts to reduce the private debt that accumulated during the years before the recent financial unrest (Paul De Grauwe ,2010). Irving Fisher (1923) supported that there is a trade-off between private and public debt. When the government tries to reduce private debt, this results in an increase of public debt. The debt crisis has a significant impact on the Eurozone, as it constantly raises new issues as to its viability and the future of the Euro as a common currency (Adrian Blundell- Wingall and Patrick Slovic 2010, International Monetary Fund - IMF 2010).

Therefore the credibility of the Greek state is now an interesting issue for investigation, both because Greece is a member of the European Union, with active participation in the Economic and Monetary Union (EMU) and because it is linked to the economic policy exercised by each government, raising vital questions such as (i) the ability to exercise deficit budget policies and the impacts that these budgets have on macroeconomic variables (inflation, public investments, etc.), (ii) to what extent can these policies be realistic in the long term, (iii) the credibility problem that may arise, (iv) and finally the existing limitations on shaping fiscal policy. In various European Union countries, there is often great concern and scepticism (Torres and Giavazzi 1993, Kenen 1995), regarding the impact from the fiscal policy exercised by the central governments of countries, which dramatically the course towards the EMU. As regards the Public Debt, the interest of researchers mainly focuses on the manner in which Public Expenditures are financed and the actions for co-operation with other governments on fiscal policy issues. The importance of fiscal policy and harmonization is one of the main pillars of the EMU. Since its early stages, the imperative that the member-states of the Union be disciplined and present stability and uniformity was underlined. This was also validated by the Treaty of Maastricht (1992) and the establishment of a common monetary unit (ECU) and later, in 2002, of a common currency for the 17 countries, the Euro. To avoid fiscal instability in the EMU, the Treaty of Maastricht imposed a series of

strict rules, in an effort to conform, discipline and converge the fiscal policies of the member states, thus aiming to an increase of their credibility (The Maastricht Treaty, 1992).

The central idea for the convergence of European economies was set by the Delors report (1989). This report states that a monetary union without prior established fiscal convergence, may lead to monetary instability. Specifically, it mentioned that in the event of extreme accumulation of Public Debt by a member state of the Union, which will result in a credibility problem for said country, the remaining countries of the Union may face fiscal instability, even if they are disciplined as regards fiscal convergence with their policies. Such a development may cause monetary instability and even a monetary crisis in an environment of high monetary interdependence (Buiter, Corsetti and Roubini, 1993). The main condition for long-term balance in Public Economics is an equality between the rate of growth of the economy and the interest rate applicable for the repayment of the debt (Hamilton and Flavin 1986) (Buiter, Corsetti and Roubini, 1993). If a government borrows under an actual interest rate that is equal or greater than the rate of growth of its economy, this will lead to an increase of the debt to GDP ratio by the continuous deficits, thus decreasing the credibility of the public sector.

Georgakopoulos (1997) mentions that the main source of increase of deficits, and thus of the Public Debt, arises from the primary deficits and interests. Other significant factors are also the debts of state banks, the deficits of organisations and public enterprises, the forfeitures of guarantees etc., which contribute to the expansion of the public debt. At this point, we should refer to the sustainability of debt. Afonso (2000) believes that a sustainable fiscal policy exists when the limitation of the state budget is satisfied over time. This is achieved when the present value of debt, marginally, equals nil. When state contributions are not sufficient for the coverage of expenditure, a deficit is created, leading to non-sustainable fiscal policy.

Changes in fiscal policy are required as a result of non-sustainability. According to the International Monetary Fund (IMF, 2002), the sustainability of debt is a situation in which the borrower relies on its ability to continue servicing the debt, without causing great future corrections in its financial condition, that will disturb the balance of revenues and expenditure. The European Union (2006) deems that the concept of sustainability includes the prevention of excessive burden for future generations, and also guarantees the ability of the government to appropriately adjust the budget policy in the long- and short-term.

The European Union took yet another step in 2006, suggesting two indexes for measuring sustainability, by quantifying the budget adjustments required for:

- the achievement of the target, to bring the debt to around 60% of GDP by 2050 (S1 Indicator),
- the satisfaction of the temporal limitation of the budget in a finite time frame (S2 Indicator).

The sustainability indexes provide information as to the size of the necessary adjustments, as well as information on the cost resulting from the delay in implementing long term sustainability. According to the European Central Bank (2007), the sustainability of public economics is the prerequisite for stability, development and consistency within the Monetary Union. The European Central Bank (ECB) defines the concept of sustainability as the ability of a government to service its debt. Therefore, sustainability requires that the existing governmental policies satisfy the budget limitation over time. This implies that the present value of future primary surpluses equals the outstanding debt reserve. Therefore, the higher the level of the outstanding debt, the bigger the future primary surplus must be to ensure sustainability. (Koutsokostas C.,2010) Finally, the International Monetary Fund (IMF) introduces an alternative term for sustainability, which deems that: "Debt is sustainable if the credibility condition is met. The credibility

condition is achieved when the future surplus is sufficient for the repayment of the debt". Based on that, the future balancing of the debt is the most important factor for a sustainable stable fiscal policy.

Every government receives its revenue from the majority of the citizens of the state, namely taxpayers. Public debt, on the other hand, as government debt is also indirectly the debt of taxpayers. Finally, the holders of the debt as an asset (namely those to whom the debt is due) are private individuals, banks and any institutional or private investor that has bought and holds state bonds.

The public debt is divided into "internal debt", namely creditors who are within the country, and "external debt", namely creditors who are based outside the country, abroad. This division is of particular significance since external debt is quoted in another currency, as opposed to internal debt that is quoted in the national or domestic currency (for EU state members the common currency of the Euro is deemed as domestic). In order to cover public expenditures, governments are financed primarily by tax revenues, yet a rather significant part of those is usually covered by public borrowing, in the form of issuing and selling bonds or other securities. Any resort to government borrowing to cover public expenditure necessarily results in either the creation or the increase of the existing public debt. This in essence also displays the state of the total obligations of the Government (the State), at a given time, vis-a-vis every type of lender.

Over the last years, Public Debt tends to be linked to a country's product, which is called Gross Domestic Product (GDP). For this reason, apart from the absolute value of the debt, a significant index of the economic and financial viability of the state (as also provided by the the updated text of the Stability and Growth Pact in the European Union) is the relation between public debt and gross domestic product, since the ratio of these two is a significant index or parameter.

Empirical Analysis

This article analyses the make up of the Public Debt of Greece for period 2004 - 2012, as shown in the official data of the Ministry of Finance. Specifically, the make up of Greece's Public Debt is determined by the following accounts:

- Loans and Bonds from foreign countries in euro and in foreign currency,
- Loans and Debts in drachmas (converted in euro)
- Loans expressed in foreign currency,
- Loans and Debts in gold,
- Greek Government Treasury Bills
- Loans under Laws 828 and 959/1943 in intact securities,
- Greek State Bonds
- Loans of the Bank of Greece in drachmas in foreign currency-linked bonds,
- Loans of the Bank of Greece in drachmas in foreign currency-linked bonds,
- Equity Loans in foreign currency (at the time of issuance),
- Fiscal Consolidation Loans.

Analysis of Actual Economic Data

Table 1 details the accounts that make up the Public Debt of Greece, for the 2004-2010 period.

Table 1: The accounts that make up the Greek Debt

	2004	2005	2006	2007	2008	2009	2010

Total	191,294,914,5 95.91	208,297,767, 970.93	219,591,762,1 43.05	235,289,003,0 22.25	258,163,016,1 96.79	296,030,545,3 29.70	334,481,646,1 58.20

The analysis of the data shown in the above table shows that the total debt of Greece is stably increasing over time and has almost doubled within seven years. Specifically: The Public Debt for the fiscal year 2004 was 191,294,914,595.91€ corresponding to 98.6% of GDP, in 2007 it was 235,289,003,022.25€ or 103.12% of GDP, finally reaching, by the end of the fiscal year 2010, the sum of 340,286,201,897.54€ or 147.70% of GDP. Throughout this period, we see that the accounts that mainly affect the total debt of Greece, namely the Greek State Bonds primarily and the Loans and Bonds from foreign countries in Euro and in foreign currency, are constantly increasing. Specifically, as to the Greek State Bonds, they were 155,930,094,034.75 € in 2004, while Loans and Bonds from foreign countries in Euro and in foreign currency were 21,739,716,704.55€ and in 2010 respectively they were 256,452,630,795.99€ and 62,433,458,878.10€ When comparing the Public Debt of Greece to the respective debt of other Eurozone states with fiscal adjustment problems, but also to the average of the 17 of Eurozone and the EU27 we notice the following: In the case of Ireland, the respective percentage for the 2004-2007 period was steadily decreasing and very low (approximately 25%), while it doubled in 2007, reaching 44.2%, and 92.5% in 2010. A similar course to that of Greece was followed by the public debt in Portugal which over the period of study increased from 57.6% in 2004 to 93.3% in 2010. The case of Italy is interesting (this

is the country with the second largest debt rate in the Eurozone); in 2004-2008 it showed stabilizing tendencies (approximately 105%) while in 2009-2010, the percentage of public debt increased, reaching 118.4%. Compared to the EU17 average for 2004-2008, it appeared to stabilize, reaching 69-70%. For the years 2009 and 2010 it marked a proportionate increase, since three of the Eurozone member states (Greece, Portugal and Ireland) needed financial support. Thus the percentage increased to 79.8% for 2009 and to 85.3% for 2010. Finally, as to the enlarged EU27, for the 2004-2008 period the percentage was stable, around 61%, while for 2009 and 2010 the percentages dramatically increased reaching 74.7% and 80.1% respectively, although in smaller percentages than those of the EU17. Diagram 1 presents the public debt of Greece for 2004-2010, while diagram 2 presents the public debt as a percentage of GDP over time.

Diagram 1: The Greek public debt for the 2004-2010 period

Diagram 2: The Greek public debt as percentage of GDP for the 2004-2010 period.

Percentile structure of Public Debt accounts

At this point it is important to present the structure of the the Greek debt in a way that shows the contribution of each account to the aggregate debt, both in percentages and over time. Table 2 presents the accounts that make up the Public Debt as well as the percentage of their participation in the aggregate debt of Greece.

As already mentioned, the accounts that mainly affect the aggregate debt of Greece are two: The Greek State Bonds and the Loans and Bonds from foreign countries in Euro and in foreign currency. In the last seven years Greek State Bonds have been the main part of the Greek Debt, with a percentage exceeding 80% for almost the entire period of study. Moreover, this account increases from 2004 to 2009, with a great decrease of almost 9% in 2010. The other account affecting the composition of the Greek debt is Loans and Bonds from Foreign Countries, which is mainly 11% of the aggregate debt. This account appears to have overall stabilizing tendencies in the 2004-2009 period. However, in 2010 it marks a

sharp increase of 9%. We also notice that these two primary accounts of composition of the Greek debt are inversely proportional and an increase of one means a decrease of the percentage of the other. Other accounts that make up the debt, are small percentages, which are either fixed, or decreasing, depending on the character of each account. Specifically, it is found that the increase of the Public Debt up to 2007 (2007 included), was almost the exclusive result of the increase of the Greek State Bonds, while the increase of the Public Debt in 2008 was mainly the result of the increase of the remaining loans of categories: "Greek State Bonds" and "Loans and Debts in foreign currency (at issuance)".

Table 2: Percentages (%) of Greek Debt Composition

	2004	2005	2006	2007	2008	2009	2010
Loans and Bonds from foreign countries in euro and in foreign currency (FN)	11.36	11.16	11.25	10.46	12.47	9.19	18.67
Loans and Debts in drachmas	1.42	1.24	1.11	1.00	0.88	0.74	0.31
Loans in foreign currency	0.24	0.05	0.05	0.04	0.03	0.03	0.00
Loans and Debts in gold	0.02	0.02	0.02	0.01	0.01	0.01	0.00
Government Treasury Bills	0.96	0.70	0.51	0.41	0.42	3.06	2.82
Loans of L. 828, 959/1943	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Greek State Bonds	81.51	82.89	83.56	84.97	83.91	85.11	76.67
Loans of the Bank of Greece in drachmas	2.66	2.31	2.07	1.82	1.55	1.26	1.04
Loans of the Bank of Greece in FC	1.19	1.07	0.95	0.84	0.72	0.58	0.48
Equity loans in foreign currency	0.01	0.01	0.01	0.01	0.01	0.01	0.00
Fiscal Consolidation Loans.	0.62	0.55	0.48	0.45	0.00	0.00	0.00
Total	100.00	100.00	100.00	100.00	100.00	100.00	100.00

In 2009 the increase of the Public Debt was mainly the result of the increase of the remaining loans of categories: "Greek State Bonds" and "Greek Government Treasury Bills", while the increase of 2010 is due to the coverage of the deficit of the Central Government, the inclusion of off-market swaps in the public debt, the undertaking of the obligations of the Greek Payment Authority of Common Agricultural Policy (OPEKEPE) and Greek Agricultural Insurance Organization (ELGA), the payment of a sum to the Financial Stability Fund, the payment of the forfeited guarantees of the State, the payment of debts of previous administrations to hospital suppliers as well as to the Social Securities Fund (IKA), ATE SA and Egnatia SA, the payment of security organisations and local authorities, the implementation of equipping programs, the payments from the tertiary account 234331/7 of the Greek State to the Bank of Greece, which is an off budget account but within the framework of public transaction and finally, the issuance of special Greek Government securities available by borrowing from bank companies aiming at liquidity, under the provisions of L. 3723/2008.

Correlations between the Data Composing the Public Debt

At this point, and based on the above analysis, it is useful to detect the correlation between the accounts that compose the debt of Greece. For this analysis we used descriptive statistics.

Table 3: Correlations between the Accounts of the Greek Debt.

	Loans and Bonds from foreign countries in euro and in foreign currency (FN)	Loans and Debts in drachmas	Loans in foreign currency	Loans and Debts in gold	Government Treasury Bills	Loans of L. 828, 959/1943	Greek State Bonds	Loans of the Bank of Greece in drachmas	Loans of the Bank of Greece in FC	Equity loans in foreign currency	Fiscal Consolidation Loans.
Loans and Bonds from foreign countries in euro and in foreign currency (FN)	1	-0.979*	-0.516	-0.928*	0.673	a	0.702	-0.741	-0.754	-0.725	-0.639
Loans and Debts in drachmas	-0.979*	1	0.611	0.882*	-0.751	a	-0.802*	0.831*	0.839*	0.818*	0.677
Loans in foreign currency	-0.516	0.611	1	0.218	-0.375	a	-0.714	0.763*	0.709	0.743	0.567
Loans and Debts in gold	-0.928*	0.882*	0.218	1	-0.567	a	-0.470	0.509	0.540	0.499	0.380
Government Treasury Bills	0.673	-0.751	-0.375	-0.567	1	a	0.832*	-0.752	-0.774*	-0.743	-0.703
Loans of L. 828, 959/1943	a	a	a	a	a	a	a	a	a	a	a
Greek State Bonds	0.702	-0.802*	-0.714	-0.470	0.832*	a	1	-0.987*	-0.987*	-0.985*	-0.906*
Loans of the Bank of Greece in drachmas	-0.741	0.831*	0.763*	0.509	-0.752	a	-0.987*	1	0.997*	0.999*	0.898*
Loans of the Bank of Greece in FC	-0.754	0.839*	0.709	0.540	-0.774*	a	-0.987*	0.997*	1	0.998*	0.908*
Equity loans in foreign currency	-0.725	0.818*	0.743	0.499	-0.743	a	-0.985*	0.999*	0.998*	1	0.899*
Fiscal Consolidation Loans.	-0.639	0.677	0.567	0.380	-0.703	a	-0.906	0.898*	0.908*	0.899*	1

Based on the above Correlations table, we see which accounts correlate to others and to what extent. For the amounts marked with * the correlation is significant at a level of 0.05 (2-tailed). Furthermore for sums with negative sign (-), correlation with that account is inverse.

Thus, the account Loans and Bonds from foreign countries in euro and FC has almost absolute negative correlation to the account Loans and Debts in drachmas and the account Loans in gold. This means that as Loans and Bonds from foreign countries in euro and FC increase, the two other accounts are reduced by almost the same sum. The account Loans and Debts in drachmas are adversely affected by Loans and Bonds from foreign countries in euro and FC and Greek State Bonds, while they have a positive correlation to Loans and Debts in Gold, Loans of the Bank of Greece in drachmas, Loans of the Bank of Greece in FC and Equity Loans in Foreign Currency.

Loans in Foreign Currency appear to be affected and have positive correlation to the Loans of the Bank of Greece in drachmas. Loans and Debts in Gold, have a strong negative correlation to Loans and Bonds

from foreign countries in euro and FC and a positive correlation, but not equally strong, as Loans and Debts in drachmas. Greek Government Treasury Bills are positively correlated to the Greek State Bonds and negatively to the Bonds of the Bank of Greece in Foreign Currency. On the other hand, Greek State Bonds have only one positive correlation to Greek Government Treasury Bills and strongly negative correlation to Loans and Debts in drachmas, Loans of the Bank of Greece in drachmas, Bonds of the Bank of Greece in foreign currency, Equity Loans in Foreign Currency, Fiscal Consolidation Loans. Loans of the Bank of Greece in drachmas have positive correlations to Bonds of the Bank of Greece in Foreign Currency, Equity Loans in Foreign Currency and Fiscal Consolidation Loans, while they have negative correlation to Loans and Debts in drachmas and Greek State Bonds.

Bonds of the Bank of Greece in Foreign Currency, are positively correlated to Loans and Debts in drachmas, Loans of the Bank of Greece in drachmas, Equity Loans in foreign currency and Fiscal Consolidation Loans and negative correlated to Government Treasury Bills. Equity Loans in foreign currency are positively correlated to Loans of the Bank of Greece in drachmas, Bonds of the Bank of Greece in Foreign Currency and Fiscal Consolidation Loans, they are negatively correlated to Loans and Debts in drachmas and Greek State Bonds. Finally Fiscal Consolidation Loans positively correlate with Loans of the Bank of Greece in drachmas, Bonds of the Bank of Greece in Foreign Currency and Equity Loans in Foreign Currency.

CONCLUSIONS

This paper presents the Public Debt of Greece over time for the 2004-2010 period. In this period of economic crisis, the monitoring of the Debt in Greece is more imperative than ever. This is easy to understand, since Greece is a member of the common European currency and therefore its decisions and actions have an impact on the entire Eurozone. For the present analysis we used official data from the eleven (11) accounts that compose the public debt of Greece. The percentages of changes of these accounts were presented over time as well as their correlations to other accounts. As to the ratio of the Gross Domestic Product to the Public Debt, which is a significant index or parameter for economic growth on the critical period, we notice that the rate of growth of the GDP is smaller to the interest rate of state bonds, and this results in the creation of a primary deficit as to the GDP. Namely we notice that from 2007 and up to 2010, the percentage of increase of the Public Debt in Greece almost doubled every year, while the amount of debt as a percentage on GDP also increased, which during these last four years from 103% reached 147.70% of GDP. The analysis of the Public Debt shows that over the last seven years Greek State Bonds have been the main part of the Greek Debt, with a percentage exceeding 80% throughout the study period, with the exception of the 2010 increase which is due to - apart from the bonds and the coverage of the deficit of the Central Government - the payment of a sum to the Financial Stability Fund, the payment of debts of previous administrations to various suppliers of the State, the implementation of equipping programs and payments that are available by borrowing from bank companies aiming at liquidity. As to the measures required, the European union has already suggested a set of measures such as: the restructuring or elimination of public enterprises and agencies of the State, privatisations, cuts in their operating costs, redefining of the priorities in the investments' sector, cost control, expenditure constraint with improvement of the administration of the system as to healthcare etc.

(European Commission 2011). However, throughout the Eurozone too, during the economic booming of 2005-2007, we do notice an average annual increase of the private debt of member states by approximately 35% of GDP. Unlike the years of economic depression in 2008 -2009, the private debt decelerates and the rate of public debt growth accelerates. This is exactly what happens since the culmination of the crisis in October 2008, with governments being forced to guarantee for problematic banks, undertaking a significant portion of the debt of the weakest financial institutions (Kouretas, Vlamis, 2010). Greece, could not be the exception to this rule. In conclusion, we find that the current economic crisis in Greece was caused by a combination of national and international factors.

Domestically, high state expenditures, structural rigidity, tax evasion, corruption etc., have contributed to the accumulation of debt in Greece over the last decade. Internationally, the adoption of euro and the loose application of the EU rules aiming to the limitation of debt accumulation is also deemed as having contributed in the current crisis in Greece. However, the manner in which the imbalances that are increasingly detected within the Eurozone shall be resolved, may be a significant component of debates for the European integration in the future. (Nelson, et al, 2010)

He is teaching Financial and Cost Accounting. His research interests are focused except for Accounting, principles of Finance as leasing, factoring and business failure. E-mail: bellas@upatras.gr

AN EMPIRICAL STUDY OF THE RELATIONSHIP BETWEEN CORPORATE SOCIAL RESPONSIBILITY DISCLOSURE AND ORGANIZATIONAL PERFORMANCE: EVIDENCE FROM LIBYA

Nagib Salem Bayoud, The University of Southern Queensland
Marie Kavanagh, The University of Southern Queensland
Geoff Slaughter, The University of Southern Queensland

ABSTRACT

This paper examines the relationship between corporate social responsibility disclosure (CSRD) and organisational performance in terms of financial performance, employee commitment and corporate reputation in Libyan companies through stakeholder's pressures. The researchers have chosen the Libyan context as one of the world's developing countries and it has undergone many changes over a short period of time in terms of economic, environmental and social changes. The empirical study was used to collect data relating to CSRD and organisational performance in Libyan companies, it was employed to analyse 110 annual reports of 40 firms that were gathered by using content analysis. This paper reveals that level of CSRD in the annual reports has a positive relationship with organisational performance in terms of financial performance and corporate reputation, while there is not significant relationship between level of CSRD and employee commitment. This paper contributes to the accounting literature by providing evidence from Libya that perceived the level of CSRD in annual reports can have an influence on level of both financial performance and corporate performance by stakeholder's pressure.

INTRODUCTION

Major corporate ethical disasters impacting on the environment, human resources, and the community have heightened the demand for public firms to voluntarily disclose their corporate social responsibility (CSR) activities to stakeholders. A means of comprehension and tracking CSR impacts, through creating good dialogue with stakeholders of a company, effective CSRD is intended to improve stakeholder-related performance. In effect, CSRD allows companies to make internal decision; enabling companies to identify strengths and weaknesses points across the whole CSR reporting that in turn measure the value of long-term relationships and assets. In addition, using effective measuring through CSR reports enables companies to manage external relationships, attracting stakeholders who prefer to deal with socially responsible business and have the power to reward it (Waddock & Bodwell 2004). Indeed, CSRD definitely supports stakeholder dialogue by communicating what firms achieve in the area of stakeholder-related CSR. The business media often show instances where some firms resort to socially irresponsible practices in order to improve their performance at the expense of CSR activities. Although there is a will of political actors in some developing countries experiencing fast economic growth such as Malaysia and the UAE to disclose corporate social responsibility activities in terms of health and safety, investors protection, and pollution, the levels of disclosure in some developing countries remain low compared with some developed countries (Al-Khater & Naser 2003; Rettab et al. 2009). Libya falls within this category, as it is also developing and growing economically. However, the level of CSRD has increased since 2000

in Libya compared to previous years (Pratten & Mashat 2009) due to pressures from stakeholders, which in turn may influence organisational performance of companies in Libya.

The purpose of this paper is to examine the relationship between CSRD and organisational performance in terms of financial performance, employee commitment and corporate reputation. To empirically address the research question above, the researchers suggested the three hypotheses and reviewed the three-year CSR reporting experience of a sample of Libyan companies, relating the level of CSRD disclosure to performance. The researchers used a stakeholder theory to formalize and test a set of hypotheses, and we revealed that the mere level of CSRD have an influence on organisational performance in terms of financial performance and corporate reputation in Libya. The next section shows some details about the literature review and research framework about this topic, section 3 describes the research methods used which includes empirical study through quantitative methods and section 4 presents the findings and discussion. The final section contains a summary and conclusion.

LITERATURE REVIEW AND RESEARCH FRAMEWORK

Researchers' efforts have been made to understand the impact of CSR activities and disclosure on organisational performance which indicated positive, negative, mixed, or non-significant results (Branco & Rodrigues 2006; Husted & de Jesus Salazar 2006; Marom 2006; Orlitzky et al. 2003; Toms 2002).

CSRD and Financial Performance

Financial performance considers one of the most important studied indicators of the strategic value of CSR (Orlitzky et al. 2003). Researchers have started the empirical study of CSR and financial performance (FP) over three decades ago in western countries. Many firms have faced the pressure for corporate accountability which it is increasing from their stakeholders (managers, employees, customer, government, shareholders, and so on) (Waddock 2004). This pressure includes some aspects such as legal, social, moral, and financial aspects. Some studies argue that CSR activities might be consistent with wealth maximization motives of the firm and provide appropriate information for corporate decision making (Pava & Krausz 1996). There are two types of empirical studies of the relationship between CSR and financial performance. The first set uses the event study methodology to measure the short-run financial impact when companies appoint in socially responsible or irresponsible acts (e.g. Margolis & Walsh 2003; McWilliams & Siegel 2000; Orlitzky et al. 2003).

Market-based measure of financial performance was employed to achieve these studies such as the firms share price, share price appreciation. Market-Based measure reflects the concept that shareholders are the most important stakeholder group whose satisfaction determines the firms' fate. Mixed results have been produced by studies on the effects of CSR activities on firm value. Some studies have concluded beneficial effects while others found that the effects are negative or no relationship. For example, Margolis and Walsh's found that 4% of the 160 studies examined considered a negative relationship between CSR and financial performance, 55% a positive relationship, 22% was no relationship, and 18% reported a mixed relationship. Furthermore, Orlitzky et al. (2003) achieved another meta- meta-analysis and revealed similar results. While other studies are not similarly stable concerning the relationship between CSR and short-run financial return (McWilliams & Siegel 2000). The examination of the nature of the relationship between measures the long-term financial performance and a measures of CSR is the second set that is used from accounting and financial measures of profitability (e.g. Aguilera et al. 2007; McWilliams & Siegel 2000; Simpson & Kohers 2002; Waddock & Graves 1997).

Accounting returns such as return on equity, or return on investment, return on assets are used to identify managers' discretionary allocations of funds to different projects and policy choices. As consequently, these measures reflect internal decision-making capabilities and managerial performance instead of external market responses to organizational (non-market) actions (Orlitzky et al. 2003). They also gained the same results in these studies that were mixed. Some studies (Aguilera et al. 2007; Simpson & Kohers 2002; Waddock & Graves 1997) found a significant positive relationship between CSR, disclosure and financial performance; McGuire, Sundgren and Schneeweis (1988) revealed that subsequent performance was less closely related to CSR than prior performance. In addition, McWilliams and Siegel (2000) reached that there was no link between a CSR and financial performance if the regression model is properly specified. Finally, Rettab, Brik & Mellahi (2009) in the UAE market as an emerging economy did the latest study of corporate social and financial performance. They found a strong positive relationship between CSR and financial performance. Therefore, this study attempts to contribute in this area and may facilitate more intensive research on CSR and financial performance links outside of western countries and US markets in the future, especially in Libya as developing country and emerging country. Therefore, the researchers present the following hypothesis:

H1: Higher levels of CSR provided by firms are positively associated with its higher financial performance in Libya.

CSR And Employee Commitment

Employees consider one of the most important factors in a firm; they affect an organisation. Therefore, "the effective delivery of corporate social and environmental responsibility initiatives is dependent on employee responsiveness" (Collier et al. 2007, p. 22). Carroll (1979) notices that CSR and community contributions and reflects the way in which the firm interacts with the physical environment and its ethical stance towards consumers and other external stakeholders. External CSR on internal and external information sources including the media and their personal experience within the company may be expected to base their employee opinions about these activities.

Employees and managers have a greater stake in the success of the corporation than investor, owners, because their jobs and economic livelihood are at stake. Branco and Rodrigues (2006) discussed that CSR leads to important results on the creation or deletion of other fundamental intangible resources, and may help build a positive image with employees and managers. Some studies expected that there is a positive relationship between CSR and disclosure with employee commitment (Backhaus et al. 2002; Brammer et al. 2007; Maignan & Ferrell 2004). At the same time, relationship between procedural justice and affective commitment may be expected a positive because employees may be expected to identify with ethical organizations (Brammer & Millington 2005). The existing literature provides compelling empirical support for these arguments; a strong relationship has been found between the ethical climate of organizations and job satisfaction (Koh & Boo 2001) and studies of the relationship between organizational commitment and procedural justice suggest that they are positively and significantly related (Albinger & Freeman 2000; Backhaus et al. 2002; Peterson 2004) illustrated that a firms social responsibility deals with matter to its employee and expect to have a positive impact on employees commitment. In addition, Maignan et al (1999) expected that firms that disclose in CSR activities and disclosure might enjoy enhanced levels of employee commitment for two reasons: they have devoted to ensuring the quality of workplace experience, and they inform their stakeholders about social issues such as the welfare of the community or the protection of the environment.

Rupp et al (2006) noticed that employees' perceptions of their firms CSR activities lead their perceptions of the firm. Thus, it can be seen that firms that engage in CSR activities will appear a positive relationship with their employee commitment because they might earn employees commitment compared with firms that do not engage in CSR activities (Aguilera et al. 2007). Exploring a positive relationship between

CSR and disclosure with financial performance is more likely to lead a positive relationship between CSR and disclosure with employee commitment. Rettab et al. (2009) explored that there is a positive relationship between CSR and employee commitment in the UAE market. On the other hand, Turker (2009) found that there is no link between CSR to government and the commitment level of employee by using social identity theory. Based on the above, the researchers advance the following hypothesis:

H2: Higher levels of CSR provided by firms are positively associated with its higher employee commitment in Libya.

CSR and Corporate Reputation

There is many research which provides evidence to define corporate reputation, as according to Siltaoja (2006, p. 91): “the most important competitive advantage that companies can have [by]... assessments about what the organisation is, how well it meets its commitments and conforms to stakeholders’ expectations, how effectively its overall performance fits with its socio-political environments”. Emerging CSR lead to enhancing corporate reputation whereas non-emerging CSR lead to destroyed corporate reputation for a firm. Some companies may employ CSR as one of the informational signals upon that stakeholder’s base their assessments of corporate reputation under conditions of incomplete information (Branco & Rodrigues 2006). Also, Branco and Rodrigues (2006) explain that enhancing the effects of CSR in corporate reputation has particularly importance by CSR. In addition, Hooghiemstra (2000) argues that one of the most important communication instruments that is used by firms to enhance , create, and protect their images or reputations is CSR. Moreover, it is not easy to create positive reputation without making associated disclosure for firms investing in CSR activities to realise the value of such reputation (Hasseldine et al. 2005; Toms 2002). Furthermore, Toms (2002) explain that disclosure in annual reports, disclosure of environmental policies, and the implementation were found to contribute explicitly in create a positive corporate reputation. Besides to that, Toms (2002) and Hasseldine et al. (2005) results that qualitative nature of environmental disclosure is rather than quantity nature of environmental disclosure, as opposed to mere volume and has a strong effect on the creation, enhancement , and protection of corporate reputation. Thus, the relationship between CSR and corporate reputation should be clear and positive.

Number of studies revealed that CSR and CSR have a positive or negative effect on corporate reputation. Peterson (2004) noted that recent corporate experience in the oil and pharmaceuticals industries have emphasized negative consequences for corporate reputation that is more likely to flow from inappropriate behaviour towards the environment or consumers. At the same time, Brammer and Millington (2005) have found positive relationships between corporate reputation and CSR activities and Also, Clarke and Gibson-Sweet (1999) note that the importance of the use of corporate disclosure considers an effective factor on the management of reputation and legitimacy. Finally, Rettab et al. (2009) found that there is appositive relationship between CSR and corporate reputation in the UAE market. Therefore, the researchers advance the following hypothesis:

H₃: Higher levels of CSR provided by firms are positively associated with its higher corporate reputation in Libya.

RESEACH METHODS

Sample And Data Collection

The quantitative method was employed the annual reports of the period of 2007 and 2009 and the questionnaire survey. The population for the current paper included 135 Libyan organisations in different sectors. A final sample of 40 firms was collected (See Table 1). The annual reports of this

study were collected through using the company web pages and/ or by visiting company office to measure level of CSRD and financial performance.

Table 1: Response Rate from (content analysis) and Questionnaire survey (Managers and Employees)

Sector	Manufacturing	Mining	Banking and Insurance	Services	Total
Population (a)	32	8	20	75	135
Final sample (b)	12	1	13	14	40
Sample Rate (b/a) %	37.5%	12.5%	65%	19%	30%
Number of participants	128	32	80	300	540
From managers	32	8	20	75	135
From employees	96	24	60	225	405
Responses received (c)					
From managers	12	1	13	12	38
From employees	35	3	38	34	111
Response Rate (c/a) %					
From managers	37.5%	12.5%	65%	16%	28%
From employees	36.4%	12.5%	63.3%	15.1%	27.4%

Table 1 shows the sample and data collection from the annual reports of 2007 to 2009 about the level of CSR information and the relationship between CSR information and financial performance in Libya. This table also shows the responses rate from managers and employees about the relationship between CSR information and organisational performance in terms of employee commitment and corporate reputation in Libya.

Data on employee commitment and corporate reputation were collected by survey questionnaires. The final number of questionnaires was 149 questionnaires from a total population of 135 organisations of different sectors. As result of most studies have used managers and employees to collect data about employee commitment (Brammer & Millington 2005; Fombrun et al. 2000; Hasseldine et al. 2005; Rettab et al. 2009; Toms 2002)), questionnaires were sent to one manager and three employees of each company by personal meeting (See Table 1). Both employee commitment and corporate reputation were measured by using seven items (employee commitment) and six-main items (corporate reputation) on a 5-point Likert scale, with 1= strongly disagree to 5= strongly agree. The employee commitment items were developed by Yousef (2003), and provide a firm-level evaluation of employee commitment to a firm, while corporate reputation items were adapted from a scale derived from Fombrun et al. (2000) to measure corporate reputation.

Empirical Model

The purpose of multivariate regression was used to measure, explain and predict the degree of linkage among variables (Hair et al. 2006). Therefore, this paper used the following regression models through SPSS program to examine the relationship between CSRD and organisational performance in terms of financial performance, employee commitment and corporate reputation as being proposed by the following hypotheses.

$$\begin{aligned}
 FP &= \alpha + \beta_1 \text{ CSRD} + \beta_2 \text{ SIZE} + \beta_3 \text{ AGE} + \beta_4 \text{ INDTY} + \varepsilon \dots\dots\dots (H_1). \\
 EC &= \alpha + \beta_1 \text{ CSRD} + \beta_2 \text{ SIZE} + \beta_3 \text{ AGE} + \beta_4 \text{ INDTY} + \varepsilon \dots\dots\dots (H_2). \\
 CR &= \alpha + \beta_1 \text{ CSRD} + \beta_2 \text{ SIZE} + \beta_3 \text{ AGE} + \beta_4 \text{ INDTY} + \varepsilon \dots\dots\dots (H_3).
 \end{aligned}$$

Where FP refers to financial performance measures (return on equity, return on assets and revenues); EC refers to employee commitment and CR refers to corporate reputation as dependent variables, CSRD represents the independent variables (Employee (EMP), Community involvement (COM), Consumers (CON), Environment (ENV)), and all of the control variables including the Age of the firm (AGE) that was measured by total of assets (Branco & Rodrigues 2008), the Industry type (INDTY) that was measured by a dummy variable that takes the value of “1” if a firm is in a manufacturing and mining sector, and the value of “0” if otherwise (Elsayed & Hoque 2010), and the Size of the firm (SIZE) that

was measured by the number of years since establishment in Libya (Rettab et al. 2009); B is the coefficient of the independent variables.

RESULTS AND DISCUSSION

Descriptive Analysis

The data showed in Table 2 point out that respondents the perceived influence of CSRD on corporate reputation (3.782) can be ranked as (1), followed by the perceived influence of CSRD on employee commitment (3.484), whereas the data obtained from the annual reports can be ranked as (1) for return on equity, then (2) for return on asset. This table also presents descriptive statistics for all the variables of interest. The average indexes illustrate higher disclosure on consumer disclosure (mean = 0.382), employee disclosure (mean = 0.358), and community disclosure (mean = 0.255) and less disclosure on environmental information (mean = 0.216).

Table 2: Descriptive statistics for all variables

Variables	Minimum	Maximum	Median	Mean	Std. D	Skewness	Kurtosis
Return On Asset	0.0007	0.3702	0.0207	0.05917	0.0854	2.260	5.085

Type Of Industry	0	1	0	0.3300	0.4740	0.777	-1.473-

This table shows the statistics for all the variables of interest and the perceived influence of CSRD in terms of environmental disclosure, consumer disclosure, community disclosure and employee disclosure on organisational performance in terms of financial performance, employee commitment and corporate reputation.

Correlation Analysis

Across the whole dataset shown in Table 3 present a preliminary indication that some independent are associated with organisational performance indexes. The correlations are a significant and positive between some independent variables and the organisational performance indexes. The perceived influence of consumer disclosure and the perceived influence of employee disclosure have higher correlations with corporate reputation index (0.772, p-value < 0.05 and 0.690, p-value < 0.05 respectively), return on equity (0.661, p-value < 0.05 and 0.506, p-value < 0.05 respectively) and employee commitment (0.539, p-value < 0.05 and 0.499, p-value < 0.05 respectively) than the majority of independent variables.

In similar vein, four independent variables (consumer disclosure, community disclosure and employee disclosure) are significantly and positively correlated with both corporate reputation and return on equity indexes. As can be seen from Table 8, most dependent variables have more than one correlation with independent variables. However, only community disclosure has significantly and positively correlated with return on asset index (0.563, p-value < 0.05). Also, there is no correlation between all dependent variables indexes and environmental disclosure except revenues index (0.321, p-value < 0.05). The results pertaining to correlations between dependent variables and independent variables in both Pearson correlation and Spearman's Rho correlation tables are relatively similar.

Table 3: Pearson (above) and Spearman's Rho (below) correlation coefficients between levels of CSR disclosure and organisational performance

Variables	Financial Performance			Employee Commitment	Corporate Reputation	Size	Age	Type of Industry
	Return on Asset Correlation	Return on Equity Correlation	Revenues Correlation	Correlation	Correlation	Correlation	Correlation	Correlation

	0.004	-0.198-	-0.262-	-0.115-	-0.085-	-0.310-	-0.056-	1
	0.176	-0.227-	-0.274-	-0.125-	-0.090	-0.279-	0.042	1

** Correlation is significant at the 0.01 level (2-tailed). * Correlation is significant at the 0.05 level (2-tailed). This table shows the Pearson and Spearman's Rho Correlation coefficients for the association between levels of CSRD in under four categories and organisational performance are reported.

Multivariate Regression Analysis

Standards tests on skewness and kurtosis test (table 2), as well as Kolmogorov-Smirnov normality test and Shapiro-Wilk normality test (table 4) indicate that most dependent variables are not found normally distributed except for employee commitment and corporate reputation. In this vein, all independent variables and control variables are not to be normally distributed. Therefore, van der Waerden's transformation is employed to transform the dependent and continuous independent variables (independent variables and control variables) to normal scores for the conducting the regression analysis (Haniffa & Cooke 2005). It can be seen that the transformation of the dependent variables is entirely successful, while the continuous independent variables is not entirely successful except for size and age.

Table 4: Tests of Normality

Variables	Untransformed data				Transformed data			
	Kolmogorov-Smirnov ^a		Shapiro-Wilk		Kolmogorov-Smirnov ^a		Shapiro-Wilk	
	Statistic	p-v	Statistic	p-v	Statistic	p-v	Statistic	p-v

Employee Disclosure	0.226	0.000	0.892	0.002	0.203	0.000	0.896	0.002
Size	0.293	.000	.591	.000	.023	.200*	.995	1.000
Age	.144	.045	.942	.048	.050	.200*	.989	.967
Type Of Industry	.433	.000	.586	.000	.433	.000	.586	.000

This is a lower bound of the true significance. This table shows the Kolmogorov-Smirnov (K-S Lilliefors) and the Shapiro-Wilk normality tests statistics for the untransformed and the transformed data (van der Waerden's transformation) regarding to the dependent variables and the continuous independent variables.

In addition to tests of normality, the table 5 of correlation matrix for the dependent and continuous independent variables (transformed data) and the table 6 of collinearity statistics and are used to check

for multicollinearity, homoscedasticity and linearity. The correlation matrix shows that the correlations between the continuous independent variables are low, that means; there is no serious multicollinearity. If the coefficients of correlation between continuous independent variables exceed 0.800, that indicates only indicative of serious Collinearity (Gujarati 1995). In addition, the Collinearity statistics illustrate that there is no problem with multicollinearity, because of the highest variance inflation factor (VIF) in the regressions are less than 3. Kennedy (1992) considers that based on the VIF, multicollinearity is a serious problem if continuous independent variables exceeds 10. In this regard, a residuals analysis is applied on the results, the problem of linearity and heteroscedasticity does not exist in the data. (Noruésis 1995, p. 447) defined Residuals as ‘what are left over after the model is fit and they are also the difference between the observed value of the dependent variable and the value predicted by the regression line’.

Table 5: Correlation matrix for independent, and the continuous independent variables (Pearson above diagonal, Spearman below) and Collinearity Statistics.

** Correlation is significant at the 0.01 level (2-tailed). * Correlation is significant at the 0.05 level (2-tailed). This table shows the Correlation matrix and collinearity statistics for each of measures of organisational performance in terms of financial performance (return on asset (ROA), return on equity (ROE) and revenues (REVs)), employee commitment and corporate reputation on each of environmental disclosure (ENVD), consumer disclosure (COND), community disclosure (COMD) and employee commitment (EMPD).

In this regard, the Durbin-Watson (DW) is utilized to test the independent of errors (autocorrelation), for a level of significance of 0.05. The result of the Durbin-Watson d value can be a range from 0 - 4. If d value of the Durbin-Watson is equal 2, this leads to the independent of error. For accuracy, the Durbin-Watson d value greater than 3 or less than 1 is definitely reason for concern (Field 2009). The Durbin-Watson d values in these data are close to 2 and they do not be greater than 3 or less than 1. Therefore, autocorrelation does not form any problem with the data. Multivariate regression models are applied for test the relationship between CSR disclosure in annual reports of the years of 2007-2009 using four sectors and organisational performance in terms of financial performance, employee commitment and corporate reputation in the next table and paragraphs.

Related to the relationship between CSR and financial performance, multivariate regression model (1) is employed to test the first hypothesis by using van der warden's transformation data regarding to dependent and continuous independent variables. It can be seen from the table 7. Although, there are obviously stability between the results of this table and the majority of findings of the tables of Pearson correlation and Spearman's Rho (untransformed data and transformed data), the regression results reveals few differences with the tables of Pearson correlation and Spearman's Rho (untransformed data and transformed data). These few differences are likely to be related to a size of sample.

Table 7: Results of the regression models for each measure of organisational performance

Variables	Financial Performance						Employee Commitment		Corporate Reputation

** Significant at the 0.01 level (2-tailed). * Significant at the 0.05 level (2-tailed). This table shows the results from a linear regression of each of measures of organisational performance in terms of financial performance (return on asset (ROA), return on equity (ROE) and revenues (REVs)), employee commitment and corporate reputation on each of environmental disclosure (ENVD), consumer disclosure (COND), community disclosure (COMD) and employee commitment (EMPD). The beta co-efficient and its p-value are presented.

Table 7 shows the results for return on asset, return on equity and revenues to measure financial performance from estimating equation (1) using normal scores. The overall regression model (1) is significant at 1% level ($F = 3.732; 4.335$ and 7.886 respectively). The adjusted R^2 for return on Asst is 0.341, for return on equity is 0.387 and for revenues is 0.566. The values of adjusted R^2 mean that return on asset, return on equity and revenues indexes included in this regression model explain approximately 34%, 39% and 57% from the variations that happen in the CSR scores.

The regression results find a positive, negative relationship and non relationship at the 1% and 5% significance level between dependent and continuous independent variables. Although the level of environmental disclosure is low in the sample, the results regression model (1) indicates that a significant positive relationship between environmental disclosure and return on asset (0.447, p-value < 0.05). The relationship between community disclosure and return on asset (0.529, p-value < 0.01) is also a positive and significant. Furthermore, the regression results model indicated a significantly positive relationship between employee disclosure (0.486, p-value < 0.05) and return on equity. Finally, the results of the regression model reveal that consumer disclosure has a significant and positive impact on revenues (0.325, p-value < 0.05 and). In summary, the results of the regression model (1) does emerge the supported the research hypothesis (1). The results reveal that there are a significant and positive relationship between level of CSR and financial performance at the 1% and 5% significance level.

The explanatory power of the regression varies from approximately 34% for return on asset to approximately 57% for revenues. The results are consistent with a number of studies. The results of Shauki (2011) found that the relationship between CSR contents, format, public confidence, incentives, and effect on financial performance through investment decisions is directly and positively related. In addition, investment decisions via CSR contents, formats, and changes in public confidence are affected by incentives. Kang et al. (2010) examines the extent of different impacts of positive and negative CSR on financial performance of some services companies, it based on positivity and negativity effects of previous results of some studies. They revealed that mixed results enable companies' to make appropriate strategic decision for CSR activities by providing more precise information regarding the effects of each type of CSR activities on financial

performance. Inoue and Lee results (2010) revealed that each type of CSR had a differential impact on both short-term and future profitability that varied across different industries. They indicated that providing information about types of CSR activities to stakeholders such as managers would improve their companies' financial performance. Montabon et al. (2007) indicate that environmental management practices are associated with company performance.

However, a wide range of studies have investigated the relationship between CSR and financial outcomes. Gray et al. (2001) explored the relationship between CSR and the financial performance of the UK's largest companies, and found no convincing relationship between share returns and disclosure. In addition, Cheung and Mak (2010) reveal that high level of CSR can improve a firm's credibility but it can also incur extra cost and reduce firm's profit. Regarding the relationship between CSR and employee commitment, multivariate regression model (2) is used to test the second hypothesis by using van der warden's transformation data regarding to dependent and continuous independent variables. Table 7 presents the regression results using normal scores for investigating the association between CSR disclosure and employee commitment. The overall regression model (2) is significant at 1% level ($F = 3.401$). The adjusted R^2 is about 31%. The value of adjusted R^2 indicates that almost 31% of the variation in the employee commitment scores between the firms can be explicated by categories of CSR scores included in the regression model. The regression results indicate that the non-significant relationship at the 1% and 5% significance level, as predicted, between CSR disclosure and employee commitment.

One conclusion does emerge the rejected second research hypothesis in the results of the regression model (2) that level of CSR does not affect employee commitment, in spite of the findings that are revealed in the tables of Pearson correlation and Spearman's Rho (untransformed data and transformed data). Although the overall regression model (2) is significant at 1% level, none of the other main impacts are significant since the F-statistic is small. This result may refer to the size of sample. However, some prior studies have identified how CSR and CSR can affect employees in terms of the commitment (Branco & Rodrigues 2009; Hsu 2006). These studies supported the notion that CSR and CSR can increase its attractiveness as an employer.

Related to the relationship between CSR and corporate reputation, multivariate regression model (3) is utilized to test the third hypothesis by using van der warden's transformation data regarding to dependent and continuous independent variables. The table 7 shows the regression results using normal scores for the CSR and corporate reputation based on 'extent' of disclosure and reputation (scales). The overall regression model (1) is significant at 5% level ($F = 13.759$). The adjusted R^2 for the regression model (3) is 71.7%. As mentioned above, the value of the adjusted R^2 of the variation in the corporate reputation scores between the firms can be interpreted by categories of CSR scores included in the regression model, in other word the dependent variables (corporate reputation index) cannot explain 28.3% (100% - 71.7%) from the variations that happen in independent variables (level of CSR disclosure). The regression model indicates a significant and positive relationship, as predicted, between consumer disclosure and corporate reputation (0.525, p-value < 1%). In addition, the results of the regression reveals a significant and a positive relationship between employee disclosure and corporate reputation (0.500, p-value < 1%). However, the non-significant relationship between environmental disclosure and community disclosure with corporate reputation is revealed.

Eventually, the results of the regression model (3) support the third research hypothesis. The results reveal that there are a significant and positive relationship between level of CSR and corporate reputation at the 1% significance level. On the other hand, the non-significant relationship between both the levels of environmental disclosure and community disclosure with corporate reputation measures in the sample. Although some evidences in the literature review to date appear a mixed relationship between information disclosure and a company reputation using different methods, the results of this research

hypothesis in this paper are consistent with the concept of stakeholder theory, which predicts a positive relation between high level of CSR and a company reputation. The positive relationship appears due to the following reason. CSR is particularly important in enhancing the impacts of CSR on a company reputation (Branco & Rodrigues 2006). CSR is used to protect, enhance or create a competitive advantage and a company image or reputation, because CSR is a communication instrument (Hooghiemstra 2000). In this regard, companies probably use CSR to assess their reputation under conditions of incomplete information through their stakeholders group, because CSR is considered as one of the informational signals (Teece et al. 1997). Besides the previous reason, “creating a positive image may imply that people are to a great extent prepared to do business with the firm and buy its products” (Branco & Rodrigues 2006, p. 125). Toms (2002) reveals that companies that implement monitor and disclose environmental activities in their annual reports could create and contribute good environmental reputation.

SUMMARY AND CONCLUSION

This paper analyses the relationship between CSR and organisational performance in terms of financial performance, employee commitment and corporate reputation by a sample of the Libyan companies in four sectors (manufacturing sector, banks and insurances sector, services sector and mining sector), using a theoretical framework which combines stakeholder theory. The results in this paper indicate that companies exhibit greater concern to improve financial performance and corporate reputation via an increase of CSR information in annual reports. In this regard, to improve financial performance in these sectors, there is greater concern for environmental disclosure, consumer disclosure, community involvement disclosure and employee disclosure, whereas there is greater concern for consumer disclosure and employee disclosure to improve corporate reputation. On the other hand, there is no concern for each categories of CSR to improve employee commitment. Hence, the results of this paper provide a good support for the use of a combination of stakeholder theory with resource-based perspectives to explicate the impact of CSR on some organisational performance by Libyan companies.

This paper contributes at least in two ways to research: first, it extends previous research that links level of CSR with organisational performance using a combination of institutional and resource-based perspectives. Second, it reveals the nature of the relationship between level of CSR and organisational performance in spite of a lack of CSR data in annual reports of developing countries comparing with developed countries. However, this paper has a number of limitations: first, this paper focuses on only CSR in annual reports, although these companies use other mass communication mechanisms. Finally, it is probably content analysis issues related to the level of subjectivity that are entailed in the coding process. Therefore, future research should manage the limitations of this study.

UNITED STATES AND INTERNATIONAL STUDENTS: A COMPARATIVE LEARNING OUTCOME STUDY

Farideh A. Farazmand, Lynn University
Robert D. Green, Lynn University

ABSTRACT

Globalization and student career preparation are major priorities for business schools, and are critical for hiring criteria by businesses. This study examines and determines differences between two diverse student groups – United States and international – as to their applied projects' learning outcomes. The sample is from a university with a diverse student population that also encourages applied course projects and other "real world" learning experiences. The results found significant differences between the two groups. From the students' self-report and the instructor's results, international students had higher learning outcomes than U.S. students.

INTRODUCTION

With preparing students for successful careers, specific standards must be met, e.g., assurances of learning (AACSB International Accreditation Coordinating Committee, 2007). Applied teaching-learning strategies have been used to achieve such standards and learning outcomes (Frontezak and Kelly, 2000). Along with student preparation, globalization is another critical criterion for business hiring. Cultural competency of college students is an important factor for a success in global marketplace (Zhao, Kuh, Carini, 2005). As universities provide diversity opportunities for student learning, e.g., recruiting and admitting international students, there is a pedagogical need to determine the impact on the diverse student populations learning outcomes (Geringer, Stratemeyer and Canton, 2009; Grayson, 2005).

The purpose of this study is to examine the differences between United States and international students' experiences and their performance in courses that include applied learning projects. Therefore, are there differences between U.S. and international students' learning outcomes? This study includes a literature review, the methodology and data analysis results and discussion of the findings.

LITERATURE REVIEW

Applied project strategies supplement explicit classroom learning objectives by an experiential service project and a reflection assignment for students to bridge theory and application (Dudderar and Stover, 2003). This integration of education, experiment and service not only enhances students' learning, but also provides each student with a sense of achievement, satisfaction and effectiveness as a community member, in addition to fulfilling degree requirements (Easterling and Rudell, 1997; Holland, 2001; Titus and Petroschius, 1993). The continuity of classroom learning to the real world opens up a broader perspective to the students with insights, awareness, involvement and positive change in attitude, behavior, self-esteem and personal growth, which all constitute solid foundation for future career success (Easterling and Rudell, 1997).

High schools and colleges have adopted applied projects to their curricula for development of students' knowledge, skill and personality (Butin, 2003; Dudderar and Stover, 2003; Mastrangelo and Tischio, 2005; Steinke and Fitch, 2007; Sternberger, Ford and Hale, 2005; Zlotkowski, 1996). Business programs have also included live project learning pedagogy to their curricula (Geringer, Stratemeyer and Canton, 2009; Klink and Athaide, 2004) for development of the competency of business school graduates,

especially for skills such as decision making, problem solving, team work and written and oral communication (Geringer, Stratemeyer and Canton 2009; Lamb, Shipp and Moncrief 1995).

Geringer, Stratemeyer and Canton (2009) expand on Klink and Athaide (2004) recommendation by requiring, “the students to look beyond marketing related problems” (2009, p. 4) and allowing for individual work as well as teamwork in a service project. The learning objectives of the service-learning project included academics, skills, attitudes, career development and civic responsibilities. Geringer et al. state that assessment of the learning outcomes of the service learning project indicated that, “all objectives or student learning outcomes were achieved to some extent” (2009, p. 6). Awareness, civic responsibilities and commitment to volunteering of students were impacted the most and career development was impacted to some degree. Assessment results showed enhancement of students’ knowledge and understanding of the principles of marketing and leadership and communication skills. However, Geringer et al. (2009) point to relatively large standard deviation of the enhanced learning item on the questionnaire indicating variation in the effectiveness of the service-learning method of teaching for different students. The authors recommend further research on, “how the diverse student populations perform in service learning assignment” (Geringer et al. 2009, p. 9).

Farazmand, Green and Miller (2010) measure the learning outcomes of four marketing courses (Marketing Communications, Global Marketing, Marketing Research, Business Marketing Management) in two different semesters. The courses were taught with a real live project in 2005 and without a real live project in the prior semester. The authors indicate that the students’ average course grades were higher for the semester with the live project. In another study, Farazmand and Green (2012) measure and compare the impact of applied project teaching pedagogy between male and female students. The authors identify differences in teamwork and learning by gender. Also, Green and Farazmand (2012) examine the learning outcomes of courses with live-case study projects for students who have had a prior internship experience and those who have not. They find that prior internship experience does improve applied project learning outcomes.

Although, the positive impacts of applied project learning outcomes have been measured for the American students, but the impacts of such pedagogy on learning of the international students have not been examined. Considering significant presence of international students on college campuses, examining the learning experiences of international students in colleges will contribute to success of their recruitment strategies (Grayson, 2005). Grayson (2005) examines the learning differences of 477 international and 781 Canadian freshman students with pre-entry characteristics, formal institutional experience, informal experience as independent variables and GPA measuring the learning outcome as the dependent variable. Grayson (2005) finds no significant differences in the GPA and program success of Canadian and international students. However, he mentions the importance of examining the impact of different policies, teaching strategies and out-of-classroom student activities on international students’ skills, retention and specific educational outcomes.

Green and Farazmand (2010) examine the differences in United States and international students’ performances in courses with live project. While their study shows the positive effects of applied project on all students’ learning outcomes, their results however indicated significantly higher learning outcomes for international students relative to the U.S. students. This study extends Green and Farazmand’s (2010) work to compare International and United States students’ learning outcomes in applied learning courses and determine factors that influence students’ success in applied project courses.

METHODOLOGY AND DATA ANALYSIS RESULTS

The applied projects were conducted during two academic years, or four semesters in five upper-level Marketing courses. These courses are Consumer Behavior, Marketing Communications, Global

Marketing, Marketing Research and Business Marketing Management in the College of Business and Management. Each course was structured the same with the exception of the type of marketing project. Class sessions were on Tuesdays and Thursdays for 75 minutes. Depending on the semester, examinations were 30% of the course grade, course project ranged from 30% to 50%, and other assignments 20% to 40%. The courses allocated time of approximately 60% classroom meetings and 40% field research and project development.

This study includes 143 students who participated in the applied projects during the four semesters. The sample includes 89 U.S. students and 54 international students. There were 80 males and 63 females. The vast majority was College of Business and Management students (95.1%), and only six students were from the College of International Communications (4.2%) and one for the College of Liberal Studies (0.7%). While there were no freshmen who participated, there were 12 sophomores (8.4%), 80 juniors (55.7%) and 51 seniors (35.7%). More than two-thirds of the students lived off-campus (67.8%) and the remaining students lived on-campus (32.2%). Most students (58.0%) had not taken a required internship course. About one-half of the students (53.8%) did not belong or were associated with a University organization, e.g., student government, fraternity/sorority, athletic team. About four out of ten students did not have a paying Summer job (42.6%) but most of those who did worked 30 or more hours (28.7%). During the semester of the course, most students did not work (73.4%) but most of those who did worked less than 20 hours (18.9%).

Students were given three surveys during each semester. First was a pre-project survey (pre-test) at the beginning of the semester. The students provided self-reported demographic information (e.g., gender, citizenship), campus experiences (e.g., student activities), educational experiences (e.g., credits earned, internship completion), and their perception of examinations and applied projects with six 5-point Likert-type scale items. Second was a mid-project survey (mid-term test). This survey was completed after the textbook assignments and before beginning the project in which the six items (5-point Likert scale) was asked again. Third was a post-project survey (post-test) at the end of the semester. The six items were asked but the verb tense was changed from future tense to past tense. See Table 1, Panel A for the six post-test items. As shown in the table, these items were researchers' developed and measures students' applied project perceptions and experiences as (1) knowledge, (2) skills, (3) personal development, or (4) both knowledge and skills. Additional data were included as to the teams' ranking of each member with no two students in the team having the same ranking and was used to compute the student's applied project score. Furthermore, other data provided for the study were from the instructor or the University, e.g., examination and applied project scores, cumulative grade point average.

The data were analyzed and the results are reported by which a comparison is made between United States students ($n = 89$) and the international students ($n = 54$) using t- Tests. Learning outcomes (dependent variable) are determined by two measures – the students and the instructor. The post-project survey (post-test) is used to determine the students' learning outcomes. Students completed a six-item questionnaire that was measured by a 5-point scale (1 = strongly agree to 5 = strongly disagree). All mean scores were lower (more agreeable) for the international students than the U.S. students, as well as for the total mean score (unweighted) for the six items. Four of the six items were significantly different. Knowledge and two skills items were the least significant ($p < 0.05$), and personal development item was the most significant ($p < 0.001$). The mean score for the six items was significant ($p < 0.01$). Neither of the knowledge and skills items was significant. See Table 1, Panel A. To further examine the comparison between the two groups, an analysis of the project scores (1 = A to F = 5) was completed. The finding shows no significant difference. However, international students performed slightly better (higher grade) than the U.S. students. See Table 1, Panel B.

Table 1
Project Score Comparisons: U.S. and International Students

Panel A: Student-Reported (Post-test)				
Items	United States Students Mean	International Students Mean	Standard Deviation	Mean Difference
Learned more about Marketing in this course than a Marketing course without a service (applied) learning project. (<i>Knowledge</i>)	1.82	1.54	0.605	0.28***
Developed better or new skills in this course than a Marketing course without a service (applied) learning project. (<i>Skills</i>)	1.87	1.59	0.659	0.28***
Look forward to doing another service (applied) learning course project in the future. (<i>Personal Development</i>)	2.42	1.59	0.813	0.83*
Look forward to working in a team in the future. (<i>Skills</i>)	2.45	2.00	1.046	0.45***
Did better in this course that had both examinations and a service (applied) learning course project than without such as project. (<i>Knowledge and Skills</i>)	2.17	1.89	0.816	0.28
A service (applied) learning project has benefited me more in meeting my career goals than a course without such a project. (<i>Knowledge and Skills</i>)	1.93	1.74	0.701	0.19
Mean Score for the 6 student-reported items	2.11	1.74	0.528	0.37**

Panel B: Instructor-Reported				
Item	United States Students Mean	International Students Mean	Standard Deviation	Mean Difference
Project grade	2.21	1.94	1.089	0.27

Note: * $p < 0.001$, ** $p < 0.01$ and *** $p < 0.05$ indicate significance levels.

DISCUSSION OF THE FINDINGS

The research setting provided an opportunity to examine the differences as to “how the diverse student populations perform in service-learning assignments” (Geringer, Stratemeyer and Canton, 2009, p. 9), e.g., local (United States) and international students’ learning outcomes. The results have several implications to learning differences between the two groups. First, there are clearly better international students’ learning outcomes. The self-reported mean scores were all lower (better learning) by the international students as applicable to knowledge, skills, and knowledge and skills measures (see Table 1, Panel A). Furthermore, the instructor-evaluated project mean score was lower (better learning) for international students (see Table 1, Panel B). Generally, members were not assigned to teams, and teams were diverse. As a result, these members learn to perform in a diverse setting. Moreover, based on the scores learning might have improved because of this diversity, e.g., international students’ commitment to learning and U.S. students becoming competitive by learning.

Globalization and student career preparation are major priorities for business schools, and are critical for hiring criteria by businesses. This study has examined and determined differences between two diverse student groups – United States and international – as to their applied projects’ learning outcomes. The sample was from a university with a diverse student population that also encourages applied course projects and other “real world” learning experiences. The results found significant differences between the two groups (t-Test analysis). From the students’ self-report and the instructor’s results, international students had higher learning outcomes than U.S. students. However, having diverse teams (U.S. and international students) may have improved both groups’ learning.

This study has certain limitations. It includes a sample from one academic unit at one university, and the results are not applicable or generalizable for other academic units and universities. Furthermore, the participants were undergraduate students, and different results might be found for graduate student learning. An international student was defined as a non-U.S. citizen, and no consideration, or analysis of specific comparisons between and for different global regions, e.g., Latin America, Europe, Middle East, Africa, Asia. However, these limitations offer future research opportunities. For example, “how the

diverse student populations perform in service-learning assignments” (Geringer, Stratemeyer and Canton, 2009, p. 9) in non-business academic units? Are there differences in graduate courses? Are there differences between global regions? This study is the beginning, not a conclusion to better understand globalization and student career preparation, and student diversity and applied projects learning outcomes.

THE PRODUCTIVITY PARADOX: A PHILOSOPHICAL ANALYSIS AND ITS IMPACT IN MANAGEMENT

Leslie M. Bobb, New York Institute of Technology
Steven Shapiro, New York Institute of Technology.
Peter Harris, New York Institute of Technology

ABSTRACT

The Productivity Paradox whereby productivity and profits are not directly related has befuddled the field of management and its disciplines of management science and operations management for a while now. It has seriously affected the methodology and framework of the measurement of productivity, so much so, that it threatens the philosophical approaches to the subject material and causes a rift between various practitioners of management science and operations management. Son in a 1990 and subsequent 1994 paper, is probably the first to propose an alternate performance measure which correctly relates the various factors involved in productivity and consequently remedies the productivity paradox. This paper will argue in favor of such a proposal and demonstrate the various philosophical implications.

AN INVESTIGATION OF PERFORMANCE OF EMERGING MARKET DIVERSIFIED EQUITY AND BOND FUNDS

Halil Kiyamaz, Rollins College

ABSTRACT

This paper examines the performance of diversified emerging market funds and emerging market bond funds during the period of January 2000 and November 2011. The emerging market funds provide U.S. investors an alternative to expose their portfolios. Emerging markets differs from developed markets on a wide range of market and economic characteristics, including size, liquidity, and regulation. The results show that diversified emerging market funds generate some significant alphas for their investors during the study period. Emerging market bond funds, on the other hand, do not provide any significant positive alphas; mostly alphas are negative. An analysis of sub-period performance suggests that these funds do not consistently provide excess returns, showing great variations from one period to another.

TESTS OF EFFICIENCY IN FOREIGN EXCHANGE MARKETS

Peter Harris, New York Institute of Technology
Scott Liu, New York Institute of Technology
John Malindretos, New York Institute of Technology

ABSTRACT

The paper uses an efficiency specification model of the spot and forward foreign exchange markets and tests the random walk, the general efficiency, and the unbiasedness hypotheses (the forward rate is usually viewed as an unbiased predictor of the future spot rate) by utilizing a regression estimation and many different specification and diagnostic test for the series and the error term (residuals). The random walk hypotheses cannot be rejected. The unbiased forward rate hypotheses has been failed to be rejected in Germany, Canada, Belgium, and Netherlands, but even though, more research is needed in this area to be able to have better statistical inferences.

ASSESSING THE RELATIVE EFFICIENCY OF JORDANIAN PUBLIC HOSPITALS USING DATA ENVELOPMENT ANALYSIS AND PABON LASSO DIAGRAM

Moh'd M. Ajlouni, Arab Open University, Amman, Jordan

Malik Al-Natour, Yarmouk University, Irbid, Jordan

Rami J. Anshasi, Yarmouk University, Irbid, Jordan

ABSTRACT

This study aims at investigating and measuring the relative efficiency of public hospitals performance in Jordan, during the period (2006-2008), using DEA and Pabon-Lasso Diagram. The results indicate that the average efficiency of those hospitals is varied and ranges between (73%) to (100%). The average of the relative efficiency of the sample hospitals over the study period is 94%. Of 15 hospitals, the number of efficient hospitals increased from 7 in 2006 to 9 in 2007, but decreased to 8 in 2008. The results are compared with old efficiency scores of the same hospitals reported in the literature. This comparison leads to signify that the efficiency of public sector hospitals in Jordan is varied over time, due to decreasing public expenditures on health care per capita. However, the results concerning ratio analysis in explaining efficiency are inconsistent; implying that these institutions are either having poor management or they treat long stays diseases.

INTRODUCTION

The concept of performance brings together the concepts of quality, efficiency and effectiveness. Hospitals, amongst other organizations, need to know how well they are performing and to have effective means of assessing and improving the quality of care they are providing. This requires measures that are meaningful, interpretable, and of demonstrable value in helping to improve performance (Thomson et al., 1997). Estimating efficiency in the medical field is more difficult than in other fields since the output (health gain, cure or marginal health improvement) is difficult to measure, due to the non-parametric measurable characteristics of hospitals' products. Performance indicators for hospitals are important for internal management to evaluate and improve various hospital functions and for external stakeholders like investors, insurers, patients and public.

This study provides evidence on the performance efficiency of fifteen public hospitals in Jordan during the period (2006-2008), using a multi-criteria non-parametric analysis technique known as Data Envelopment Analysis (DEA), as well as plotting the results on the Pabon Lasso graph to interpret efficiency. It aims at identifying the relatively efficient hospitals and the relatively inefficient ones, based on DEA. In addition, the results will be compared with Al-Shammari's (1999) results of the same fifteen public hospitals 20 years ago (1991-1993). The Pabon Lasso model has also proved to be one of the most useful for comparing the performance of different hospitals. The results of this study are expected to be beneficial to policy makers and the relevant hospital management to develop an assessment system to

measure performance of their hospitals. The remainder of the study is presented as follows: Part II reviews the theoretical background of the study, including: performance measurement, hospital efficiency, ratios, and DEA. Part III reports the Jordanian health sector as the institutional background of the study. While part IV is devoted to the data, methodology, empirical results and analysis of the findings. Finally, part V concludes the study and provides recommendations.

THEORETICAL FRAMEWORK

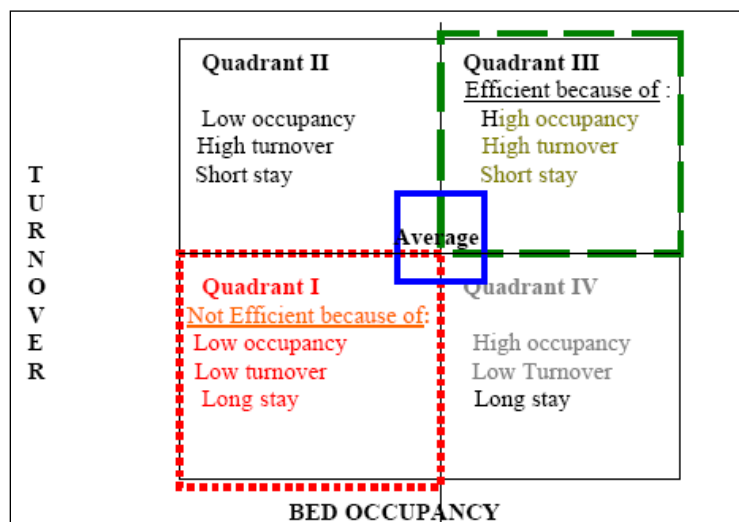

There are different models of hospital performance assessment. These are (WHO, 2003) (1) the Balanced ScoreCard (BSC), which integrates four performance dimensions: financial dimension, customer dimension, internal business process and learning and growth. This model is adopted by Canadian hospitals (Chan and Ho, 2000). Ba-Abaad (2009) provides a review of literatures employed this model. (2) The Danish Model which focuses on (a) a clinical perspective, such as admission, assessment, investigation, evaluation, discharge, follow-up; (b) the patient's perspective comprising information, communication, coordination, continuity, patients' rights, patient safety; and (c) an organizational perspective, including public information, leadership, human resources, research, education and risk management; and (3) Quality Indicator Project (Maryland Hospital Quality Indicator Project (MHA QI Project®), which is a clinical, outcomes-based research project that allows health care industry participants to understand and improve their performance at their facility. It is a complex model as it incorporates hundreds of measures making it the largest performance quality analysis program available. There is no consensus about the appropriate performance measurement approach in the health services (Veillard et al., 2003). The most common models are based on ratio analysis and Pabon-Lasso diagram, accounting methods, and frontier approaches (Somanathan, 2004). These are explained in the followings.

1. Ratio Analysis And Pabon Lasso Diagram

Ratio measurements include the number of outpatient visits per doctor or nurse; or in the case of inpatient care, average length of stay, bed occupancy and turnover rates. There are three main hospital indicators to assess performance (Sherman, 1984). These are (1) Bed Occupancy Rate (BOR), which measures the percentage of beds occupied by the patients in the year, reflecting the efficiency in the use of hospital resources. (2) Bed Turnover Rate (BTR), which measures the average number of inpatients per bed in the year, as an indicator of the efficiency of hospital resource use. (3) Average Length of Stay (ALOS), which measures the average duration of inpatient hospital admissions (mean number of days from admission to discharge). Pabon Lasso (1986) developed a method of graphical analysis that allows an easier combination of these three hospital efficiency indicators for meaningful comment on the efficiency with which hospitals are operating. Pabon Lasso graph is a technique that interprets hospital efficiency using such indicators, which is a common practice among hospital managers around the world. Pabon-Lasso diagram, see figure 1, utilizes such ratios of hospitals for comparison (Bahadori et al., 2011), to plot the hospitals in the four quadrants of the figure.

Quadrant I, surrounded by dotted lines, is characterized by low bed occupancy rate (BOR) and low bed turnover (BTO) and therefore under-utilization. This may be related to a higher number of beds than needed and/or a low demand for hospitalization. Low (BTO) and low (BOR) indicate a surplus of hospital beds relative to the existing demand. Quadrant II is characterized by a higher than average (BTO) and a lower than average (BOR). This may be related to a higher number of beds than needed and/or unnecessary hospitalizations, and/or a high number of normal deliveries.

Figure 1: Pabon-Lasso Diagram

This figure shows the four quadrants Pabon Lasso Diagram. These quadrants are formed by the intersection of the average bed occupancy rate (BOR) and the average bed turnover rate (BTO) for the same category of hospitals. Source: Pabon Lasso (1986).

High BTO and low BOR characterize the unnecessary hospitalizations, an oversupply of beds, or using beds for simply observing patients. Quadrant III, surrounded by broken lines, is characterized by an efficient utilization of resources because the occupancy and turnover are higher than the average. High BTO and high BOR characterize hospitals that have reached an appropriate level of efficiency, with relatively few vacant beds at any time. Quadrant IV is characterized by a higher than average bed occupancy and a lower than average turnover. A high proportion of severe patients and or a high proportion of long term cases, and or unnecessary long stay may cause this situation. The area near the centre is where average hospitals are located. Hospitals have low BTO and high BOR are serving patients with serious, chronic illnesses or have an unnecessarily long average length of stay (Pabon Lasso, 1986).

Plotting the hospitals according to occupancy and turnover makes sense only if the hospitals have similar characteristics. Public hospitals are likely to accept more complicated cases than private hospitals and therefore they should be considered separately. Once the hospitals with the same characteristics are plotted on the Pabon Lasso graph, it is possible to group them in the four quadrants and to rank them according to average, lower or higher than average utilization. However, efficient utilization should be interpreted with caution. Variation within the same category of hospitals distorts the average. In addition, efficient utilization does not equate to performance in terms of standard and quality of care (Govender et al., 2004).

Accounting Methods

Accounting methods provide unit cost estimates of, for example, admissions, bed-days, surgical procedures and outpatient visits. The main advantage of this method is that the average service cost estimates are often used in the financial analysis documents such as National Health Accounts (Barnum and Kutzin, 1993). Statistical methods use ordinary least square (OLS) regression analysis that can handle multiple inputs and outputs that hospital efficiency analysis requires. However, these variables are not directly useful in identifying inefficiencies within a hospital (Sherman, 1984).

DEA Model

Frontier approaches include Stochastic Frontier Analysis (SFA) and Data Envelopment Analysis (DEA). The choice of measurement method depends largely on the audience, the use of the estimates and the data available (Rianna, 2004). This study will use DEA. DEA is an efficiency measurement procedure developed by Charnes, Cooper and Rhodes (1978) to evaluate the efficiency of public sector non-profit organizations. It is a linear programming based model which evaluates the relative efficiency of decision making units (DMUs), with multiple inputs and outputs. DMUs refer to the collection of firms, departments, divisions or administrative units with the same goals and objectives, and which have common inputs and outputs. DEA identifies a subset of efficient "best-practice" DMUs and for remaining DMUs, the magnitude of their non-efficiency is measured by comparing to a frontier constructed from the efficient DMUs. In short, DEA provides management with information regarding the relatively best practice hospitals in the observation set and locates the relatively inefficient hospitals by comparison with the best practice ones. In addition, it indicates the magnitude of these inefficiencies.

The DEA approach constructs a hypothetical composite unit which is the best-practice unit made up of a subset of units that should be emulated by a given inefficient unit in order to improve the efficiency of its operation. That is, the performance of each DMU is measured relative to the performance of all other DMUs. The unit being evaluated can be judged relatively inefficient if the composite unit requires less input to obtain the output achieved by the unit being evaluated, or judged relatively efficient if the composite unit requires as much input as the unit being evaluated. DEA results help in identifying the relatively inefficient DMUs and providing insights into ways to improve productivity of these relatively inefficient units while maintaining or even increasing the volume of services provided by DMUs (Coelli et al., 2005). DEA is an advantageous hospital efficiency measure over other measures, mentioned above, because it is consistent with the economic theory in that it locates inefficiencies rather than measuring efficiency based on averages. Also, it can simultaneously consider multiple inputs and multiple outputs, and direct management's attention toward the particular factors that exhibit the greatest effect on operational efficiency. In addition, it does not require a common measurement unit for the factors. Finally, it can determine where resources might best be applied in order to reduce inefficiencies (Rutledge et al., 1995).

Overview of Health System In Jordan

Health care services in Jordan are provided by the following providers (MOH, 2006, 2007 and 2008): (1) The public sector, including the Ministry of Health (MOH), the Royal Medical Services (RMS) for the military and their dependents, the Jordan University Hospital (JUH) and King Abdullah University Hospital (KAUH) of Jordan University of Science and Technology (JUST). (2) The private sector, and (3) the international and charitable sector. Table 1 provides key data about the demographic and health related ratios during the period (2004-2008).

MOH is the main institutional source of primary and hospital care in Jordan. According to the MOH (2008), MOH operates an extensive primary care network, consisting of 240 Peripheral health clinics, 375 primary health centers, 416 maternal and child health clinics, 68 comprehensive health centers, 313 dental clinics, and 12 chest disease centers. Table 2 presents some data about hospitals and the main ratios during the period (2004-2008).

Table 1: Key Data about the Demographic and Health Related Ratios during the Period (2004-2008)

Country Demographic and Health Data	2004	2005	2006	2007	2008
Population	5,350,000	5,485,000	5,600,000	5,723,000	5,850,000
Adult Male Illiteracy Rate (%of15+Years of Age)	5.6	4.8	5.1	4.3	4.1
Adult Female Illiteracy Rate (%of15+Years of Age)	15.1	13.1	13.7	11.6	11.4
AVERAGE	10.3	9	9.3	7.9	7.7
Crude Birth Rate (Per 1000 Population)	29	29	29.1	29.1	28
Population Growth Rate	2.6	2.5	2.3	2.2	2.2

DATA AND ANALYSIS

This section starts by reporting the data used in the study, then presenting the results of DEA efficiency scores, Pabon Lasso graph and, finally, discussing the results.

The Data

The data used in this study is obtained from the Annual Statistical Reports published by the MOH for 15 public hospitals for the period (2006-2008). Hospitals are shown in the tables and are coded with letters (A, B, C, D... O). In fact hospital A is the largest public hospital in Jordan, with B is the second largest and so on. Since DEA operates better when the number of DMUs exceeds the number of the combined total of inputs and outputs by at least twice (Drake and Howcroft, 1994), 3 inputs and 3 outputs are selected for the 15 hospitals. The input measures, shown in table 3, are: (1) Number of bed days, which is the number of beds multiplies by 365 day; (2) Number of physicians, which includes all physicians who are full-timers, no part-timers are employed; and (3) Number of health personnel, such as nurses, lab technicians, physical therapists and pharmacists, who are full-timers, no part-timers are employed.

The Pabon Lasso model is also applied to assess the performance of the fifteen public hospitals in Jordan. This type of analysis is used for quick identification of poorly performing hospitals and finding appropriate strategies to correct the inefficiency. The indicators were also derived from the Annual Statistical Reports published by the MOH for 15 hospitals for the period (2006-2008). The indicators are presented in table 5.

Table 3: Inputs Measures for each Hospital in each Year during the Period (2006-2008)

Hospital Code & Name / Outputs	Bed Days			Physicians			Health Personal		
	2006	2007	2008	2006	2007	2008	2006	2007	2008

This table shows hospital ratios for the sample that will be used in Pabon Lasso Diagram during the period 2006-2008.

Efficiency Scores

This study uses DEA online software to obtain the results. The DEA efficiency scores for the 15 hospitals in each year during the period (2006-2008) are documented in table 6.

Table 6: DEA Efficiency Scores for each Hospital in each Year during the Period (2006-2008)

Hospital Code & Name	DEA Efficiency Scores			
	2006	2007	2008	AVERAGE
A (Al-Basheer)	100.0%	100.0%	100.0%	100.0%
B (Princess Basma)	100.0%	100.0%	100.0%	100.0%
C (Al-Zarqa)	100.0%	100.0%	100.0%	100.0%
D (Al-Husein/Salt)	100.0%	100.0%	100.0%	100.0%
E (Al-Mafraq)	94.9%	88.0%	89.8%	90.9%
F (Jarash)	100.0%	100.0%	100.0%	100.0%
G (Ma'an)	100.0%	100.0%	100.0%	100.0%
H (Al-Iman/Ajloun)	99.9%	100.0%	100.0%	100.0%
I (Al-Karak)	85.8%	93.3%	100.0%	93.0%
J (Al-Tutanjee / Madaba)	100.0%	100.0%	97.2%	99.1%
K (Al-Ramtha)	89.2%	77.1%	72.9%	79.7%
L (Al-Shunah-South)	78.9%	93.2%	89.4%	87.2%
M (Ghor Al-Safi)	98.2%	100.0%	95.5%	97.9%
N (Abu-Obaidah)	94.2%	92.3%	79.3%	88.6%
O (Mua'th Bin Jabal)	90.5%	99.8%	28.1%	72.8%
AVERAGE	95.4%	96.2%	90.1%	93.9%

This table shows hospital efficiency scores as a product of DEA computation during the period 2006-2008.

In table 6, the relatively efficient best-practice hospitals are given an efficiency score of 100%, while the relatively inefficient ones are given efficiency score less than 100%. In 2006, 8 of the 15 hospitals have

inefficiencies in one or more aspects of their operations. The distribution of inefficient hospitals over efficiency scores ranged from 78.9% to 99.9%. The relatively most inefficient hospital with 78.9% efficiency score indicates that efficient hospitals can obtain at least the level of each output that this hospital obtained by having available no more than 78.9% of input resources required by such hospital. This also means that this hospital should be able to produce its actual output level with 78.9% of the available resources, i.e. or using 21.1% less of each input.

However, the number of inefficient hospitals decreased in 2007 to 6 hospitals. 4 of the inefficient hospitals in 2006 increased their scores in 2007. Nevertheless, in 2008, inefficient hospitals increased to 7 hospitals, with 4 hospitals remained relatively inefficient during the period of the study. Unexpectedly, one hospital witnessed a sharp decrease in its efficiency score in 2008 with a score of 28%.

Table 7: The Potential Reduction in the Usage of Inputs and/or Increase the Outputs for Each Inefficient Hospital during the period (2006-2008)

Hospital Code & Name		INPUTS								
		Bed Days			Physicians			Health Personal

N (Abu-Obaidah)		-6%	-8%	-21%	-5%	-8%	-21%	-54%	-30%	-39%
O (Mua'th Bin		-10%	-1%	-74%	-19%	-8%	-72%	-60%	-78%	-72%
Hospital Code & Name		OUTPUTS								
		Patient Days			Minor Operations			Major Operations		
		2006	2007	2008	2006	2007	2008	2006	2007	2008
A (Al-Basheer)										
B (Princess Basma)										
C (Al-Zarqa)										
D (Al-Husein/Salt)										
E (Al-Mafraq)					154%	1%	83%	194%	64%	162%
F (Jarash)										
G (Ma'an)										
H (Al-Iman/Ajloun)										
I (Al-Karak)		2%			32%					
J (Al-Tutanjee /		0%		2%						
K (Al-Ramtha)		11%		4%						
L (Al-Shunah-					15%	153%	161%	140%	24%	27%
M (Ghor Al-Safi)					176%		13%	197%		97%
N (Abu-Obaidah)					50%			91%	52%	41%
O (Mua'th Bin								65%	63%	35%

This table shows the potential reductions in the inputs and/or increase the outputs for each inefficient hospital during the period (2006-2008). (-) indicates potential reduction in the usage of inputs, (+) potential increase in the production of outputs, and (shaded cell) indicates efficient use of the designated variable.

The results are almost consistent with Al-Shammari (1999), who measured the same 15 sample hospitals during the period 1991-1993. He reported that the number of inefficient hospitals decreased from 8 in 1991 to 6 hospitals in 1992 and further to 4 inefficient hospitals in 1993. In addition, comparing the efficiency of the same hospital between 1993 (Al-Shammari, 1999) and 2008 (this study) shows that the number of efficient hospitals decreased from 11 in 1993 to 8 hospitals in 2008; and, consequently, the average efficiency score dropped from 98% in 1993 to 90% in 2008. In fact, 6 hospitals (A, C, D, F, G and I) maintain their 100% score of efficiency; 2 hospitals (B and H) improved their efficiency scores; and 7 hospitals (E, J, K, L, M, N and O) deteriorated their efficiency scores, particularly 3 hospitals (M, N, and O) which were fully efficient in 1993.

This result might be explained by that the level of fixed and working capital investments in the public hospitals had not been enough to match the higher level of population growth rate. While the annual population growth rate is around 3%, government expenditures on public health care and hospitals is remain almost constant, taking into consideration the inflation rate in health care materials and supplies.

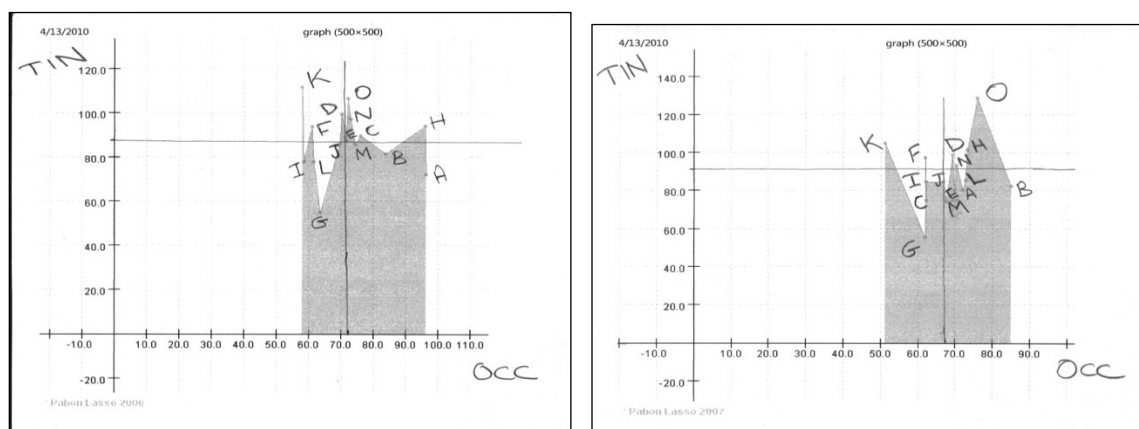

In addition to the identification of inefficient hospitals and their efficiency reference set, the DEA online software provides additional insights on how to improve the efficiency of the hospital. Table 7 provides the results that pertain to either the potential reduction in the usage of inputs (-) or the potential increase in the production of outputs (+) to increase efficiency for each inefficient hospital during the period (2006-2008).

Table 7 suggests that, to improve the efficiency, practices (in Al-Mafraq, Al-Karak, Al-Tutanje/Madaba, Al-Ramtha, Al-Shuna-South, Ghor Al-Safi, Abu Obaidah and Muath Bin Jabal hospitals) should work either to reduce the inputs of bed days, physicians and health personnel, and/or to increase the potential output of patient day, and minor and major operations.

Pabon Lasso Diagram

Pabon Lasso graph divides hospitals into 4 categories, as shown in figure 1. The results for the 15 hospital performance assessment by Pabon Lasso are shown in figure 2. The three graphs show that it is more useful to compare the indicators of the hospitals with one another than the indicators of each hospital used in isolation.

Figure 2: Pabon Lasso Graph for the 15 Hospitals for Each Year during the Period (2006-2008)

Pabon Lasso Pabon Lasso 2007 Pabon Lasso 2008

These figures show Pabon Lasso diagrams for the 15 public hospitals in years 2006, 2007 and 2008, respectively. TIN is bed turnover ratio and OCC is the occupancy rate. The alphabetical letters (A, B, C ...,and O) in the diagrams are designated for hospital names as identified in the tables above.

Efficient hospitals in this study fall into Zone 3 of the Pabon Lasso graph. These institutions can reach an ideal level of performance through appropriate service management and conforming to the current admission and hospital stay standards. However, hospitals that fell into Zone 4 with high average long stay ratio and low (BTO). A situation that felt to be due mainly to the nature of the diseases treated in these centers. Broad strategies for enhancing the performance of Zone 4 hospitals include a shift towards outpatient services and efforts to overcome shortages and improve management. Nevertheless, hospitals that fell into Zone 1 indicate poor performance and inefficient usage of resources. One short-term strategy to address this problem could include a halt to hospital expansion for the time being. At the same time, every effort should be made to identify and correct factors contributing to the present state of poor efficiency. Finally, those hospitals that fall in Zone 2 are characterized by excess bed supply, unnecessary bed supply and the use of beds for patient observation.

CONCLUSION

Since the public sector in Jordan is the main institutional provider of primary and hospital care in Jordan, this study uses two models to measure the relative efficiency and performance of public hospitals in Jordan for the period (2006-2008). These are a non-parametric mathematical programming model (DEA) and a technique that interprets hospital efficiency using graphical analysis that allows an easier combination of hospital efficiency indicators for meaningful comment on the efficiency (Pabon-Lasso Diagram). The results indicate that the average efficiency of public hospitals in Jordan during the period (2006–2008) is varied and ranges between (73%) to (100%). The average of the relative efficiency of the sample hospitals over the study period is 94%. Of 15 hospitals, the number of efficient hospitals increased from 7 in 2006 to 9 in 2007, but decreased to 8 in 2008.

The results are compared with Al-Shammari (1999), who measured the same 15 sample hospitals. This comparison leads to signify that the efficiency of public sector hospitals in Jordan is varied over time, due to decreasing public expenditures on health care per capita, in real not nominal values.

On the other hand, the analysis shows that large hospitals strongly outperform small and medium ones in terms of efficiency. This might lead to conclude that hospital size is a determinant of efficiency. However, the results concerning ratio analysis in explaining efficiency implies that efficient hospitals fall into Zone 3 of the Pabon Lasso graph. Inefficient hospitals fell into Zone 1, 2 and 4. This inconsistency implies that these institutions are either having poor management or they treat long stays diseases. Efficiency scores show how close hospitals to using their maximum performance capacity. Thus, it is

recommended that inefficient public hospitals need to improve their efficiency and performance, by either (1) appropriate service management, (2) conforming to the current admission and hospital stay standards, (3) shift towards outpatient services, and/or (4) encourage resources employment efficiency by better handling expenses. It is recommended to use DEA technique in assessing and measuring performance of hospitals because it can be used regardless of their types and seeks to address the limitations of other models. However, more research employing advanced DEA modeling should be devoted to analyze the impact of other regulatory-specific and hospital-specific variables on efficiency such as quality of health care services.

He can be reached at ajlouni4@yahoo.co.uk. Amr Zyoud and Bashar Jaber are nurses with a master degree in health care services management from Yarmouk University. Haya Shaheen is a dentist with a master degree in health care services management from Yarmouk University. Malik Al-Natour and Rami J. Anshasi are pharmacists with a master degree in health care services management from Yarmouk University.

ADDING FLEXIBILITY FOR NPV METHOD IN CAPITAL BUDGETING

Jeng-Hong Chen, Albany State University

ABSTRACT

Various survey studies document that net present value (NPV) method is very popular and widely used by firms in capital budgeting in practice. The main disadvantage of NPV approach is that it lacks of flexibility and the firm needs to make the decision today in spite of uncertain factors the project faces in the future. The way to address such deficiency is to incorporate real options tool to supplement NPV criterion. Although survey literatures indicate that firms seldom use real options method in capital budgeting due to lack of knowledge/skill and lack of support of top executives, we can foresee that using real options technique to supplement NPV method in capital budgeting will be the future trend. In finance education, to assist future executives be on the right track for the future trend, real options approach, along with other advanced techniques such as simulation and binominal lattices should be taught and emphasized in MBA-level (or advanced undergraduate-level) corporate finance courses.

JEL CLASSIFICATION: G31

KEYWORDS: Capital Budgeting, NPV, Real Options

INTRODUCTION

Capital budgeting, the process of evaluating projects to make investment decision, is an important topic in corporate finance. There are many approaches a firm can utilize to evaluate projects in capital budgeting. Payback (PB), discounted payback (DPB), net present value (NPV), internal rate of return (IRR), modified internal rate of return (MIRR), average accounting return (AAR), and profitability index (PI) are the techniques usually seen in corporate finance textbooks. Each method has its advantages and disadvantages. Traditionally, NPV method, which accounts for time value of money (TVM) and shows the value added to the firm, is considered better than other methods and can be used as the primary decision criterion. In practice of capital budgeting, several studies have documented their findings, summarized on Table 1, from surveying firms' chief financial officers (CFOs) in different countries.

Graham and Harvey (2001) survey 392 CFOs of US firms regarding the practice of corporate finance issues such as cost of capital, capital budgeting, and capital structure. Their survey results show that IRR approach is most frequently used in capital budgeting; 75.61% of respondents always or almost use IRR technique. A slightly lower percentage than IRR technique, NPV method is always or almost used by 74.93% of CFOs. In addition, the firm's size affects the approach utilized. IRR and NPV are relatively likely to be utilized by large companies, while payback period is relatively preferred by small companies. Ryan and Ryan (2002) receive 205 CFOs' responses from surveying Fortune 1000 firms about capital budgeting practice and find that the most preferred technique is NPV, followed by IRR and payback is ranked the third. In Europe, Brounen et al. (2004) sample 6,500 companies from UK (2,000 firms), Netherland (500 firms), Germany (2,000 firms), and France (2,000 firms) to analyze corporate finance practice in capital budgeting techniques, cost of capital estimates, capital structure, and corporate governance. 313 firms' CFOs respond and 68, 52, 132, and 61 firms are in UK, Netherlands, Germany, and France, respectively. The results indicate that most European companies choose payback period as their most popular capital budgeting method, followed by NPV and IRR approaches.

Besides US and Europe, Baker et al. (2011) survey CFOs of 214 Canadian firms to investigate what capital budgeting methods are used in their firms. Their results show that NPV, IRR, and payback are top three popular methods used in capital budgeting. 49.2%, 45.8%, and 38.8% of respondents always use NPV, IRR, and payback methods, respectively. In summary, the literatures show that NPV method is almost the most preferred method in US and Canada and the second-ranked popular method in Europe. Although NPV technique is widely used in corporations globally, the main disadvantage of NPV method is that it lacks of flexibility and the firm needs to make the decision today in spite of uncertain factors the project faces in the future. A good way to address the disadvantage of NPV approach is incorporate real options tool to supplement NPV criterion. Real options are options for investment of real assets, different from financial options. Real options in capital budgeting give the project manager flexibility to make the decision in the future based on the future economic conditions. The research of real options in academia is abundant; however, real options are not widely adopted by corporations in practice so far.

Graham and Harvey (2001) find that only 26.59% of firms incorporate real options of a project when evaluating it. Ryan and Ryan (2002) point out that as to advanced methods, sensitivity analysis is the most preferred criterion, followed by scenario analysis and real options are least adopted. Only 1.6% of respondents always or often use real options as the supplemental tool in capital budgeting. An encouraging finding from Brounen et al. (2004) is that there are a higher percentage of European firms which always or almost always incorporate the real options technique.

Block (2007) surveys top-ranking financial officers of Fortune 1,000 companies to know whether they use real options method to complement NPV criterion in decision making. For 279 respondents, 40 companies (14.3% of them) were using real options and 239 companies (85.7% of them) were not using real options techniques. For non-users of real options, the top one reason is lack of top management support. Further comments indicate that top managers of many companies hesitate to accept an approach they cannot follow step-by-step. The encouraging thing is that 43.5% of non-users of real options indicate that if there is a good opportunity to use real options approach, they will consider using it in the future. Baker et al. (2011) also survey CFOs of 214 Canadian companies to know how they think of real options technique in capital budgeting. However, real options method is least used; only 10.4% of surveyed firms always or often use real options and 80.9% of surveyed firms never used real options method in capital budgeting. For those firms who do not use real options in capital budgeting, the main reason is lack of expertise or knowledge. They also find that real options approach is less popular in the firms managed by chief executive officers (CEOs) with the MBA degrees. This finding implies that CEOs with MBAs are less likely to support the approach they are not familiar with.

The survey results of Block (2007) and Baker et al. (2011) indicate that firms seldom use real options method in capital budgeting due to lack of knowledge/skill and lack of support of top executives. It is understandable that CEOs with MBA degrees prefer not to use real options because they hesitate to adopt the method they are not familiar with and cannot oversee the process of capital budgeting. The issue is why top executives with MBAs do not have enough knowledge or expertise of real options approach. The possible explanation is that this method was not taught or particularly emphasized when executives took corporate finance course(s) in their MBA programs. The real world's business is getting more and more complicate. Solely relying on NPV method may not able to make investment decision of good quality. We can foresee that using real options tool to supplement NPV method will be the future trend. In finance education, to help future executives be on the right track for the future trend, real options approach, along with other advanced techniques such as simulation and binominal lattices should be taught and emphasized in MBA-level (or advanced undergraduate-level) corporate finance courses.

Table 1: Literature on Surveying Capital Budgeting Methods Firms Use

Research	Country	# of Firms respond the survey	% of firms “always” or “almost always (or often)” use in capital budgeting			
			NPV	IRR	PB	RO
Graham & Harvey (2001)	US	392	74.93%	75.61%	56.74%	26.59%
Ryan & Ryan (2002)	US	205	85.1%	76.7%	52.6%	1.6%
Brounen, de Jong, & Koedijk (2004)	UK	68	46.97%	53.13%	69.23%	29.03%
	Netherlands	52	70.00%	56.00%	64.71%	34.69%
	Germany	132	47.58%	42.15%	50.00%	44.04%
	France	61	35.09%	44.07%	50.88%	53.06%
Baker, Dutta, & Saadi, (2011)	Canada	214	74.6%	68.3%	67.2%	10.4%

NPV: Net Present Value; IRR: Internal Rate of Return; PB: Payback; RO: Real Options

In the following part of this paper, an example of incorporating real options tool to supplement NPV approach is presented. Real options have values due to allowing for flexibility of timing of decision making. The value of a project will increase if real options are incorporated.

Example 1: Option To Abandon At Year 1 Assume that a project with a life of 5 years has the following cash flow stream.

Year	0	1	2	3	4	5
Cash Flow	-\$60,000	\$16,000	\$16,000	\$16,000	\$16,000	\$16,000

The initial outlay is -\$60,000 and the expected after-tax cash flow from year 1 to year 5 is \$16,000. The cost of capital is estimated to be 12%. Therefore, the net present value (NPV) is

$$NPV = -\$60,000 + \sum_{t=1}^5 \frac{\$16,000}{(1+12\%)^t} = -\$60,000 + \$57,676.42 = -\$2,323.58$$

Based on the traditional NPV method, the project would be rejected since its NPV is less than zero. If real options with flexibility are considered in this example, the decision may differ. For instance, the expected after-tax cash flow of \$16,000 for each year from year 1 to year 5 may imply that there is 50% chance that the after-tax cash flow could be \$12,800 for each year (20% lower than \$16,000) and there is another 50% chance that the after-tax cash flow could be \$19,200 for each year (20% higher than \$16,000). In addition, after receiving the first cash flow at the end of year 1, the firm has the option to give up the project at the end of year 1 and receive the after-tax salvage value of \$48,000. Thus, the cash flow stream for the option to abandon at year 1 can be presented as follows.

Year	0	1	2	3	4	5
Case I Cash Flow (50% Chance)	-\$60,000	\$12,800	\$12,800	\$12,800	\$12,800	\$12,800
Salvage Value at Year 1		\$48,000				
Case II Cash Flow (50% Chance)	-\$60,000	\$19,200	\$19,200	\$19,200	\$19,200	\$19,200
Salvage Value at Year 1		\$48,000				

Under such circumstance, the strategy to decide whether the project should be abandoned at the end of year 1 is that; if the present value at the end of year 1 (PV_1) of cash flows from year 2 to year 5 is less than the salvage value at the end of year 1, the project should be abandoned and the firm sells off the facility to receive the salvage value. Otherwise, the project should continue and not be abandoned.

First of all, for case I, the PV at the end of year 1 of cash flows from year 2 to year 5

$$PV_1 = \sum_{t=2}^5 \frac{\$12,800}{(1+12\%)^{t-1}} = \$38,878.07 \text{ is less than the salvage value at the end of year 1, } \$48,000.$$

Therefore, at the end of year 1, after receiving \$12,800, the firm should abandon the project and then receives the salvage value of \$48,000. So, the cash flow at the end of year 1 equals to \$12,800 + \$48,000 = \$60,800.

Second, for case II, the PV at the end of year 1 of cash flows from year 2 to year 5

$$PV_1 = \sum_{t=2}^5 \frac{\$19,200}{(1+12\%)^{t-1}} = \$58,317.11 \text{ is greater than the salvage value at the end of year 1, } \$48,000.$$

Therefore, the firm should continue the project.

Finally, combine case I and II, the project's expected (weighted average) NPV is computed as

$$NPV = -\$60,000 + 50\% \times \frac{\$60,800}{1+12\%} + 50\% \times \sum_{t=1}^5 \frac{\$19,200}{(1+12\%)^t} = \$1,748.71$$

The option to abandon increases the project's value so NPV becomes positive. After considering option to abandon at year 1, the firm can accept the project. The value of option to abandon is \$1,748.71 - (-\$2,323.58) = \$4,072.29.

Applying Black-Scholes Put Option Pricing Model: The question in the above example 1 can be regarded as that the firm owns a put option to sell the project's assets with current prices of \$33,944.31 (50% chance) and \$50,916.46 (50% chance) for the exercise price of \$48,000 one year from now. The current

price is computed as $S = \sum_{t=2}^5 CF_t \cdot e^{-0.12t}$. The firm can apply the following Black-Scholes (1973) put option formula to calculate the value of option to abandon at year 1.

$$P = Xe^{-rt} N(-d_2) - SN(-d_1) \quad (1)$$

where

$$d_1 = \frac{\ln(S/X) + (r + \sigma^2/2)t}{\sigma\sqrt{t}} \quad \text{and} \quad d_2 = d_1 - \sigma\sqrt{t}$$

P is the value of put option.

X is the exercise price.

S is the initial (current) price.

r is the risk-free rate. Assume $r = 4\%$.

σ is the standard deviation (volatility). Assume $\sigma = 10\%$.

t is the time to maturity.

N is the cumulative probability density function for the normal distribution.

Assume there is no dividend.

The values of the put option from equation (1) are \$12,174.78 (50% chance) and \$411.26 (50% chance). Thus, the expected value of option is \$6,293.02.

Example 2: Npv Simulation

Simulation analysis integrates sensitivity and scenarios analyses. Addressing the uncertainty, simulation tool allows for randomness of multiple input variables within defined distributions to calculate the probability distribution of the output. Ryan and Ryan (2002) find that 19.4% of responding firms always or often use real options as the supplemental tool in capital budgeting. With the availability of simulation software, simulation analysis will gradually be popular in the future. An example of using simulation to calculate the probability distribution of NPV is presented as follows.

A firm is considering a project with the following information.

- Project life: 5 years
- Capital expenditure at year 0 = \$40,000
- Selling price per unit = \$6
- Sales at year 1 = 5,000 units
- Sales growth rate for each year = 7%
- Fixed costs per year = \$9,000
- Variable costs per year = 45% of sales revenues per year
- Depreciation method: Declining balance depreciation (depreciation rate = 50%) for the first three years and then switch to straight-line depreciation for the remaining two years, depreciating to book value of zero at the end of year 5
- Tax rate = 40%
- No change in net working capital
- Salvage (market) value of facility at the end of year 5 = \$16,500
- Cost of capital = 11%

Based on the above information, the firm can calculate the projected operating cash flow for each year is calculated as follows.

Table 2: Projected Operating Cash Flow

Year	1	2	3	4	5
Price per unit	\$6	\$6	\$6	\$6	\$6
Unit sales*	5,000	5,350	5,725	6,125	6,554
Sales revenues*	\$30,000	\$32,100	\$34,347	\$36,751	\$39,324
Fixed costs	9,000	9,000	9,000	9,000	9,000
Variable costs*	13,500	14,445	15,456	16,538	17,696
Depreciation	20,000	10,000	5,000	2,500	2,500
EBIT*	\$(12,500)	\$(1,345)	\$4,891	\$8,713	\$10,128
Less: Taxes (40%)*	(5,000)	(538)	1,956	3,485	4,051
After-tax operating income*	\$(7,500)	\$(807)	\$2,935	\$5,228	\$6,077
Add: Depreciation	20,000	10,000	5,000	2,500	2,500
Operating cash flow*	\$12,500	\$9,193	\$7,935	\$7,728	\$8,577

*: The numbers shown in table 2 and table 3 from year 3 to year 5 are rounded to integers. Their actual values include decimals and are counted when doing calculation.

Table 3: Projected Total Cash Flow

Year	0	1	2	3	4	5
Operating cash flow*		\$12,500	\$9,193	\$7,935	\$7,728	\$8,577
Capital expenditure	\$(40,000)					\$9,900**
Total cash flow*	\$(40,000)	\$12,500	\$9,193	\$7,935	\$7,728	\$18,477

** : After-tax salvage = Salvage value – Tax on gain = \$16,500 – (\$16,500 – \$0)*40% = \$16,500*(1 – 40%) = \$9,900

$$NPV = -\$40,000 + \frac{\$12,500}{1+11\%} + \frac{\$9,193}{(1+11\%)^2} + \frac{\$7,935}{(1+11\%)^3} + \frac{\$7,728}{(1+11\%)^4} + \frac{\$18,477}{(1+11\%)^5} = \$579.90$$

Based on the traditional NPV approach, the firm should accept the project because of positive NPV, which adds more value to the firm and therefore increases the shareholders' wealth. However, the NPV method does not account for the dynamics of input variables. In reality, the input variables such as price per unit, sales growth rate, variable costs, and the salvage value may change each year. These four stochastic variables can be defined as follows:

1. Price per unit will fluctuate each year. Assume price per unit in year 1 is normally distributed with a mean of \$6 and standard deviation of \$1.8 (30% of \$6). Also assume price per unit after year 1 follows the random walk, which indicates that successive changes of price are random and serially uncorrelated. Thus, the best predictor of the future changes of price is zero and the best expected price for the next year is the current year's price.
2. Unit sales change each year. In year 1, they are assumed to be normally distributed with mean of 5,000 units and standard deviation of 1,000 units (20% of 5,000 units). Assume the annual growth rate of unit sales after year 1 follows the normal distribution with mean of 7% and standard deviation of 10%.
3. Variable costs account for 45% of sales revenues each year. Assume variable costs follow Project Evaluation and Review Techniques (PERT) distribution with minimum of 39%, maximum of 54%, and most likely of 45% of sales revenues
4. The salvage (market) value of the facility at the end of year 5 is expected to worth \$16,500. Assume it is normally distributed with mean of \$16,500 and standard deviation of \$3,300 (20% of \$16,500).

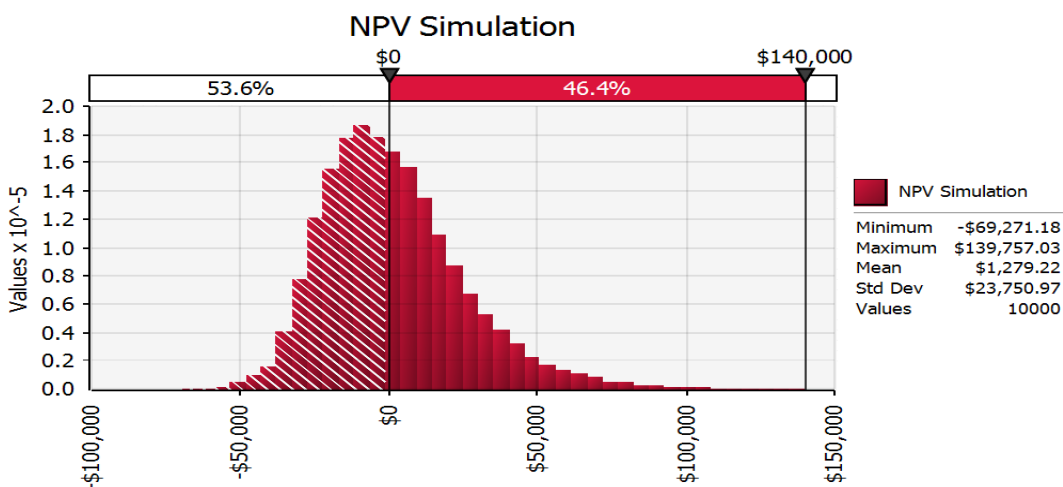

Based on the above stochastic variables, the simulation for NPV is conducted. After 10,000 iterations, the simulation result is shown on Figure 1 and Table 4.

Table 4: Basic Statistics of NPV Probability Distribution from Conducting Simulation

Minimum	Maximum	Mean	Median	Mode	Std Dev	Skewness	Kurtosis
-\$69,271.18	\$139,757.03	\$1,279.22	-\$1,829.00	-\$1,040.67	\$23,750.97	0.8653	4.4024

The probability of negative NPV is 53.6%, greater than the probability of positive NPV, 46.4%. Although the mean NPV is \$1,279.22, the NPV distribution is positively skewed (skewed to the right). The median and mode NPVs are all negative. So, the firm needs to be cautious before deciding whether to accept this project.

Figure 1: Result of NPV Simulation with 10,000 Iterations

CONCLUSION

Although the traditional NPV method has its advantages for accounting for time value of money and showing the project values added to the firm, it is not able to address the flexibility and uncertainty of capital budgeting in the business world. Practitioners can consider adopting real options technique to supplement NPV approach to improve the quality of decision in capital budgeting. The factors affecting business investment will be becoming more complicated. Although real options are not widely used by corporations currently in capital budgeting practice, it is predictable that using real options will be a trend in the future. In business schools, real options approach, along with other advanced methods such as simulation and binominal lattices should be taught in MBA-level (or advanced undergraduate-level) corporate finance courses. If future managers learn and practice these techniques in school, they will have better knowledge to utilize these methods to deal with the complexity of capital budgeting and make better decision for corporations.

INTEREST RATE RISK: SEVERAL STATISTICAL ANALYSES

Peter Harris, New York Institute of Technology
K. Kallianotis, New York Institute of Technology
K. Kasibhatla, New York Institute of Technology
John Malindretos, New York Institute of Technology

ABSTRACT

We introduce a macroeconomic system which we use for interest rate determination. Then we generate the interest rate risk premium. Considering this risk premium function, we investigate, test, and determine the macro-variables which affect the interest rate risk premia by using a GARCH (p,q) and an ARCH-M model. The empirical results examine ten different interest rate risk premia and fifteen factors. Factors with significant effects on risk premia are, the real risk-free rate of interest, the inflation rate, the unemployment rate, the growth of GDP and industrial production, the growth of national debt and current account deficit, the money supply growth, the yield differentials on S-T and L-T securities and other variables.

THE CASE FOR SOFT-SKILLS DEVELOPMENT IN MBA PROGRAMS

Nadia Shuayto, Lawrence Technological University

ABSTRACT

The objective of this research was to determine the skills business leaders find most critical in MBA programs to adequately prepare leaders and professionals for organizational success. A second goal was to explore the relationship between the perceptions of business and industry leaders and business school leaders on the rankings of skills deemed most important to prepare students for success in their business careers. The conceptual framework for this study was based on Tanyel's et al., 1999 study. A survey instrument was administered to 67 respondents from prospective employers of MBA graduates and 15 respondents among university deans and directors located in the state of Michigan. The two samples consisted of a matched pair design and rank order means for skill rating by the prospective employers and the matched mean rating from the deans/ directors. The major findings found significant differences in the mean rating of the importance of "soft skills" vs. "hard skills" among the prospective employers of MBA graduates. Additionally that there is a significant difference in the mean rating of the importance of "soft skills" vs. "hard skills" for MBA graduates among the deans and directors at universities with MBAs. This research offers business school leaders empirical evidence for curriculum redesign for prioritizing skills and designing coursework to incorporate top ranked skills viewed as most important by business and industry leaders.

KEYWORDS: MBA programs; Management skills; Soft skills; Hard skills

INTRODUCTION

Business degrees, considered prestigious in the early 1980s, declined in prestige beginning in the 1990s due to the lack of perceived effectiveness of MBA programs (Allen, 1998; Hahs, 1999; Oblinger, 1998; Storey, 1997). With the events that followed September 11, 2001 coupled with the U.S. recession of 2008, business degrees continue to face a downward spiral. Employers criticized business schools and business graduates as generally unable to transfer content knowledge to real situations in a fast-paced global work place (Ainsworth & Morley, 1995; Carter, Goodrum, Saito, & Naugle, 1999; Dudley, 1990; Fisher, 1994; Saito, 1994; and Voght & Schaub, 1992). Business educators appear to be equally disgruntled. In an archived article sourced from AACSB, Greenburm (2006) notes the criticisms of leading business educators:

It appears that industry and academia are in agreement that business programs require dramatic changes to the curriculum that is aligned with the needs of the new global workforce. The case for making business programs more desirable has never been so critical. And, business schools need to quickly get on board with deep changes to their curriculums to avoid further declines.

Research is needed to determine whether business schools are addressing the criticisms and preparing their students with the skills demanded by the corporations that hire their graduates. If business schools and corporations work together, their efforts could result in improved MBA programs.

LITERATURE REVIEW

Business is changing. As business changes, what it needs from employees will shift. Most of all, business needs people who will enter the workplace ready to make a solid contribution but who will also be effective in the future. Leaders will be required who can anticipate and lead change. Graduates of higher education will need to be flexible, adaptable, and in possession of a mix of broad education and specific skills. Communication, interpersonal skills, problem solving, decision-making, and teamwork are the competencies that will allow employees to grow and adapt as the world of work continues to change (Oblinger, 1998). While there are numerous explanations for the change in criteria for workplace skills, the impact of globalization appears to be one of the most significant causes that appear in many analyses (Rhinesmith, 1996; Williams, 1996). In response to increased global competition and the expansion of the world economy, businesses are seeking workers more highly skilled in the soft skills (Caudron, 1999; Solomon, 1999; Himmelsbach, 1999).

As global issues become ever more important, over the last few years the criticism has emerged that American MBA programs are not international enough, either in the number and variety of international business courses, or in the qualifications of those who teach them (Ball & McCulloch, 1993; Beamish & Calof, 1989; Muuka, Harrison, & Hassan, 1999). Streisand (1995) writes that America's colleges and universities are often accused of having little in common with the real world, and Eberhardt, Moser, & McGee (1997) state that recently many articles have appeared, noting "an apparent gap between the skills and abilities of business graduates and the needs of U.S. businesses." Tanyel and et. al. (1999) state that "the business environment changes faster than curricula at colleges and universities because of the cumbersome process often involved in curriculum revision, including political posturing by operating entities and conflicting educational philosophies among faculty."

According to Neelankavil, (1994):

Graduate business schools must take a careful look at their programs to prepare MBAs to face challenges of the changing business environment. Some specific criticisms of graduate business programs are: 1. Many MBA programs focus on technical skills to the exclusion of communication skills. 2. MBA programs do not teach their graduates leadership, creativity and entrepreneurship. 3. MBA programs ignore the importance of teamwork. 4. MBA programs lack integration and a global perspective. To raise the quality of MBAs, schools need to cover material relevant to client firms and incorporate new materials into existing courses that stress written and oral communication. Faculty and executives should forge links to evaluate graduates and update classroom material. Faculty should be encouraged to undertake business internships. Corporations must identify MBAs with potential for senior level management and train them, focusing on leadership negotiating skills and long-term planning.

Skills for The Organization – What Business Firms Require

Both academics and employers complain that college graduation requirements, based primarily on passing sets of courses, fail to ensure that the graduate has the personal qualities and skills needed to succeed in graduate school, professional training, or in the workplace (Oblinger, et. al. 1998). These skills include initiative, persistence, integrity, the ability to communicate effectively, to think creatively as well as critically, and to work with others to solve problems (Oblinger, et al. 1998). Also required are those skills involving interaction among people such as interpersonal skills, teamwork, and communication skills (Harvey et al. 1997).

“Many educators will claim that our colleges already provide just such preparation. But if we listen to those who employ our graduates or to educators in graduate and professional schools, we hear that an enormous chasm exists between what higher education claims it is doing and what is actually achieved” (Lavenberg 1997, A64). Many industries and large corporations are dismissing employees who hold MBAs or replacing them with technical people who do not necessarily have an MBA degree (Yucelt, 1998). Yucelt contends that part of the blame lies with business schools for choosing to teach what they want instead of what business firms need. Therefore, in the U.S., demand for the MBA is declining, and business schools are facing the toughest challenge regarding increased tuition, programs content, quality and teaching skill (Yucelt, 1998). According to Harvey & Knight (1996),

employers are not looking for trainees when they employ graduates but people equipped to learn and deal with change. Employers want graduates who are adaptable and flexible, who can communicate well and relate to a wide range of people, who are aware of, but not indoctrinated into, the world of work and the culture of organizations, and who, most importantly, have inquiring minds, are willing and quick to learn, are critical, can synthesize and are innovative.

Mardeusz (1995) suggests that over the last three decades little change has been made in university curricula with respect to advanced degrees in Business Administration. In 1986, the American Assembly of Collegiate Schools of Business (AACSB) reported that business schools fail to provide students with the tools and perspectives that are needed to build foundations for successful contributions as employees and leaders in business. Since that time, traditional MBA programs have been criticized for excessive focus on quantitative and technical skills and too little attention to such soft skills as interpersonal, communications, teamwork and people skills (Colvin, 1997; Eberhardt et al., 1997; Hahs, 1999; Nicastro and Jones, 1994; Nowak et al., 1996; Oblinger, 1998; O'Reilly, 1994; Pearce, 1999; Tanyel et al., 1999; Tomlinson, 1999; Wardrope & Bayless, 1999; Whettingsteel, 1999; Zolner, 1996).

Soft Skills

Contrary to popular belief, soft skills do make a difference in the business world (Workforce, 1999). Although managers still need typical techniques taught in MBA programs, they need additional tools to be effective. Today's managers need a variety of soft skills in communication, negotiation, and team building to effectively manage technological change and corporate stress resulting from downsizing and rapid growth (Deverell, 1994). According to a study of what corporations seek when they hire MBAs, the three most desired capabilities are communication skills, interpersonal skills and initiative—all of which are elements of emotional intelligence (Caudron, 1999). In a recent study of 1,400 CIOs in the United States, RHI Consulting Inc. found that twenty-seven percent of CIOs said interpersonal skills are the most important factor for reaching management levels in the IT field (Solomon, 1999).

In 1995, Daniel Goleman, a psychologist and former New York Times reporter, published the international best seller, *Emotional Intelligence: Why It Can Matter More Than IQ* (Bantam Books, 1995). In it, he brought together years of research to show that emotional intelligence—which can loosely be described as “a person's ability to manage his or herself and relate to other people”—matters twice as much as IQ or technical skills in job success (Caudron, 1999). In a follow up book: *Working with Emotional Intelligence* (Bantam Books, 1998), Goleman revealed data from studies in more than 500 organizations that proved factors such as self-confidence, self-awareness, self-control, commitment and integrity not only create more successful employees, but also more successful companies (Caudron, 1999). Caudron (1999) states that, “as a result of Goleman's research and all the publicity generated by his best sellers, employers do appear to be more willing to invest in soft-skills development, especially at the higher management levels.” A study of 1,171 U.S. Air Force recruiters showing that the best performing recruiters were those who scored high on assertiveness, empathy, interpersonal relations, problem solving

and optimism (Caudron, 1999). Mariotti, (1998) contends that MBA programs in the U.S. are the best in the world. Still, there is an aspect of business they teach poorly or not at all—‘soft management.’ Teaching the ‘hard’ stuff—technology, financial analysis, and workflow—is the easy part. These topics yield to logic and analysis. The ‘soft’ stuff is the hard part. The MBA programs should teach these concepts, but only the best ones are beginning to do so.

METHODOLOGY

Data Collection

The data was collected and analyzed to determine the relative importance of each of the skills/attributes to both the organizations and business schools. The skills tested for this study came out of Tanyel et al. (1988) study and was used with permission from the authors. The organizations identified for the employer survey through the Dun and Bradstreet database had a contact person within the organization. However, the cover letter included with the instrument was sent to the “Vice President of Human Resources.” A return, prepaid envelope was included with the cover letter and survey. A return rate of 10% was anticipated, since the interest in the subject was expected to be high among corporations contacted. For the university survey, the author contacted either the Director of the MBA program, an Associate Dean, or the Dean, and read the appropriate sections of the survey to the respondent. The goal of this study was to determine whether or not business leaders believe MBA programs adequately prepare students in business skills. A second goal was to explore the relationship between the perceptions of business managers and business school leaders on how well MBA programs prepare students in the skills that organizations seek.

Design

The research population for this study consisted of human resource managers from companies throughout the state of Michigan. The second population consisted of Deans or Associate Deans of MBA programs in Michigan business schools. The same survey instrument was used for both populations. However, certain sections of the survey were left out for the deans/directors since the questions did not apply to them. The survey consisted of 16 managerial skills/attributes that the respondents were asked to rate on a scale from 1 (less important) to 5 (very important). The author used a five point Likert-type questionnaire designed for organizations that hire MBA graduates. A total of 2,000 surveys were mailed out to employers and 21 universities with MBA programs were contacted by telephone. A total of 78 surveys were received. However, 67 surveys were used since the rest indicated that they do not hire students with MBAs. A total of 14 deans and associate deans responded to the telephone survey. This study had a response rate of 3.4% from the employers and a 75% response rate from the deans or associate deans of MBA programs. The reason for the low response rate from the employers was that many of the managers we contacted by telephone indicated that they did not hire MBA graduates. Therefore, the questionnaire did not apply to their firms. The data was manually entered into SPSS 9.0 for Windows for statistical analysis. The 16 items from the survey were originally used in the study by Porter & McCibbin (1988) and later used by other researchers such as Ferketich (1998); Tanyel et al. (1998); and Levenburg (1996). Subjects were asked to rate the 16 attributes/skills on a scale of 5 (very important) to 1 (less important) that they desire of their newly hired college graduates. They were also asked to circle yes or no if their graduates demonstrate these skills.

Construct Validity and Reliability

To determine the reliability and validity of the instrument, the researchers pretested the instrument with selected human resource professionals before mailing it to the selected groups for their study. As this questionnaire was successfully tested and utilized by Tanyel et al. (1998), it can be assumed to meet the

requirements for construct validity. Literature on business skills and MBA knowledge constituted the body of literature used in the development of the questionnaire for this study. Principal writers in these areas included: Ferketich (1998); Levenburg (1996); (Porter & McKibbin (1988); and Tanyel et al. (1998).

RESULTS AND DISCUSSIONS

Test of Hypothesis One

Hypothesis HO1 states that there is no significant difference in the mean rating of the importance of “soft skills” vs. “hard skills” among the prospective employers of MBA graduates. All respondents were asked to rate the importance of 16 different skills. Of the 78 employers surveyed, 11 indicated that they did not hire MBA graduates. Each of the remaining 67 respondents rated both the hard and soft skills, so the t-test for Paired Samples was appropriately used. With the mean rating for soft skills being 4.57 and the mean rating for hard skills being 3.93, the resulting p-value of .000 was less than the established significance level of .05. As a result, the null hypothesis is rejected and it can be concluded that there is a significant difference in the mean rating of the importance of “soft skills” vs. “hard skills” among the prospective employers of MBA graduates. The rankings on the critical managerial skills to the organization are displayed in Table 1.

Table1: Rank Ordered Means for Critical Managerial Skills to the Organization (ranked by human resource managers)

Rank Order	Variable	Mean	SD
1	SS Responsibility & Accountability	4.82	.46
2	SS Interpersonal Skills	4.71	.55
3 or 4	SS Oral Communication	4.67	.54
3 or 4	SS Teamwork	4.67	.56
5	SS Ethical Values	4.61	.68
6	SS Decision Making & Analytical Skills	4.60	.61
7	SS Creativity & Critical Thinking	4.45	.64
8	HS Written Communication	4.44	.79
9	HS Time Management	4.42	.72
10	HS Project Management	4.21	.88
11	SS Persuasiveness and Influence	3.98	.92
12	HS Presentation Skills	3.96	.89
13	HS Assimilate new Technologies	3.90	.83
14	HS Computer Problem Solving Experiences	3.83	.96
15	HS Computer/Word Processing Skills	3.70	.94
16	HS Global/International Business Skills	3.15	1.32

N=67 Note: SS indicates Soft Skill and HS indicates Hard Skill

Test of Hypothesis Two

Hypothesis HO2 states that there is no significant difference in the mean rating of the importance of “soft skills” vs. “hard skills” for MBA graduates among the deans and directors at universities with MBAs. Table 5 summarizes the results of the t-test for paired samples. With the mean rating for soft skills being 4.29 and the mean rating for hard skills being 3.96, the resulting p-value of .014 was less than the established significance level of .05. As a result, the null hypothesis is rejected and it can be concluded that there is a significant difference in the mean rating of the importance of “soft skills” vs. “hard skills” for MBA graduates among the deans and directors at universities with MBAs. The ranking of deans of MBA programs on the critical managerial skills to the organization are displayed in Table 2. The rank ordering, Means, and Standard Deviations of the hard and soft skills are displayed.

Table 2: Rank Ordered Means of the Critical Managerial Skills to the Organization (ranked by Deans of MBA Programs)

Rank Order	Variable	Mean	SD
1, 2 or 3	SS Oral Communication	4.67	.62
1, 2 or 3	HS Written Communication	4.67	.62
1,2, or 3	SS Responsibility & Accountability	4.67	.51
4 or 5	SS Interpersonal Skills	4.60	.63
4 or 5	SS Decision Making & Analytical Skills	4.60	.83
6	SS Teamwork	4.33	.62
7	SS Creativity and Critical Thinking Skills	4.27	.70
8	HS Presentation Skills	4.13	.83
9 or 10	HS Time Management	4.07	.80
9 or 10	SS Ethical Values	4.07	.70

12	HS Computer/Word Processing Skills	3.93	.88
13	HS Ability to Assimilate New Technologies	3.80	.86
14	HS Project Management	3.73	.88
15 or 16	SS Persuasion and Influence	3.33	.90
15 or 16	HS Global/International Business Skills	3.33	1.11

N=15 Note: SS indicates soft skill and HS indicates hard skill.

Test of Hypothesis Three

Hypothesis HO3 states that there is no significant difference in the mean rating of the importance of each skill for MBA graduates among the prospective employers vs. the university deans and directors. The 67 respondents from the prospective employers rated each of the soft and hard skills, as did the 15 respondents among the university deans and directors. The mean rating among the soft and hard skills for the two groups were compared. Utilizing the Levine test, there is support for equal variances. Hence, for the soft skills, the t-test for Independent Samples had a p-value of .015 when the Equality of Variances assumption was used; as a result, the null hypothesis is rejected and it can be concluded that there is a significant difference in the importance of soft skills as rated by the prospective employers of MBA graduates vs. the university deans and directors. For the hard skills, the t-test for Independent Samples had a p-value of .874 when the Equality of Variances assumption was used. As a result, the null hypothesis is not rejected and there is insufficient evidence to conclude a significant difference in the importance of hard skills as rated by the prospective employers of MBA graduates vs. the university deans and directors.

FINDINGS AND CONCLUSIONS

The questions investigated in this study included the following: (1) What are the most important managerial skills to the organization, as identified by business managers? (2) What are the most important managerial skills to the organization, as identified by MBA program deans/directors? And (3), Is there a difference between how business managers and MBA programs directors rate managerial skill?

According to the prospective employer respondents, the most important attributes to be possessed by graduates are (in order of importance) responsibility and accountability, interpersonal skills, oral communication, teamwork, ethical values, decision-making and analytical skills, and creativity and critical thinking. Those attributes believed to be less important included written communication, time and project management, persuasive ability, presentation skills, ability to assimilate new technologies, computer skills, and global awareness. According the university deans/directors of MBA programs, the most important attributes are (in order of importance) oral communication, written communication, interpersonal skills, decision making and analytical ability, responsibility and accountability, ability to work in teams, creativity and critical thinking skills. Deans/directors said that ethical values, computer skills, time and project management, persuasive ability and global awareness were less important attributes.

Implications for Business Education

The top seven skills desired by prospective employers (in order of importance) are responsibility and accountability, interpersonal skills, oral communication, teamwork, ethical values, decision-making and analytical skills, and creativity and critical thinking. The average mean for soft skills (SS) among the prospective employers was 4.50 (on a 5 point scale), indicating that human resource managers determine that these skills are highly essential to the organization. The soft skills were all ranked in the top half of the critical managerial skills list. The hard skills (HS), written communication, time management, project management, presentation skills, ability to assimilate new technologies, computer skills and global/international business skills were all ranked in the lower half of the list. The average Mean for hard skills (HS) among human resource managers was 3.95 (on a 5 point scale) indicating that prospective employers desire soft skills over hard skills. The skill/ability believed to be most important by Deans/Directors of MBA programs was oral communication. The skill/ability ranked lowest on the list of critical managerial skills among deans/directors was global/international business skills. This is consistent with the finding for prospective employers.

According to the Deans/Directors of MBA programs, the top seven critical skills/abilities to the organization are oral communication, written communication, interpersonal skills, decision-making, responsibility and accountability, ability to work in teams, and creativity and critical thinking skills. Six of the seven skills are soft skills. The average Mean of soft skills for Deans/Directors was 4.27 and the average Mean of hard skills 3.93. The results indicate that soft skills are rated higher than hard skills among Deans/Directors of MBA programs. Because the goal of graduate business schools should be to provide graduates with skills and attributes that prospective employers desire, these results should be beneficial to Deans/Directors of MBA programs for curriculum revision and other changes in management education. Business schools need to add a substantial focus on the soft skills. They need to continually reassess their goals and strategies and make the necessary changes in order to keep up with the rapidly changing needs of business organizations. They need to be teaching what needs to be taught according to the needs of prospective employers. Graduate business programs must also find methods of strengthening soft skills, or people skills, while continuing to prepare students in the hard skills.

Limitations

The biggest concern of this research is assessing the degree of measurement error present. The researcher considered the validity and reliability of the measure. The data collected for this study focused on management education in the United States only. Furthermore, due to the regional nature of the study, the researcher excludes respondents from other regional areas since the results of the study focus on one region of the United States rather than the entire nation. Due to limited time and resources, this study did not cover managerial skill preparation in undergraduate business education. Although businesses are interested in skill preparation at the undergraduate level, this study was limited to management education at the graduate level. However, these topic areas could be addressed in future research.

Future Research

One problem in identifying trends in the literature base is the lack of uniformity in the critical skill set or characteristics and attributes that lead to success in business. Various researchers appear to be using different terms in the identification or description of similar skills/attributes. For example, should decision making and analytical ability be one skill or should they be broken up into two separate skills? One could argue that analytical skills are hard skills while decision-making skills are soft skills. Another area for future research is to determine if the results would differ if the population of employers were categorized into two groups. One category would be for manufacturing firms while the other would be for service firms. It would be interesting to see if they would rank soft and hard skills any differently.

Are human resource managers the ultimate customers of MBA programs? Would the results have changed had front line managers been the sample for this study? While HR managers may preach the “soft skills” line, what do line managers want? Due to the limited resources of this study, the results were obtained from one state. It would be very useful if this type of research was conducted in other regions of the country, a nationwide basis, and/or an international sample. Finally, it would be interesting to do comparative studies of the perceptions of students and employers, students and faculty, and students and alumni.

CURRENT TRENDS IN WIRELESS TECHNOLOGY

Rell Snyder, National University

ABSTRACT

The advances in technology have significantly revolutionized the way of our society. Many kinds' types of technologies are being used in every part of today modern business operations. One of the most innovated technologies is communication. Among communication technologies, wireless technology is one of the fastest growing technologies that are being implemented by various industries. Wireless technology has become the path to advance forward into the future. The markets of wireless technology will continue to grow, and societies will continue to change to adapt this new technology. This paper is an update on trends in wireless technology originally written by (Snyder and Sitthinart (2008).

INTRODUCTION

Cellular Phone

When discussing wireless technology, the first thing most people would think of is the cellular phone. Cellular phone, the symbol of wireless technology, is without doubt the most popular wireless communication device. It was first announced and introduced in eighties. When it first came out to public, it was considered to be a gadget for super rich, because "the price was some \$3,995 in 1983 dollars" (RetroVrick, n.d., ¶ 3). The fee of using the service was around ten to twenty dollars a minute in today's money. Besides it had about only thirty minutes of talking time before battery dies, it had a very little memory to store only a few numbers. Its high price made it far beyond the reach of average people. Today the price of cellular phone has become dramatically lower; it is widely available and affordable to anybody. The price has gotten low enough, companies can offer free phone with a contract of service. Not only the price but the features of cellular phones have evolved. Despite of 3G network becoming available to us; it is no longer the technology of future.

The future is newer generation of cellular network, which is 4G. On top of political issues they need to resolve when they are going to set new communication standards for whole country, they would need to figure out the way to resolve battery limitation. It would require lots of power in order transmit data at the speed comparable to DSL and cable modem. Current battery technology will not last long enough for hours of talk time or internet connection at that speed. "The battery issue is going to be vital for the successful implementation of 4G." (Digital Trends, 2005b, ¶ 4). Wireless security has been a significant issue with organizations and individuals. The Air Force has chosen General Dynamics smartphone for secret wireless communications. The Sectera Edge SME-PED is certified by the National Security Agency for sending and receiving classified voice and data through classified commercial WiFi and cellular networks Military and Aerospace Electronics (2011).

IMPACTS OF WIRELESS TECHNOLOGY

Wireless technology provides us some of the ground-breaking methods of communication. It enables us, governments, businesses, and consumers, to have instant unlimited access to any information, and communicate with anyone regardless of physical location. During the time of when wireless technology was not available, completion of any kinds of transactions and processes were very time consuming. This technology has become necessity of our daily lives. Our continue growth of demand for innovation continues to bring new innovation to wireless market.

A concern for organizations that are making investments in technology is determining and understanding the value of these technologies. Failure to address these issues can result in wasted time and resources and ultimately failure to realize their ultimate potential and return on investment. Inappropriate information technology investments can have a significant adverse effect on an organization, yet these decisions must be made. “Senior managers must understand the nature of technological change and be able to accurately interpret the IT landscape...” (Adomavicius, Bockstedt, Gupta and Kauffman (2008).

Education: In almost any kind of organization in our modern societies, wireless technology is being used constantly. Many of today’s schools have implemented and planning to implement the use of wireless technology into schools. Students who are growing up in today’s modern generation are different from generation grew up without internet. There are many students use wireless internet connection with their cell phones or tablets for their school work or education programs. Growing number of students, especially in college, are educating themselves outside of the classroom from online resources, or taking online classes. Wireless technologies are becoming a necessity for school and education.

News and media: News and media are effectively using, and have been greatly and positively impacted by wireless technology. It gives media the ability to transmit videos and report information virtually and instantly to any location. This enables them to immediately cover and broadcast their reports worldwide on important news, such as severe weather, war, and political issues. In the recent second Gulf War, many news stations used satellite to transmit and receive videos to report in real-time. These capabilities provide media new levels of reporting from anywhere in the world.

Medical Industry: Medical industry has also been impact by wireless technology, which is being used by doctors to help treat patients. Sharing and exchanging of medical information is highly expected in growing innovations of wireless technology. Doctors have been seeking and continue to seek new technologies to enable them to track progress of patients with ability to compare and exchange the information for entire medical industry. Medical industry may in the future place wireless device inside of patients in order to track heart rate, breathing status, or any other data that can help treat patients. Medical industry is constantly looking for the ways to advance the use of wireless technology as part of developing new medical devices. It expands possibilities of treatments, help saving lives, and extend life expectancy of future generation.

In-Body Implantation: In science fiction films or animation, it is common to see some characters being able to communicate to others without operating any device. The idea of it is implanting some sort of communication device right into the head. It probably sounds quite absurd to most people, but implant device into body is more common than you probably think. In fact, it is a direction of many companies are heading. Somewhat similar to medical technology described above, there is in-body wireless communication chip under research. This chip could be used for doctor to monitor patient’s pacemaker from anywhere (primdi.com, 2005). It could be used for many other applications... such as in implanted blood glucose meters, which control insulin for diabetics (Primdi.com, 2005, ¶ 1). Since this is a communication system that intends to be implanted into the body, it does not have power to transmit data for long distance. It is estimated that such in-body communication device has a range of no more than 3 meters or nearly 10 feet. Therefore, it would require a base station to transmit or receive data from hospital. The base station will be utilizing radio frequency technology to constantly establishing two-way communication. Size of base station may be small enough and work under battery, so patient may be able to go outside and still being under the watch of doctor.

The in-body communication devices are about to come true. We may not be very far away from implanting communication device into our heads. When it happens, it could revolutionize the cellular phone industry. Once medical technology became advanced enough to implant communication device

into the head as safely as laser eye surgery, cellular phone companies would most likely jump into offering such service.

Financial Market: Financial markets have been changed by wireless technology in many aspects, especially a communication between or within financial firms. The greatest impact of wireless technology to financial markets has to be the ability of transferring money in the way was previously impossible. The financial departments of companies all over U.S. and world are now able to conduct instant transactions. Portable device such as cell phone, tablet and laptop with wireless internet access enable people to transfer or wire money, trade stocks, and such on the move. Advanced wireless technology makes smaller financial companies more competitive, by offering unique services with mobile solutions, against major companies. TechRepublic (n.d.) states: A major issue for those operating in the finance sector is the reliability of both data and data delivery. Stock traders need to have instant access to changing prices so that they can make quick decisions on buying, or selling, stocks and shares (§ 1).

E-Book

E-book is a new way of how books are to be offered to readers, and how most readers in near future will read the books. Authors and publishers, by utilizing wireless technology's capability, can release books to portable device such as a smart phone or tablet, instead of a laptop or desktop to maintain the same portability of paper book. E-book provides many advantages over the tbook. "eBooks are completely interactive with the internet and can contain live links, graphics, forms, video and more. Your eBook can have a built in search engine so your readers can find exactly what they are looking for" (ItsOnlineNow, 2004, § 2). From financial point of view, the traditional it will also largely save the costs. Since the contents are all in digital, there will not be the costs of printing, delivery, and supply chain related.

Advertising: Advertising industries may the one that benefit from wireless technology the most. They always have been the one to take advantage of every information technology to effectively reach consumers. CNN (2000) states: The receptivity of users to wireless ads is a subject of intense interest to the companies that would be potential advertisers, said Alan Reiter, an analyst at Wireless Internet & Mobile Computing in Chevy Chase, Md. "Advertising for wireless is a hot topic this year," he said. "Corporations will drool over advertising to wireless devices" (§ 11).

Certainly advertisers are taking full advantage of wireless technology. It is noticeable in most wireless services. When users connect to internet with their phone, one third of the first default page always contain ads. Historically, users were charged based on how much data they have downloaded. Ads appear on default web site are mostly graphics which is going to cost money to users to view ads. There might be ethical issues of forcing their customers to pay for viewing ads.

Law Enforcement: In interest of protecting civilians, law enforcement is seeking support from wireless technologies. Similar to technologies such as surveillance system with facial recognition, criminal tracking, and criminal or terrorist database, help law enforcements, wireless technology provide stronger strengths and tactics to fight crime. To describe how wireless technology to be used, Govexe.com (2005) explains: ...the government's effort to create a national, interoperable wireless communications network for federal, state and local law enforcement agencies sounds like a no-brainer. The departments of Justice, Homeland Security and Treasury have joined forces through a joint program office to develop and deploy the Integrated Wireless Network, which will help them coordinate operations during law enforcement, homeland defense and disaster response missions (§ 1).

Military: Wireless technology is very useful and influences military warfare. Reliable communication during the battle is critical. It can be assumed that majority of most advanced wireless technologies are

implemented into many countries' military capabilities to stay ahead of potential enemies to defend homelands. Countries with advanced technological capabilities like Japan, U.S., and E.U. already have GPS linked navigation device for ground forces. Soldiers can sneak into enemy territory to find targets, then wirelessly transmit precise targeting data for air or artillery strikes. With better communication proved to help reduce casualty rate of our militaries.

Automotive Industry: For the last decade the automotive industry found ways of incorporating wireless technology into the vehicles. GPS navigation system is now standard on most luxury level cars. Navigation system receives wireless signal from at least three global position satellites from space to determine and calculate exact location of car. Drivers can now go to any unfamiliar places without getting lost or asking for direction. Many modern cars are now equipped with Bluetooth. It links with Bluetooth enabled cell phone for hands-free talking while driving. The newer feature currently available allows for traffic jam notification. It uses cellular network to obtain latest traffic information. Navigation system will recalculate to find possible and efficient routes to avoid traffic, and then verbally instructs the driver to take new routes. More advanced features is on the way to our future cars. CNNMoney.com (2006) explains: The age of Vehicle Infrastructure Integration -- known as VII and defined simply as cars that "talk" to each other and to roadside units via cellular, Wi-Fi, satellite and other technology -- is an evolutionary step comparable to the creation of the interstate highway system 50 years ago, say experts. "The auto will inevitably become an integral component of the wireless ecosystem," says Steve Underwood, a researcher at the Ann Arbor, Mich.-based Center for Automotive Research, or CAR (¶ 2).

...Proponents of VII say once wireless technology becomes commonplace we'll see things like seat belts communicating with roadside traffic managers, engineers and others to make driving safer, more efficient, and more enjoyable (¶ 3). Besides of offering more safety and convenience to drivers, wireless technology can also keep both passengers and drivers entertained on the road. This revolutionizes automotive industries in in-vehicle entertainment. Today, it is common to see DVD player in cars for rear-seat entertainment. In tomorrow's car, it will be a trend to have in-vehicle systems that allow drivers or passengers to wirelessly transfer, probably by Wi-Fi, video and music files from home to car (IT Professionals, 2005).

Video Game Industry: Wireless technology has innovated video game systems for our entertainment. Implementation of wireless technology is most noticeable in next general generation video game consoles released recently, such as PlayStation 3, Xbox 360, Wii, and PlayStation Portable (PSP). PlayStation 3, Xbox 360, and Wii are using wireless controllers. PlayStation 3 uses Bluetooth and Xbox 360 uses radio frequency to link controllers with the consoles. PSP has Wi-Fi capability to wirelessly buy and download new games. Among the next generation game consoles, Wii is definitely the most innovated one. Players need to move their arms to play the games. Inside of wireless controller, it has motion sensors. Wii uses Bluetooth to transmit motion data to the console. Wireless technology has changed the way we play games. The next level of playing game wirelessly is maybe to control by brain just like science fiction films. There is a scientist that has been developing a wireless headset which detects player's brain wave. "The player's brain is 'tuned in' by concentrating on flashing images, and then they can control the game" (BCC, 2004, ¶ 2). Researchers believe that this technology could be used for future game systems, and to operate computers for disabled people. Using brain wave may seem very innovative, however, since our brain is full of mystery, it may only raise more doubts and questions.

Sports: Wireless technology is being used in Soccer to determine the redirection of the ball. Alignment of various body parts and skill of the player all have effect on the ball's redirection. A study by Hanlon and Bir (2010) used wireless technology to simulate fifteen impact conditions commonly experienced in soccer play. They studied the effect on head injuries based on impact of the soccer ball and concluded that their system allow a comparison of different types of impacts during play.

Television: As a result a result of wireless technology, television has gone through many changes in a last decade. Thanks to satellite technology and cellular, this made it possible. Before satellite television service was available, we relied on cable network in order to watch television programming other than local channels. Cable companies' dominance caused the higher monthly price, and unsatisfactory services. When Satellite TV services become available, it became major competitors with cable companies. Satellite TV provides impressing range of programming, competitive prices, and availability to any part of country including any rural areas; forcing cable companies to improve their services. Ultimately, consumers gain great benefit from competition.

Today, we can enjoy television, with the use of such product as Sony Location Free, wirelessly in a lot more than two ways. It can wirelessly stream recorded or live programming, or any video sources to multiple destinations such as television sets, computers, and portable devices in other rooms. By taking advantage of wireless internet technology, you can even watch live or recorded programming from anywhere in the world. Fast innovations of twenty-first century make the entertainment from eighties and nineties seem like how anyone could enjoy back then.

Expectation

With fast innovations in hands free and handheld devices, talking on the cell phone becomes even more convenient. Cell phones now have accessibility to World Wide Web. Laptops have the capabilities of accessing internet without any wires or chords by Wi-Fi or cellular networks. The benefits of mobile data access and wireless connectivity are limitless. Although, there seems to be some limits in the companies who adopted wireless technology and mobilized their business processes and applications. Some companies fall behind the competitors because they failed to adopt new wireless technology. The reasons are decision makers are afraid to invest heavily into new technologies and of being forced to change their entire structure and strategies according to new technology.

Business

Roles of Wireless Technology: Wireless technology has played a major role in the growth and essential success of many markets. In addition to the wireless technology discussed previously, there are several methods of how wireless technology should be implemented into business procedures and routines. In order to meet expectation of overall productivity such as production, distribution, etc, implementation of new technology should cohere with customer demands and company standards. In some circumstances, it may be necessary to completely redesign to improve old systems.

Implementation and Benefits: By having up-to-date information and data readily available to every employee of all departments, it will help the companies keeping up with their industry in competitive manner. Such kinds of current information and data availability can be achieved with combination of corporate servers and users' portable devices with wireless connection capability.

Sales department employees can benefit from such capability, since they require rapid communication methods in order to meet customer satisfaction. This can be accomplished with the portable devices with wireless internet connection like Blackjack, or any other hand-held computing devices, laptops and tablets. A current challenge is it is essential to have wireless network that covers entire nation. Otherwise, wireless capabilities would not as effective as expected. It would not make sense for one company to spend hundreds of millions or even multi billion dollars to setup dedicated wireless network to cover entire nation. The financial friendly solution to this is to share network. Just like cellular phone companies came to agreement to share their cellular network so customers can make phone calls nationwide to anybody with different services, companies can share their private and public wireless network connections. They can agree on contract for sharing small percentage of certain profits. Negotiation of

this type of contract can be very time consuming and expensive initially. But these hassles will pay off when companies gain advantage in massive productivity increase and sales department gain benefits in providing superior services to their clients and customers.

Receiving and Sending Parcels: There are many benefits of wireless technology; some can be beneficial to parcel services in companies. FedEx and UPS are fully utilizing numerous wireless technologies to provide better services. It may be beneficial for non-delivery companies to utilize wireless technology on high value parcels they need to send. One of new technology UPS plans to incorporate in near future is Radio Frequency Identification (RFID). It enables to track parcels and determine current location in real-time (Susevi, 2007). Whenever companies need to send parcels worth millions of dollars, they can insert RFID to monitor progress of every moment to make sure it is being delivered safely on time.

Changing Communication: As a result of advancement in wireless technology, the standards of communication will increase in the near future. It has become a standard to make phone calls with wireless VoIP or some other sort of unified communication method. It will be expected to be always connected and reachable no matter where you are in the world. To avoid risks losing current positions and competitiveness; most companies need to constantly upgrade their information technology. It is a common corporate culture to be afraid of making changes. Executives or decision makers usually refuse to accept anything that affects them. In order to have smooth upgrade and changes, it is important to make constant changes into part of culture. The resurgence in WiFi has been in large part due to the inability of the cellular network to keep up with its demand (Sheffres, 2011). Wi-Fi hotspots are now widely available at many locations. Companies that already use wireless technology must have Wi-Fi multiple access point at every certain distance and floor

CONCLUSIONS

If trends continue, wireless technology will be the major method of communication. After considering how fast technologies have evolved, it will not be a surprise to see the technologies in today's science fiction films actually come true. All companies should be open-minded to everything that they are going to see in the future. Refuse to do so; they may fall victim to other companies that have embraced current wireless technologies.

STOCK MARKET AND TAXATION REVENUE: AN EMPIRICAL ANALYSIS

Roshaiza Taha, Universiti Malaysia Terengganu

ABSTRACT

This study empirically examined the relationship between stock market and taxation in Malaysia over the period of 1980 to 2008. By using the Gregory Hansen methodology this study examined which tax collected by Malaysia government have most impacted from the stock market performance in Malaysia. Our results show that stock market performance did contribute most to the changes in company tax revenue as compared to personal tax and real property gain tax. In addition this study also detects the significance break which impacts the nature of relationship between variable. This finding indicates that the performance of stock market in Malaysia has influenced by the strong growth of company tax revenue collection in Malaysia. Thus fiscal policy authorities in Malaysia should enhance the effort to promote stock market activities which later will increase the tax revenue collection; the major source of the country's development.

JEL: F3; G1; H2; O2

KEYWORDS: Company tax, personal tax, stock market, structural break

INTRODUCTION

Taxes have an important part to play in any government's economic and social policy. Tax policies normally contribute to the overall economic development specifically in Malaysia in two major ways i) ensuring stable growth in revenue to finance the annual budget; and ii) providing incentives within the tax system to promote growth, especially in private sector (Singh, 2005). Thus taxation in term of policies is well known able to promote economic activities such as investment, manufacturing, tourism and agriculture by offering incentives which in return contributing towards a more balanced growth. However since there are various taxes imposed on economic activities not all tax having the same economic effect. For instance by using vector autoregressive approach (VAR) Arin et al. (2009) found that different tax policy changes produce different financial response in G3 countries. Their results show that indirect tax has a larger effect on market returns than labor taxes. In addition company tax has no significant effect on stock return due to the ability of firm's to switch between equity financing and bond financing.

In addition many past research also have recognized the relationship between financial activities and fiscal policy. Darrat (1988, 1990) support the existence of the nexus between fiscal policy and stock market returns. However Akitoby and Stratmann (2008) by utilizing a panel data of emerging economies, suggest that the nature of the relationship between fiscal policies and economic activities depends on the interaction with the political institutions. They emphasize that taxation policies or approach which ease the tax burden on investment become the preference for international investors. Ardagna (2009) utilises the panel data for OECD countries from 1960 to 2002 and suggests that fiscal contractions do positively affect, and fiscal expansions do negatively affect, the performance of the stock market. Likewise, Laopodis (2009) reports that fiscal policy can affect the stock market in a negative and significant manner. Overall, the findings that fiscal policy inversely affects the performance of the financial market are supported either for an individual country or in a panel analysis.

Past studies document the relationship between fiscal policy and financial markets. However, none of these studies focused on the impact of financial market activities on generating tax revenue which is

important in analyzing the economic performance of the country. Boyd (2009) discuss the situation when the state runs out of money which affects the budget allocation. He emphasized the significant impact of recession (specifically on downturn in an investment on investment) on tax revenue collection. Therefore as fiscal policy has pivotal role in influencing the investment performance, likewise the role of investment in determining the trend of revenue collection. Realising this, Taha et al. (2010) analyzing the role of financial market on generating tax revenue in Malaysia. Results shows that while direct tax revenue have significant effect on stock market and bond market activities, both financial market instruments also play pivotal role in determining the revenue collection. However in this study the relation has been analyse at an aggregate level, and there is no identification on which particular tax instruments are most impacted from financial market activities. Therefore, the actual causal effect of financial market activities on specific tax revenue is largely unresolved. In addition this study also did not consider the potential break occurs which might change the nature of relationship exists between variables.

Therefore the purpose of this paper is to examine the relationship between stock market and tax return in Malaysia by focusing on personal tax and company tax revenue considering the pivotal role of such revenue on Malaysia economy. In addition this issue is of interest due to recent gyrations of the stock market due to global economic imbalance. Plummeting stock prices can cast a dark cloud over the financial position of all parties to include individual, companies and government. However there is lack of discussions devoted on the effect of increasing stock market activities on the tax revenue collection. Most of the studies focused on analyzing the nexus between tax and stock market aim at analyzing the effect of changes in tax burden on stock market activities. Further previous studies also aim to investigate the impact of tax on investment activities while neglecting other important component of financial system. The contribution of this study is two-fold. First these paper the impact of stock market on both personal tax and company tax in Malaysia. Second the recent analyses were utilized which cater the existence of break which take into consideration the entire economic event which occurs during the study period. The results suggest that stock market contribute to the strong growth in company tax revenue collection. However there is no significant impact of stock market on personal tax revenue.

METHODOLOGY, DATA AND EMPIRICAL RESULTS

Unit root tests: This study utilises data of company tax (total company tax revenue collection), personal tax (total personal tax revenue collection) and stock market (Kuala Lumpur Composite Index) in Malaysia using monthly data from 1980 to 2008. Tax revenues variables has been provided by Inland Revenue Board (Malaysia) while stock market data are extracted from DataStream and converted into natural logs. The analysis begin by examine the order of integration of variables to identify the time series characteristics of the data set. For this purpose this study used the augmented Dickey and Fuller (1981) test (ADF) and Kwiatkowski, Phillips, Schmidt, and Shin (1992) test (KPSS) to determine whether series or residuals of the regressions are stationary. In determining the optimal lag structure in ADF and KPSS testing procedure this study rely on the model selection criterions of Akaike Information Criterion (AIC) and Newey-West Bandwidth respectively. The results of ADF and KPSS unit root test are reported in Table 1. The null hypothesis tested is that the variable under investigation has a unit root against the stationary alternative. Based on the unit root result, the null hypothesis that each variable is integrated of order one $I(1)$ except for personal tax revenue is maintained.

Table 1: Stationary tests

Variables	ADF Test		KPSS Test	
	Level	1 st Differences	Level	1 st Differences
Company tax	-2.41	-6.54 ^{***}	0.15	0.08 ^{***}
Personal tax	-2.43	-10.91 ^{***}	0.30	0.31
Stock market	-2.88	-5.76 ^{***}	0.18	0.06 ^{***}

Note: Asterisks (*) and (***) denote statistically significant at 1% and 5% significance levels, respectively.

However in his seminal paper, Perron (1989) argue that failing to account for at least one structural break may lead the researcher not to reject the null hypothesis of unit root when in fact the series are stationary around a onetime structural break. Thus since the conventional approach of unit root test (ADF and KPSS) used above favor the null of unit root when a structural break exists, Zivot and Andrews (1992) unit root test (ZA test) were also employed. This test is used to determine whether any possible break point in the series changes the stationary results or not. In this paper the models of ZA are estimated over the period from 1980 to 2008. The results of unit root test together with the break-date for each series are presented in Table 2. These results suggest that the null of unit root for company tax and personal tax at 1% significance level can be rejected, while the result fails to reject the unit root hypothesis for stock market. This result clearly contradicts the results obtained from the unit root test without structural break for these series. The result shows that the year 1992 emerges as the most significant break-year for company tax. This can be associated with the introduction of tax incentives for research and development activities as well as the improvement of Bursa Malaysia trading for that particular year.

With the introduction of such incentives it can help to woo the investors since the investment in these activities received incentives which can reduce the burden in term of paying tax. In addition the improvement of Bursa Malaysia system also increase the company tax revenue collection as the investor are more confident to make the investment. The break year for personal tax in 2002 are resulted from the introduction of self assessment system (SAS) in 2001 for personal tax payer. With the introduction of SAS the burden of assessing tax liability has been shifted from the shoulders of tax assessors to the taxpayers. Thus the taxpayers are more aware to comply with the tax system to avoid the penalty imposed.

Table 2: Results of Zivot and Andrews one-break test

Variables	K	t-statistic	Break year
Company tax	4	-12.68 ^{***}	1992 M01
Personal tax	4	-9.65 ^{***}	2002 M01
Stock market	4	-3.91	1997 M08

Note: Asterisks (*) and (**) denote statistically significant at 1% and 5% significance levels, respectively.

Cointegration tests: After determining the integration level of variables, the Gregory and Hansen (1996) (GH tests) were employ in the presence of structural break. We use GH test instead of the conventional approach since the conventional approach assume that the cointegration relation is constant during the period of study. However in the case of sample period is long with few economic events took place, the results from conventional cointegration can be misleading as such approach neglected the potential break which may exists during the period of study. The GH test has a null hypothesis of no cointegration and its alternative hypothesis suggests cointegration with one structural break. The cointegration between variables exists when if the null hypothesis is rejected by the GH test. In this test three models are created as follows:

$$\text{Level shift: } y_t = \delta_0 + \delta_1(\phi_t) + \alpha(x_t) + v_t$$

$$\text{Level Shift with trend: } y_t = \delta_0 + \delta_1(\phi_t) + \beta(t) + \alpha(x_t) + w_t$$

$$\text{Regime Shift: } y_t = \delta_0 + \delta_1(\phi_t) + \alpha_1(x_t) + \alpha_2(x_t\phi_t) + z_t$$

where the structural shift in each equation is shown by a dummy variable ϕ and define as:

$$\phi_t = \begin{cases} 1: \dots \text{if } t > \tau \\ 0: \dots \text{otherwise} \end{cases}$$

with τ denoting the point in the sample at which a break occurs. For identifying this specific break the Quandt Andrew Breakpoint Test were employed. As reported in Table 3 the breakpoint identified is for 1997M08 for both relationships between company tax – stock market and personal tax – stock market respectively. This breakpoint is consistent with the 1997 Asian Financial Crisis that impacted the whole Asia.

Table 3: Quandt Andrew Breakpoint Test

	CT – SM	IT – SM
DATE	1997M08	1997M08

Based on the breakpoint identified from Quandt Andrew Breakpoint test, the GH test then conducted for both relationship. The results are as reported in Table 4. The results suggests that company tax and stock market are cointegrated in the presence of structural break in the data. In other words the results suggest a long-run equilibrium relation. However our results failed to identify any relationship between personal tax revenue and stock market.

Table 4: Gregory Hansen Results

	ct - sm	it - sm
	constant	constant
gh1	-4.94**	-3.26
gh2	-3.05	-3.56
gh3	-5.00**	-3.26
	constant + trend	constant + trend
gh1	-4.97**	-3.28
gh2	-3.05	-3.56
gh3	-5.04**	-3.27
	none	none
gh1	-4.94**	-3.26
gh2	-3.06	-3.56
gh3	-5.00**	-3.26

Note:

1. Asterisks (*) and (**) denote statistically significant at 1% and 5% significance levels, respectively.
2. Gregory Hansen Models: [GH1: break for the model with an intercept], [GH2: break for the model with a trend] and [GH3: break for the model with regime shift].
3. The critical values are taken from Gregory and Hansen (1996). The critical values for 1%, 5% and 10%: GH1: -5.13, -4.61, and -4.34; GH2: -5.45, -4.99, and -4.72; and GH3: -5.47, -4.95 and -4.68, respectively.

CONCLUSION

This paper uses monthly data to determine endogenously the most important years when structural breaks occurred and simultaneously test for the unit root hypothesis in the presence of these breaks in company tax revenue, personal tax revenue and stock market in Malaysia. To show the different between conventional approach which according to Perron (1989) normally neglected the existence of the potential break, ADF and KPSS unit root test were utilise where the results shows that the series contain unit root at first difference. Further this study utilised the test developed by Zivot and Andrews where the result shows contradict results from the conventional approach which has been utilised previously. The results show the potential break of 1992 and 2001 for company tax revenue and personal tax revenue respectively. Having identifies the potential break which exist from ZA unit root test the analysis for cointegration is conducted by utilising the Gregory Hansen approach. By employing the Gregory Hansen tests our study also reveals that there exists a cointegrating relationship between company tax – stock market after allowing the structural breaks but not for the personal tax and stock market. However, of the three possible structural breaks, the one with an intercept shift and regime yields meaningful cointegrating coefficients. Our results imply that there exist a long run relationship between company tax and stock market in Malaysia. This result is consistent with the Malaysia economic situation as well as the trend of tax revenue collection where the major contributions of the economic development come from the private

sector. Therefore the government should focus on formulating the policy which can woo investment in stock market as well in other financial market activities to increase the revenue collection which can help to encourage the development of the country. In addition even though the results failed to identify any significant relationship exist between personal tax revenue, the government still should put full effort to promote investment activities among individual to support economic development.

INDEPENDENCE AND FIRM PERFORMANCE

Patricia B. Abels, The University of Findlay
Joseph T. Martelli, The University of Findlay

ABSTRACT

Scandals resulting from poor ethical choices have hindered both the integrity of the financial markets and the systems of corporate governance. Free enterprise is a foundation of the United States economy, and capital markets are necessary in achieving such an enterprise. Investor confidence in both the capital markets and dealings of corporations is necessary in order to maintain a free enterprise system. Today, more than 50 percent of Americans invest within public companies and as a result, a corporation's performance affects investors. Investors utilize financial statements and related disclosures as primary sources when analyzing risk and return in order to make informed investment decisions. Public corporations must comply with the Security and Exchange Commission requirement to disclose information surrounding its governance policy. The accountability, ethics, honesty, integrity, and reliability of corporate directors and officers, in addition to the accurate, complete, reliable, and transparent financial reports affect investors. A fiduciary responsibility exists with the board of directors to protect the interests of shareholders. The shareholders expectation of management is to make decisions in their best interest for wealth maximization. Performance pressures from the market could impair the decisions made by management. Our study seeks to compliment the literature by revealing the independence of Chief Executive Officers and Chairmen, which can influence both the perceived independence of management and company performance. We report empirical evidence to confirm or reject the current extent in which independence influences company performance.

KEYWORDS: Board of directors, capital markets, governance regulation, statistical study

INTRODUCTION

A fundamental objective of businesses is generating wealth for its shareholders. Investor confidence in both the capital markets and dealings of corporations is essential in order to sustain a free enterprise system. The organizational structure of businesses defines the policies surrounding the relationships between the board of directors, management, shareholders and stakeholders. Chief Executive Officers (CEO) had held both dual titles and responsibilities as CEO and Chairman. According to the agency theory, duality increases an organization's agency cost because agents could forgo opportunities that principals consider to be in their best interest in order to pursue their own self-interest instead. As a result, duality positions authorize CEOs to exercise board control in order to satisfy their own personal goals.

Poor ethical choices made by management have hindered the integrity of the financial markets and the systems of corporate governance. Top management initiates the ethical corporate culture and the dealings of management often speak louder than words. The purpose of this study is to compliment the literature by revealing the independence of CEO and Chairman within United States (U.S.) corporations. Titles and roles of CEOs can influence both the perceived independence of management and a company's performance. We begin our discussion with an overview of the relevant literature. In particular, we consider the significance of the capital markets in raising long-term corporate financing. A discussion on the importance of board independence and recent government reforms follows. We conclude our literature review addressing corporate performance. We then discuss our research design and methodology, and our empirical findings. Our concluding comments end the manuscript.

LITERATURE REVIEW

Significance Of Capital Markets

Capital markets are a component of the financial system where public companies can obtain long-term debt and equity financing in order to raise its monetary needs for capital investments. The individuals who provide debt and equity financing to public companies are termed investors. When investors agree to supply the financing needs for organizations, repayment by a firm is uncertain. Investors expect compensation from firms when they agree to assume risk, such as interest or stock performance. An underlying objective of businesses should be generating wealth for its shareholders, as reflected by maximizing the market price of common stock (Keown, Martin, & Petty, 2011). Stock prices reflect the worth of an organization as perceived by shareholders, and it includes the complexities of risk along with all publicly available company information.

Today, more than 50 percent of Americans invest within public companies (e.g. retirement) and as a result, a corporation's performance affects investors (Rezaee, 2009). An efficient corporate governance structure should promote shareholders interests of wealth maximization, which can be achieved by a company's strategies and operational performance (Rezaee, 2009). In order to oversee management and protect shareholder interests, external and internal monitoring systems have evolved over time. According to Rezaee (2009), external mechanisms monitor a company's activities, affairs and performance of management, directors and officers (e.g. capital markets, labor markets, State and Federal regulations). Whereas internal mechanisms direct, manage and monitor corporate activities for the creation of shareholder wealth (e.g. audit committee, board of directors, internal controls). Both external and internal systems are vital in encouraging management to execute their responsibilities in alignment with shareholder expectations. Protection of investors "through appropriate regulations, effective corporate governance, and optimal market mechanisms" is essential in order to promote investor confidence (Rezaee, 2009, p. 4). Investor confidence in both the capital markets and dealings of corporations is necessary in order to maintain a free enterprise system.

Independence Of The Board Of Directors

The board of directors is a group nominated by shareholders to represent them within the corporate decision-making process. CEO duality occurs when a CEO also functions as the Chairman of the Board. Directors have accountability to shareholders, which includes monitoring the dealings of management and taking remedial measures against management, such as dismissal (Fairchild & Li, 2005). The central external party of a corporation is shareholders (Van Ees, Gabrielsson, & Huse, 2009).

When a CEO holds the title of Chairman, the perceived independence of the board of directors becomes weak. The directors have a fiduciary responsibility to safeguard the welfare of shareholders. Additionally, the directors oversee the dealings of corporate management, offer strategic advisement and acquire external resources (Elsayed, 2007). The board of directors guides a corporation and the board is indispensable in the governance of organizations (Fairchild & Li, 2005; Van den Heuvel, Van Gils, & Voordeckers, 2006). Corporate governance is the control mechanism that oversees the behavior of management and depicts the authority given to CEOs (Bozec, 2005). The practice of splitting the role of CEO and Chairman within public corporations has gained the attention of the Federal government, American stock exchanges, shareholders and stakeholders. These groups have requested U.S. corporations to modify corporate governance policies and promote transparency. Separating the dual role has been gradually increasing within U.S. corporations (Neff & Charan, 2010). For instance, approximately 23 percent of large 500 U.S. based companies have non-CEOs holding the title of Chairman in 1996, which is a rise from roughly 16 percent in 1993 (Frazee, 1997). Additionally, CEO turnover between 2008 and 2010 of Fortune 500 firms indicated a 40 percent drop in duality for newly

hired CEOs (Abels & Martelli, 2011). Shareholders generally tend to support separating the responsibilities of CEO and Chairman, especially in poor performing companies, because board independence is improved and personal conflicts of interest diminishes (Rezaee, 2009).

Corporate Governance Reforms

Past scandals signify a need for both external and internal procedures to protect shareholders and stakeholders from corporate abuse and misconduct (Rezaee, 2009). Business failures triggered by financial statement fraud, restatements of financial reports, and concerns over an auditor's independence, objectivity, and credibility have hindered investor confidence in corporate America (Rezaee, 2009). The conduct exhibited by companies gave way to corporate governance reforms. State and Federal laws, listing standards of national stock exchanges, and professional organizations and shareholder proposals endorsed enhancements of governance policies in the U.S. (Rezaee, 2009). Regulations that further shield the investor, while encouraging companies to execute business in the most competent, ethical and legal manner possible emerged (Rezaee, 2009). Regulation generally establishes the minimum criterion that public and society are willing to accept (Logsdon & Yuthas, 1997). The organizational structure of a corporation delineates a firm's policies and its relationships involving the board of directors, management, stockholders and stakeholders. CEOs are accountable for running the daily operating activities of corporations whereas Chairmen are responsible for the board of directors, including CEO succession, corporate governance and senior management recruitment (Lublin, 2009). The foundation of corporate governance rests on adequate disclosures, whereby allowing public confidence and trust to increase within those organizations. The board of directors monitoring function has intensified because of the devastation created by recent corporate scandals. Additionally, globalization has weakened government control, which also creates a need for accountability within organizations (Abdullah & Valentine, 2009). As a result, companies are beginning to separate the roles of CEO and Chairman.

Corporate Performance

Scholarly publications of Anderson, Deli and Gillian, 2004; Brickley, Coles and Terry, 1994; Byrd and Hickman, 1992; Cotter, Shivdasani and Zenner, 1997; and Dann, Del Guercio and Partch, 2003, found independent directors are linked with higher firm value, although other studies did not substantiate this evidence (Chhaochharia & Grinstein, 2007). There is little confirmation within the literature to propose separating the roles of CEO and Chairman improves profits, sale revenues or shareholder returns. Furthermore, there is modest substantiation that organizations under the management of its founding CEO perform different from organizations overseen by non-founding CEOs (Jayaraman, Khorana, Nelling, & Covin, 2000). Organizations with CEO duality and few independent board members have been associated with both bankrupt and going concern firms within the U.S. (Van den Bergh & Levrau, 2004).

Scandals resulting from inferior ethical choices have hindered both the integrity of the financial markets and the systems of corporate governance. Business ethics deals with the conflicts of interest, ethical issues and the morality of business decisions (Rezaee, 2009). A 2007 survey found that 77 percent of employees consider the behavior of management sets the tone for ethical behavior within the workplace (Rezaee, 2009). A corporate ethical culture commences with top management, since management actions can often speak louder than words (Rezaee, 2009). Ethical decisions lead to both investor confidence and vital capital markets. Recent governance developments demonstrate the significance of ethics. Corporate governance reforms have enhanced the accountability of boards and management while at the same time encouraging the independence of CEOs and Chairmen.

DATA AND METHODOLOGY

The intention of this analysis is to compliment the literature by revealing the independence of CEO and Chairman within U.S. corporations. Titles and roles of CEOs influence both perceived independence of management and company performance. Our study adds further empirical evidence to confirm or reject whether titles of CEOs influence performance in large corporations within the U.S. Companies selected for our study were the top 500 companies in the U.S. in terms of sales revenue. Fortune Magazine 2008 listing contained the leading revenue producing firms in the U.S. Our database included 500 companies and a complete data set was available on all 500 CEOs represented within our study. In order to enhance the accuracy of our study, we cross-referenced CEOs as reported by Fortune Magazine to Mergent Online, a business research database. Our study determined the titles of CEO and Chairman as reported by Mergent Online. The North American Industry Classification System (NAICS) was the product classification system employed for establishing a company's principal industry sector. Our analysis was restricted to the two-digit level within the complete six-digit NAICS codification.

EMPIRICAL RESULTS

Our 2008 study of CEOs revealed that 61 percent of CEOs held titles of CEO/Chairman and 39 percent did not hold duality titles. The downward duality trend continued within large corporations located in the U.S. In reviewing our industry frequencies, 11 of the 18 reporting industries exceeded our 61 percent average for CEO duality titles. Overall, the results indicated CEO Duality was not important or statistically significant to company performance (unadjusted ROA). However, two-digit NAICS (Manufacturing, Construction, Retail, Mining and Accommodations), and Age (55-59) and Overall Education (Master Degree) were significant to firm performance (unadjusted ROA). Furthermore, the results indicated CEO Duality was not important or statistically significant to company performance (adjusted ROA). However, Age (55-59) was significant to firm performance (adjusted ROA).

CONCLUSION

Studies indicated that independent boards of directors were associated with higher firm performance, while other researchers found lower firm performance and yet other researchers found no significant differences in corporate profits. On a theoretical standpoint, our results signify CEO duality was neither important nor significant to corporate performance (adjusted ROA). Our results indicated that CEO age was important and significant to corporate performance (adjusted ROA). Boards of directors are fiduciary agents who legally work to shield its principals from conflicts of interest. In the mayhem of recent corporate scandals, the monitoring function of boards of directors has intensified. Using the top 500 companies in the U.S., based upon sales revenue, did limit our analysis to large U.S. corporations. Any statistical inferences or generalizations made beyond this population are spurious and non-statistical.

WHAT IS CSR ALL ABOUT?

Patricia B. Abels, The University of Findlay
Joseph T. Martelli, The University of Findlay

ABSTRACT

The stakeholder model, an emerging governance model, concentrates on a broader view of the corporation by including all stakeholders into the analysis for corporate performance. This view considers that public companies must also be socially responsible. The stakeholder model measures corporate performance by including financial indicators (e.g. earnings, market share, stock price), social indicators (e.g. customer satisfaction, employment, fair-trading with suppliers), ethical indicators (e.g. business code of conduct, proper business culture), and environmental indicators (e.g. antipollution, preservation of natural resources). Shareholders are considered the primary recipient of financial performance reports; however, stakeholders are becoming interested in public companies based upon various economic, environmental, ethical, governance, and social concerns because all stakeholders are affected by the success or failure of a company. Today, corporate governance viewpoints could include multiple goals of both shareholder and stakeholder since the success or failure of a firm affects them. Morgan Stanley Capital International evaluates companies based upon its impact on the community, customers, employees, environment, governance, society, and supply chains. Our study compares social the responsibility of corporations with company performance for 422 firms among the Fortune 500. We report empirical evidence to confirm or reject the current extent in which social responsibility influences a company's performance.

KEYWORDS: Corporate social responsibility, firm performance, G-score, stakeholder model

INTRODUCTION

Business ethics deals with the conflicts of interest, ethical issues, and the morality of business decisions. The unethical corporate and management behavior experienced in the United States (U.S.) has stakeholders interested in the actions of public companies. The success or failure of a company affects stakeholders. Ethical decisions lead to both enhanced investor confidence and vital capital markets, and recent governance reforms confirm this ethical importance. Corporate Social Responsibility (CSR) is a voluntary mechanism deployed to enhance both a company's public image and reputation. Fortune 500 firms have implemented and publicized its CSR activities, while at the same time, earning positive returns for shareholders. Concentrating on the stakeholder model, this paper investigates if CSR, measured by an index for Corporate Governance Score (G-Score), influences company performance within the largest 500 firms in the U.S., as reported by Fortune Magazine in 2008. The discussion begins by defining corporate social responsibility and the theory that explains this relationship. Following is a discussion of performance measurements. The research design is quantitative and analyzes the G-Score impact within the largest 500 U.S. firms. There is a discussion addressing the empirical results of the analysis followed by concluding remarks.

LITERATURE REVIEW

Corporate Social Responsibility

Corporate Social Responsibility is a voluntary way for companies to enhance its public image and reputation by incorporating responsible activities that satisfies a need of society beyond its legal

requirements (Lii & Lee, 2012). The European Commission (2001, pg. 5) has defined CSR as “a concept whereby companies decide voluntarily to contribute to a better society and a cleaner environment.” CSR relates to environmental protection, health and safety at work, human resource management, and positive relations with local communities, consumers and suppliers (Branco & Rodrigues, 2007). Societal needs can range from integrating projects that preserve the natural environment, practicing organizational fairness and support to employees, improving the quality of life within the local community in which firms operate, providing high quality services to customers, and incorporating strategic decisions benefiting the investors (Lo, Egri, & Ralston, 2008).

Corporate Social Responsibility can be a source that enables firms to gain a competitive advantage within its industry. Corporations with a positive public image and reputation may be able to charge premium prices for its products or services (Klein & Leffler, 1981; Milgrom & Roberts, 1986b) and increase its pool of applicants with higher quality individuals (Stigler, 1962). Additionally, firms can enhance its monetary access through the capital markets (Beatty & Ritter, 1986), and attract external investors for its firm (Milgrom & Roberts, 1986a). Bhattacharya and Sen (2004) found that more than 80 percent of Fortune 500 companies publicize its CSR activities on its company websites and Luo and Bhattacharya (2006) found that over 90 percent of these firms have CSR projects in place. A study of Fortune 500 firms also revealed that return on assets (ROA) had a high correlation with social responsibility (Fombrun & Shanley, 1990). A favorable reputation can permit firms to earn excess returns for its shareholders (Fombrun & Shanley, 1990).

Theory

Differing theories conceptualize CSR and the role business plays within the society. Today, corporate governance viewpoints could include multiple goals of both shareholder and stakeholder (e.g. communities, customers, employees, government, suppliers) since they are affected by the success or failure of a firm (Heath & Norman, 2004; Jensen, 2001). The prime rationalization of the shareholder (principal-agent) theory is to simplify the relationship between the principal (shareholder) and its agent (management). Agents (management) have a duty to protect their principals (shareholder) and are not equally accountable to all stakeholders (Jensen, 2001; Sternberg, 1997). The U.S. typically focuses on the shareholder (principal-agent) view while Europe focuses on an integrated approach combining shareholder and stakeholder (Rezaee, 2009). The integrated approach recognizes a balance where satisfied secondary stakeholders can result in the goal of long-term wealth maximization for the primary shareholders (Gibson, 2000; Perez Carrillo, 2007).

Stakeholder model, an emerging model, concentrates on a broader view of the corporation by including all stakeholders into the analysis for corporate performance. This view considers that public companies must also be socially responsible (Berrone, Surrocca, & Tribo, 2007). The stakeholder model measures corporate performance by including financial indicators (e.g. earnings, market share, stock price), social indicators (e.g. customer satisfaction, employment, fair trading with suppliers), ethical indicators (e.g. business code of conduct, proper business culture), and environmental indicators (e.g. antipollution, preservation of natural resources) (Rezaee, 2009). Shareholders are still the primary recipient of financial performance reports; however, stakeholders are becoming interested in public companies based upon various economic, environmental, ethical, governance, and social concerns because all stakeholders are affected by the success or failure of a company (Rezaee, 2009).

Performance Measures

Expressing the value of one financial number relative to another financial number permits a comparison by ratio analysis for interpreting the raw numbers found within a firm's financial statements. Creditors, managers, and shareholders use financial ratio analysis for decision-making. Creditors might use ratios to

determine whether a business has sufficient cash flow to repay its debt and interest. Managers might use ratios to judge a company's performance compared to its established goals. Shareholders might use ratios to predict what the value of their stock is in the long-term. In the literature, ROA and Tobin's q ratio have been the most common measurements when analyzing firm performance (Carter, Simkins, & Simpson, 2003; Kaymak & Bektas, 2008).

Financial ratios compare companies and industries as being equal during the analysis (Liu & O'Farrell, 2009). The financial results reveal the strengths and weaknesses of companies in order for decision-makers to make an informed conclusion. In past studies of corporate performance, financial accounting ratios are used and some researchers incorporate a market valuation measure instead by utilizing Tobin's q ratio (Chen, Lin, & Yi, 2008; Elsayed, 2007). Subsequently researchers suggest that financial accounting ratios and Tobin's q ratio are complimentary rather than substitutes for measuring corporate performance (Elsayed, 2007). As a result, empirical research utilizes both financial ratios and Tobin's q ratio (Amato & Wilder, 2004; Elsayed, 2007). When conducting a cross-industry comparison, financial ratios (e.g. ROA) in its present form is inadequate because certain industries may be prone to experience higher or lower ratio results. In order to control for the industry effect, an industry average is calculated. The industry average reduces the ratio result for each firm, thus removing the industry effect (Berrone, Surrocca, & Tribo, 2007).

DATA AND METHODOLOGY

The purpose of this study is to seek additional empirical evidence to confirm or reject the current extent in which CSR influences company performance in large corporations within the U.S. Companies selected for this study were the top 500 companies in the U.S. in terms of sales revenue as published by Fortune Magazine in 2008. The Fortune 2008 listing is a compilation of top revenue producing firms in the U.S. based upon fiscal results for 2007. Our database included 500 companies. The North American Industry Classification System (NAICS) was the product classification system utilized for establishing principal industry sectors for the companies under analysis. The NAICS codification contains a six-digit-coding scheme established by the U.S. Federal government, which permits a comparison of organizations within North America. Our analysis was limited to the first two-digit level found within the complete six-digit code.

Corporate governance scores was a variable of interest for the study. We retrieved G-Scores for the study from Andrew Metrick's website. Andrew Metrick is a Professor of Finance at Yale School of Management and he has permission to post the G-Score index through the Wharton Research Data Services. Morgan Stanley Capital International (MSCI) evaluates companies based upon its impact on the community, customers, employees, environment, governance, society, and supply chains. MSCI updates and publishes the G-Score index at the end of each year. Our study utilized the G-Score index for the year ending 2006, which is analogous to the beginning of 2007. The selected G-Score corresponds with a company's performance during fiscal year 2007 and reported by Fortune in 2008. Our database included 422 G-Scores within the study.

EMPIRICAL RESULTS

The dependent variable for measuring corporate performance was ROA, an accounting based measure computed by taking net income and dividing by total assets of the firm. An industry adjustment to the ROA allowed us to remove the effects of a specific industry upon the ROA. The results of a linear multiple regression using step-wise indicated that CSR, as measured by G-Scores, were not statistically significant to firm performance as measured by ROA, unadjusted and adjusted. Our analysis indicated that other variables besides CSR tend to influence corporate performance.

CONCLUSION

Scandals resulting from poor ethical choices have hindered both the integrity of the financial markets and the systems of corporate governance. Business ethics deals with the conflicts of interest, ethical issues, and the morality of business decisions. Mostly unethical corporate and management behavior is the underlying factor for the recent turbulence experienced in the U.S. Ethical decisions lead to both enhanced investor confidence and vital capital markets, and recent governance reforms confirm this ethical importance. Our research study revealed the status of the relationship between CSR with corporate performance. Using the top 500 companies in the U.S., based upon sales revenue, did limit the study to large corporations within the U.S. Any statistical inferences or generalizations made outside of this population are spurious and non-statistical.

PROSPERITY OF FORTUNE 500 COMPANIES

Joseph T. Martelli, The University of Findlay

Patricia B. Abels, The University of Findlay

ABSTRACT

In the past, corporate headquarters for all major United States enterprises tend to cluster around large metropolitan areas. It is within these large metropolitan areas that companies were able to locate the necessary infrastructure, such as support services, major airports, major highways, and telecommunications, all which were been deemed critical components in order to carry out the activities required for those organizations. Firms that locate within larger metropolitan areas have found the additional benefit of being able to recruit and retain a more highly skilled professional when firms are centrally located in proximity of large metro areas. Today, the nation has seen a shift in the location of corporate headquarters within the United States, even though the volume of sizeable publicly traded companies in the United States grew by 37 percent. Our research delves into Fortune 500 companies by examining the geographical settling, industry makeup and revenue contributions as a means of determining where industry centralizes and why industry thrives.

KEYWORDS: Company diversity, company employment, descriptive study, Fortune 500 companies

INTRODUCTION

Large metropolitan areas used to be the home for corporate headquarters for major United States (U.S.) enterprises. The nation has seen a shift in the location of corporate headquarters, even though the volume of publicly traded companies grew by 37 percent. Contributing to the relocation was smaller firms exhibiting growth and now appearing within the Fortune 500 ranking. The composition of Fortune 500 companies can include distinguishing features such as geographic location, industry sectors, products/services, profits and revenues. Concentrating on the product difference approach, products and services rendered by companies permitted an appropriate breakdown of a firm's diversity. The purpose of this empirical investigation is to compliment the literature by exploring, describing and explaining the composition of companies within the U.S. Companies selected for this study were the top 500 companies in the U.S. in terms of sales revenue as published by Fortune Magazine in 2008. The discussion begins by examining the geographic location of firms and an understanding of how firm diversity within the U.S. is determined. Following is a discussion addressing revenues, profits and employees of companies. The research design is descriptive and the study analyzes prominent companies within the U.S. There is a discussion addressing our methodology and results of our analysis followed by concluding remarks.

LITERATURE REVIEW

Geography Of Firms

In the past, corporate headquarters for all major U.S. companies settled around large metropolitan regions. It is within these large metropolitan regions that businesses could locate necessary infrastructures, such as major airports, major highways, support services and telecommunications. These infrastructures are critical components in order to conduct business activities for many organizations (Klier & Testa, 2002). For example, in 1955, 31 percent of all corporate headquarters in the U.S. were located within the New York metro region. From this, Fortune Magazine reported within its first published 500 ranking that 28 percent of the enterprises ranked as being leaders within the U.S. (Diacon & Klier, 2003). The recruiting

and retaining of a more highly skilled professional is an additional benefit of locating within the larger metropolitan regions (Klier & Testa, 2002).

Recently the country has seen a movement of corporate headquarters, even though the number of publicly traded companies grew by 37 percent (Diacon & Klier, 2003). For instance, in 1999, Fortune 500 companies accounted for only 10 percent of corporate headquarters within the New York metro region, resulting in a 64.3 percent decline in Fortune 500 corporate headquarters since 1955 (Diacon & Klier, 2003). An underlying factor to this 64.3 percent plunge was smaller firms that exhibited growth and now appear within the Fortune 500 ranking. These smaller firms tend to be located within the mid-size metropolitan areas rather than urban areas (Klier & Testa, 2002).

Surpassing New York and the second ranked location of California, Texas is now the primary location of 58 corporate headquarters (Associated Press, 2008). According to Klier and Testa (2002), the move in industries tends to guide the relocation of corporate headquarters to other urban regions. Companies benefit when surrounded by other large companies, as a result, Texas will continue being the main beneficiary of relocated companies (Associated Press, 2008). Texas firms can provide a variety of essential business services, such as accounting, information technology and law to these firms.

Diversity of Firms

The composition comparison of Fortune 500 companies can include distinctive features such as geographic location, industry sectors, products/services, profits and revenues. Many authors have conducted research in order to enhance the understanding of firm diversity. According to Pitts and Hopkins (1982, p. 620), “there is no generally accepted definition or measure of diversification”. A inclusive literature review surrounding corporate diversity is unavailable (Ramanujam & Varadarajan, 1989). The lack of a conventional measurement permits researchers to employ his/her characterization in order to explore and evaluate firm diversity.

Different approaches utilized in order to categorize firm diversity include resource independence, market discreteness and product difference (Pitts & Hopkins, 1982). Resource independence categorizes firms based upon the organizations availability of internal resources. An organization is unrelated if “different production facilities and separate distribution channels were likely to be needed to properly run the two businesses” (Pitts & Hopkins, 1982, p. 621). The lack of public information identifying the internal resources of organizations permits a researcher to exercise subjectivity (Pitts & Hopkins, 1982). Researchers rarely use the second approach, market discreteness, because quantifying consumer preferences and other market characteristics is difficult (Pitts & Hopkins, 1982). The last approach, product difference, was the categorization utilized for this research. Product difference focuses on the different types of products or services offered by companies. According to Pitts and Hopkins (1982), product difference does combine the fundamental approaches of both resource and market because products and services satisfy different consumer needs.

A researcher should use a “highly detailed product classification system [that has been] established by the Statistical Policy Division, Office of Management and Budget of the Federal Government” when using product difference (Pitts & Hopkins, 1982, p. 621). In the past, the Standard Industrial Classification (SIC) was the product classification scheme in the U.S. The SIC was replaced in order to improve both the statistical comparability and consistency. The North American Industry Classification System (NAICS), a group of six digit codes, replaced the SIC coding scheme (Weir, 2004). NAICS has been used by the Federal and State government for statistical purposes and NAICS has been used by others, such as academics, business organizations, researchers and the public (Arbuckle, 1999). NAICS coding permits a comparison of organizations throughout North America. The first five coding digits are standard

throughout North America and the last digit is restricted for use in the home country. As a result, digit six can differ between Canada, Mexico and the United States.

Revenues, Profits and Employees of Firms

In 2005, Fortune 500 companies set a new record by generating a total of \$9.1 trillion in sales revenue and earning a bottom line of \$610 billion (McGirt, 2006). In 1955, sales revenue of Fortune 500 companies as compared to the Gross Domestic Product (GDP) was 39 percent and by 2006, this amount increased to 73.4 percent. The outlook for Fortune 500 sales revenue could conceivably surpass GDP for economic output in years to come (McGirt, 2006). According to the Organization for Economic Cooperation and Development (OECD), the global economy grew by 4.25 percent in 2005, which contributed to the higher profits earned by Fortune 500 companies (McGirt, 2006). The U.S. economy grew by 3.5 percent and Fortune 500 organizations increased their sales revenue by 10.2 percent, with combined profits of \$610 billion or an average increase of 18.8 percent (McGirt, 2006).

Sales revenue per employee is another manner of comparison across companies and within industries. Sales revenue per employee is an important operating performance ratio for management within the human resource department (Loth, 2008). Harnish (2006) stated that larger organizations have a greater employee contribution to revenue than its smaller counterparts because larger firms have professional management teams and a process in place that strengthens the value of an employee. Revenues per employee in 2005 were the highest within the energy related industry sector, with both health care and home construction sectors contributing over \$1 million in revenue per employee (Communication Workers of America, 2006). Low paying wage industries also demonstrated high revenue per employee. For instance, food and grocery firms generated \$637,514 per employee, while beverage organizations generated \$448,812 per employee (Communication Workers of America, 2006). Overall, U.S. business and industry revenue generated per employee was \$100,000 (Hoagland-Smith, 2007).

In 2004, “Employer and Nonemployer” firms in existence within the U.S. were 25,409,525 (United States Census Bureau, 2008). Similarly, the largest 500 revenue-producing companies in the U.S. reported approximately 24 million employees in 2004, resulting in an average of 50,000 employees per firm (Revell, 2005). By year-end 2005, Fortune 500 companies enjoyed an average increase in both revenues of 10.2 percent and profits of 18.8 percent, while at the same time increasing its headcount by only 2 percent (Communication Workers of America, 2006).

DATA AND METHODOLOGY

The purpose of our investigation is to compliment the literature by exploring, describing and explaining the composition of companies within the U.S. Companies selected were the top 500 U.S. companies in terms of sales revenue as published by Fortune Magazine in 2008. Our database included a complete data set on all 500 companies represented within the study. In order to improve the accuracy of our study, we cross-referenced companies reported by Fortune Magazine to Mergent Online, a business research database. NAICS product classification system established our breakdown for principal industry sectors. Our analysis was limited to the first two-digit level of NAICS. Our descriptive investigation does not substantiate generalizations across other businesses. The goal of this study is to provide some level of insight concerning the distinctiveness of the top 500 companies within the U.S. The results of our study are valid to Fortune 500 companies and not intended for statistical generalization beyond this population.

EMPIRICAL RESULTS

In 2008, the manufacturing sector clearly dominated the economic sectors within the U.S. Geographically; Southern U.S. (which includes Texas) was the largest home for Fortune 500

headquarters. The manufacturing sector was the predominant form of business throughout the four U.S. census divisions. On a regional breakdown, the information sector dominated the Mountain region, while manufacturing remained the prevailing mode of business within the other eight U.S. regions. Fortune 500 companies generated a total of \$10.6 trillion in sales revenue, representing a 16.5 percent increase over the reported figure of \$9.1 trillion in 2005. In 2005, Fortune 500 companies reported \$610 billion in profits, and today, those firms earned \$645 billion, which was an increase of 5.7 percent. In 2008, the average industry revenue per employee within Fortune 500 companies was \$418,901 in contributions. Today, Fortune 500 corporations employ a workforce of over 25.3 million, a 1.3 million (5.6%) increase since 1994.

CONCLUSION

Utilizing a detailed classification system (NAICS), categorization of Fortune 500 firms based upon product or service diversity was possible. These leading organizations are predominately within the manufacturing sector, which translates into the manufacturing sector as being large contributors of employment and sales revenue within the U.S. This study is limited to the geographical boundaries of the U.S. and the large corporations that constitute the Fortune 500 composite. The results contained in this report do not serve as a domestic or global generalization of all companies.

ACCOUNTING STUDENT AND LECTURER ETHICAL BEHAVIOR: A REVIEW OF INDIVIDUAL FACTOR GENDER AND LOCUS OF CONTROL

Diah Hari Suryaningrum, University of Brawijaya*
Sri Hastuti, Universitas Pembangunan Nasional "Veteran" Jatim
Dwi Suhartini, University of Airlangga

ABSTRACT

Researches on ethical behavior have been conducted for reason in understanding human behavior in their environment. It became issues in Indonesia since there are many cases that involve accountant's behavior on their professional role. This study aims to provide empirical evidence on ethical behavior issue on accounting student and lecturer in private university in Surabaya-Indonesia. We added personal variable of gender and locus of control for reasons that women in Indonesia have been treated as second citizen, not only in education but also in working environment, even if efforts of emancipations have been carried out for many years; and locus of control as individual factor represents on how individual react in making decision. Of 23 private universities in Surabaya, about half of these universities and 548 respondents engaged in the survey. The universities were separated upon their accounting program accreditation. Using analysis of variance and Pearson correlation, result of this study: First, women's ethical attitudes were better than men's. Second, it was also concluded that individual with internal locus of control are more reluctant to do unfair and unethical attitude than individual with external locus of control. Finally, accounting program with better accreditation revealed good ethical behavior, even though the difference was statistically not significant.

INTRODUCTION

The gender difference is not really a problem as long as it does not deliver gender injustices. In terms of education, the condition and position of women in Indonesia still lagged far behind men. It can be seen in data showing the less female learners at higher education and levels of illiteracy for women 5.3% higher than 2.7% in men (Pulungsih, 2007). In Indonesian society, there are a number of traditional cultural values that laid the main tasks of women is in domestic positions. If the funding sources of a family are limited, then the school should come first to the boy. We must be concern that although the task of women is in the domestic area, one of which is in educating children and keeping the welfare of the family, for this reason women should remain knowledgeable for the task. Limitations of education and training opportunities for women to improve education to gender equality still require a more serious struggle. Ameen, et al. (1996) conducted a survey to prove the relationship between gender factors with willingness to tolerate unethical academic behavior. Research on gender has been done since the late 70s, and the number of female accounting students is rapidly increasing. Many female accounting students become top performers in the classroom and more involved in activities related to accounting. Research results indicate that female accounting students are more sensitive to ethical issues and less tolerant of unethical behavior than male students are. In the world of work, women accountants cannot be separated from gender discrimination (see: Maupin, 1993, Larkin, 1990, and Lehman, 1990). In general, the inclusion of women in the labor market, including the fields of accounting, at this time showed a greater

amount (McNicholas, 2004). However, discrimination against women remains a major problem (Hasibuan, 1996). Research in Indonesia, Santosa and Hardiningsih (2004) in their study stated that the factors that leading to only a few women who reached a career peak can be grouped into external and internal constraints. External constraints include a stereo type that considers men and women have differences in managerial behavior. Male managerial behavior is deemed better to achieve excellence in the organization. Another external constraint is sex harassment; women who occupy managerial often face sex harassment because of her position as a minority in the managerial ranks.

Next is the discrimination, which arise as a result of continued existence of a stereo type, because women are considered less appropriate in her managerial functions, then the chance are restricted, for example, the opportunity to obtain the training or promotion. While the internal constraints such as poor women ability in building informal network with people who have authority. Women also lack an understanding of the rule (the rule of the game) and the sense of competition, as well as too passive and not planning a career related to her status as housewives. This research was conducted in the fields of accounting, given that as a member of a profession, accountants, whether public accountants, educator accountants, the company's internal accountants or government accountants have an obligation to maintain the highest ethical behavior to the organization where they work, their profession, community, and themselves. Accountants have a responsibility to be competent and maintain the integrity and objectivity.

In Indonesia, the issue of accounting ethics developed along with the occurrence of multiple violations of ethics, undertaken by the accounting profession. For the case of public accountants, based on the report of the Honorary Board of IAI (Institute of) in the accountability reports in 1990 – 1994 period, there were many cases of ethics violations involving 53 Public Accountant (Husada, 1996). Other case of ethical behaviour is quite fenomental (because it involves institutions in the U.S. capital market authority.) The case was involving the audit of PT. Telkom by a Public Accountant Office. In this case, SEC (Security Exchange Comission) did not recognize the audited financial statement of PT. Telkom (Accounting Media, 2003). In the field of accounting, research on ethics has been widely applied.

Regis and Sularso (2002), Sihwahjoeni and Gudono (2000), and Ludigdo and Machfud (1999) research focuses on the problem of perception against the code of ethics of accountants and business ethics are associated with accounting education curriculum. Maryani and Ludigdo (2001) in the partial results of their survey described the factors that influence attitudes and ethical behavior of accountants. Research conducted by Glenn and Loo (1993), Fischer and Rosenzweig (1995), and Stevens et al (1993) found that accounting students tend to show ethical awareness level the practitioners lower than the non-accounting students (O'Clock and Okleshen, 1993). Based on the cases that occurred and the research findings above, it was quite apprehensive because the accounting profession is closely related to ethical issues. This raises the question on how exactly accounting student learned about ethics and how the ethics of accounting lecturers themselves. This study took the starting point of the research conducted by Amen, et al. (1996) by adding the study with variable of locus of control as well as gender as individual factors.

The object of this study is not only on accounting students but also on accounting lecturers. Gender is the focus of this research because researchers intend to prove that women actually have potential ability not less than or equal to men. We added the variable locus of control due to individual factors shows how one can deal with and control an incident that happened in one's life. The addition of accounting lecturers as the object of this research is primarily due to their influence to the ethical behavior of accounting students (Khomsiyah and Indriantoro, 1998). Therefore, in addition to test and demonstrate ethical behavior in accounting students and accounting lecturers in terms of individual factors of gender and locus of control, this study also intends to look at the relationship between ethical behavior of accounting students and accounting lecturers. The results of this study are expected to provide empirical evidence that education for women is really to be fought, especially in higher education. In addition, the results of this study are expected not only to provide benefits to the content of ethics education in accounting curricula, but also as

input on higher education that women need to get a similar education with men. Further, when the results of this study prove that there is a relationship between ethical behavior of accounting lecturers and students, the Indonesian Institute of Accountants should also begin to notice the professional ethics associated with the accounting profession as an educator.

LITERATURE REVIEW

Ward, et al. (1993) defines ethics as a complex process of determining what to do in certain situations. According to Wahyudin (2003), normative ethics is divided into two aspects, namely the moral accountability benchmarks and happiness. Moral accountability benchmarks include ethical revelation, ethics rules, and relativism. The ethics normative to happiness involve egoism, self-development, and utilitarianism. Siagian (1996) mentions that there are at least four reasons why learn to do ethics is very important. First, the ethics of human guide in selecting the various decisions faced in life. Second, ethics is a pattern of behavior based on the agreement so that the values of a harmonious life can be achieved. Third, the dynamics of human life led to changes in moral values that need to be analyzed and reviewed.

Fourth, encourage ethical instincts of morality and human inspired for both looking for, find, and apply the essential values of life. According Keraf (2001: 33-35), ethics are divided into general ethics and special ethics. Special ethics subdivided into three groups: individual ethics, environmental ethics, and social ethics. Social ethics talk about the obligations and rights, attitudes and behavior patterns of humans as social beings who interact with each other. Ethics is concerned with individual relationships between people with one another and about the social interaction. Social ethics are about professional ethics. Emphasis on professional ethics demands on one's profession, which in this case concerns about the expertise and moral commitment (responsibility, seriousness, discipline, and moral integrity). Larkin (2000) states that the ability to identify ethical and unethical behavior very useful in all professions including auditors. Thus, public confidence in the profession will be damaged if the auditors perform actions that are unethical.

Gender And Ethical Behaviour

Research conducted by Ameen, et al (1996) concerning the relationship between gender with ethical sensitivity required for the more rapid growth of female accounting students. Based on the survey conducted, Ameen showed that female accounting students are more sensitive to ethical issues and less tolerant than male students accounting are. In a business environment, especially in accounting practices, the number of women entering the work force occupied a great portion of the accounting and business community, an important reason for the evaluation of whether gender differences affect ethical perceptions of accounting students (Clikeman et al., 2000). Betz et al. (1989) suggested that a difference in ethical orientation on gender is the area of social psychology known as the theory of gender socialization. Gender socialization theory argues that men and women are fundamentally different in moral development and its tendency to bring different values to the workplace.

Differences in values were seen from their attitude and ethical behavior. Based on this theory man puts more value on money, advancement, power and measuring the expression of individual performance, while women pay more attention to the harmonious relationship and help people. Similarly, Bussey and Maughan (1982) stated that American men are socialized in the instrument orientation that emphasizes achievement and problem solving, while women are socialized in the sense orientation that emphasizes the maintenance of relationships. Huton et al. (1996) researched the issue of gender effects on behavior in the form of attitudes, motivations, perceptions of discrimination, and the desire to move jobs on accountant. The results showed that there were indications of the influence of gender differences in the behavior of the attitudes, motivations, perceptions of discrimination and the desire to move jobs. Cohen et

al (1998) examined the influence of gender on ethical behavior proves that there are differences in intensity and ethical orientation among male and female non-practitioner accountants and accountants.

In Indonesia, Adib (2001), who is also motivated by the study Ameen et al. (1996), suggested that the ethical sensitivity of accounting students in an academic environment between men and women showed same ethical priorities. His results do not support the research by Ameen, et al. (1996) which indicated that the ethical sensitivity of accounting and non-accounting students did not show any differences. Another research (Abdurahim and Indriantoro, 2000) showed that there were differences in the attitude of men and women of accountant lecturers in the workplace. However, on examination of the motivations and perceptions of discrimination in the workplace, it is evident there is no difference. It also further proved that the female employees have higher sensitivity rate than male employees. Based on several studies mentioned above, there were inconsistencies regarding the ethical behavior between men and women. Therefore, this study proposes the following null hypothesis:

Ho1: there is no ethical behavior difference between male and female accounting students.

Ho2: there is no ethical behavior difference between male and female accounting lecturers.

Ho3: There is no relationship of ethical behavior between accounting students and accounting lecturers.

Ho4: There is no gender interaction on the relationship between ethical behavior of accounting students to accounting lecturers.

Locus Of Control And Ethical Behaviour

Locus of control, as a personality variable, defined as someone view of event, whether he/she feels can or can not control the events that happened to him/her (Brownell, 1981). A person with internal locus of control believes that what is happening to him/her (positive or negative events) is a consequence of one's own actions. Therefore, he/she always want to be in control of his/her being and always took the role and responsibility for any decision-making. Whereas a person with external locus of control believe that events in his/her life is influenced by fate, fortune, and power outside him/herself. Thus, the incident is outside his/her control. Reis and Mitra (1998) examined the effects of differences in individual factors on the ability to receive ethical or unethical behavior and proved that individuals with internal locus of control tend to be unwilling to accept a less ethical action. In contrast, individuals with an external locus of control tend to be more willing to accept certain actions that are less ethical. Furthermore, in relation to gender, they showed that women are more ethical behavior than men. Thus gender is a significant factor in determining ethical behavior and women are more ethical than men to perceive situations in business ethics. Based on the theory of locus of control, the behavior of auditors in a conflict situation will be influenced by the characteristics of its locus of control. Individuals with internal locus of control are more likely to behave ethically in a conflict situations than individuals with external locus of control.

In Indonesia, Muawanah and Indriantoro (2001) and Fauzi (2001) conducted a study on the influence of differences in individual factors on ethical behavior of students. They proved that accounting students with internal locus of control behave more ethically than accounting students with external locus of control. Thus, the results of this study support the research of Reis and Mitra (1998). Based on theory and research results mentioned above, we propose the following null hypothesis:

Ho5: There is no ethical behavior difference between the of accounting students with internal locus of control and accounting student with external locus of control

Ho6: There is no ethical behavior difference between the of accounting students with internal locus of control and accounting student with external locus of control

In this study, we added accounting education accreditation to determine whether a higher accreditation level indicated a higher level of ethical behavior. Since accreditation was determined to reflect the quality of the university, we propose the following null hypothesis:

Ho7: There is no ethical behavior difference between accounting students on the levels of accounting education accreditation

Ho8: There is no ethical behavior difference between accounting lecturers on the levels of accounting education accreditation

RESEARCH METHODS

Population And Sample

The population in this study is determined by the criteria of accounting students who have more than 120 credits and accounting lecturers in the faculty of economics of accounting department at a private university in Surabaya, east Java – Indonesia. The consideration we choose students whom have taken over 120 credits because they have taken courses that contain the teaching of ethics such as auditing and managerial accounting and they will soon complete their thesis for a degree in accounting. Numbers of respondents in the study are 436 for accounting student and 112 for accounting lecturers.

Variable Measurement

Ethical behavior is behavior or a response of someone in his/her environment regarding the rights and moral obligations and true or false values. Accounting Student Ethical Behavior were measured using instruments developed by Ameen et al. (1996). The instruments are grouped into three dimensions: unethical behavior at the time of examination, unethical behavior when conducting task groups or individuals, and unethical behavior when making paper. Ethical Behavior Accountants Lecturers were measured using instruments developed by the researchers by modifying Ameen et al. (1996) instrument. Instruments will be grouped into three dimensions, namely: unethical behavior related to the exams assessment, unethical behavior related to teaching and learning, and unethical behavior related to the research. Questionnaires will be given a value of 1 (very fair) to 5 (very unfair). We will calculate how much value the ethical behavior of the three existing setting and assess the overall score. Ethical behavior of the overall score will range between 23 (minimum) to 115 (maximum). Minimum score indicates a high level of ethical behavior, while the maximum score indicates a low level of ethical behavior.

Gender in this study was based on the concept of sex, a biologically determined nature. Gender in this case divided into two, male and female with a value of 1 for man and a value of 2 of female. Locus of control describes the individual's belief that individuals can influence the events associated with his/her life. Locus of Control was measured by using the instrument of Work Locus of Control Scale (WLCs). The instrument consists of 16 question items using a Likert scale of 1 to 4 points. LOC grouping was based on the score of the answer. The higher the score indicates an external LOC, whereas the lower the score is an internal LOC. Cut-off point groupings based on the mean score. Internal LOC was given a value of one and external LOC was given a value of zero.

RESEARCH RESULTS

Variables Description

Description based on the ethical behavior and locus of control variable of accounting students and accounting lecturers are shown in Table 1. The table showed that the average score of ethical behavior variable of accounting students was 1.94 in the assessment range criteria 1-5. This indicates that the value of 1.94 implies an average of accounting student has a good ethical behavior. Of the gender factor, the average score of ethical behavior of female accounting students is better than male students are. Of locus of control of accounting students, the average score were 2,94 which indicates that accounting students are likely to have an internal LOC. While the factors of gender, male students on average are more likely to have an internal LOC than female students.

Table 1: Description of Ethical Behavior and Locus of Control

No	Respondent	Ethical Behavior			Locus of Control		
		M	F	Average	M	F	Average
1	Accounting Students	2,01	1,89	1,94	2,93	3,04	2,94
2	Accounting Lecturers	1,16	1,20	1,18	2,98	3,03	2,92

This table shows the average score of ethical behavior and locus of control of accounting students and accounting lecturers. For ethical behavior, the lower the score indicates an ethical behavior, while for locus of control, the lower the score indicates internal locus of control (cutt of point 2,96 for accounting students and 2,93 for accounting lecturers).

Table 1 showed that the average score of ethical behavior variable of accounting lecturers was 1.18 in the assessment range criteria 1-5. This indicates that the value of 1.18 implies an average of accounting lecturers has a good ethical behavior. On the gender personality factor, the average score of ethical behavior of female accounting lecturers were better than male students were. On the locus of control personality factor of accounting lecturers, the average score were 2,92 which indicates that accounting lecturers are likely to have an internal LOC. While the factors of gender, male lecturers on average are more likely to have an internal LOC than female lecturers.

Comparison between accounting students and accounting lecturers for ethical behavior indicated that on average, accounting lecturers have a higher level of ethical behavior than accounting students. Likewise, on average, accounting lecturers are more likely to be an internal locus of control than accounting students. Statistical description of ethical behavior according to universities' accreditation (table 2) showed that ethical behavior of accounting students of "B" accounting education accreditation is higher than "A" and "C" accreditation. On the contrary, ethical behavior of accounting lecturers of "A" accreditation is lower than "B" and "C" accreditation.

Table 2: Ethical Behavior Based on Accounting Education Accreditation

No	Accounting Education Accreditation	Accounting Students			Accounting Lecturers		
		M	F	Average	L	P	Average
1	A	1,97	1,97	1,97	1,15	1,14	1,15
2	B	2,05	1,82	1,93	1,24	1,16	1,19
3	C	2,00	1,88	1,94	1,09	1,29	1,20

This table showed on average the ethical behavior and locus of control according to accounting education accreditation.

HYPOTHESES TESTING

The hypohtheses testing as showed in table 3 indicated that two of the eight of null hypotheses were rejected, which mean that females were as capable as males not only in higher education (students), but also in the work place (lecturers). Using gender variable, the ethical behavior between male and female students are different, with female students have a higher ethical behavior than male. On the contrary,

there is no difference of ethical behavior between male and female lecturers. On lotus of control variable, results point out that students with internal locus of control have a higher ethical behavior than students with external locus of control, while for lecturers there was no ethical behavior difference on internal-external lotus of control.

Tabel 3: Hypotheses Testing

Hypotheses	Respondent	N	Means of Ethical Behavior		F value (correlation)	Sig.	Decision	
			M/I	F/E				
Gender (Male – Female)								
1	Students	205	214	1,9986	1,8823	7,087*	0,008*	Ho rejected
2	Lecturers	49	59	1,1973	1,1680	0,925	0,338	Ho not rejected
3	Students-Lecturers	254	273	-	-	-0,10	0,920	Ho not rejected
4	Gender -Students- Lecturers	254	273	-	-	-0,15	0,874	Ho not rejected
Locus of Control (Internal – External)								
5	Students	196	223	1,8841	1,9876	5,577*	0,019*	Ho rejected
6	Lecturers	51	57	1,1741	1,877	0,198	0,657	Ho not rejected
Level of Accounting Education Accreditation								
7	Students	218	218	2,0134	1,8942	0,515	0,598	Ho not rejected
8	Lecturers	51	61	1,1625	1,2011	1,199	0,306	Ho not rejected

*This table shows the result of hypotheses testing. Hypotheses 1-2 and 5-8 used ANOVA, while hypotheses 3-4 used correlation Pearson test. *significant on the level of 0.05.*

DISCUSSION

These results prove that ethical behavior of female accounting students is different from the ethical behavior of male students, in which female students have a better ethical behavior than male students are. Verification of the ethical behavior of female and male accounting lecturers show female also have an ethical behavior better than male, although the difference was not statistically significant. There was also a difference of ethical behavior between accounting students internal locus of control and accounting students external locus of control. Accounting students with internal locus of control have a better ethical behavior than accounting students external locus of control. Conversely, there was no difference of ethical behavior of accounting lecturers. A person with internal locus of control believe that what is happening (positive or negative events) is a consequence of one's own actions (Brownell, 1981).

Therefore, the person always be in control and always took the role and responsibility for any decision-making. Whereas a person with external locus of control believe that events in his/her life was influenced by fate, fortune, and power outside him/herself. Six understandings can be derived from the results: first, the results of this study support the research done by Ameen, et al. (1996) and Abdurahim and Indriantoro (2000). Based on the survey conducted by Ameen et al. (1996) showed that female accounting students are more sensitive to ethical issues and less tolerant than male accounting students for unethical behavior. Abdurahim and Indriantoro (2000) showed that there were differences in the attitude of accounting lecturers in the workplace. However, on examination of the motivations and perceptions of discrimination in the workplace, it is evident there is no difference. Further, this result also proved that the female employee has a higher sensitivity rate than male employees. Huton et al. (1996) proved there was an indication of the influence of gender differences in the behavior of attitudes, motivations, perceptions of discrimination and the desire to move jobs. Second, the results of this study also support the theory of gender socialization that argues men and women are fundamentally different in moral development and its tendency to bring different values to the workplace. Differences in values were seen from their attitude and ethical behavior. Based on this theory he puts more value on money, advancement, power and measuring the expression of individual performance, while women pay more attention to the harmonious relationship and help people (Betz et al., 1989; Bussey and Maughan, 1982; Clikeman et al., 2000). Women are more ethical than men are. Thus gender is a significant factor in determining ethical behavior

and women are more ethical than men to perceive situations in business ethics. Third, this study also proves that there is no correlation between the ethical behavior of accounting students to ethical behavior of accounting faculty and there is no correlation between the ethical behavior of accounting students with the ethical behavior of accounting faculty by gender. The result is different from the results of research by Sudibyo (1995) which stated that accounting education has a major influence on the ethical behavior of accountants. Accounting education is not only responsible for the teaching of science in business and accounting (knowledge transformation), but also to educate students to be a complete human personality. Accountants as educator, who instill knowledge of ethics, should also have ethical behavior, so that students will be more able and willing to understand and accept that knowledge.

Ethical attitude will encourage ethical behavior as well. Therefore, the cultivation of ethical attitudes and ethical behavior of accounting lecturers are expected to encourage accounting students to behave ethically. The lack of correlation between ethical behavior of accounting students and accounting lecturers' ethical behavior may be caused by factors of understanding the questionnaires that were perceived differently among students and lecturers. Respondents may be inclined to fill out questionnaires to give the best answer or it can also be caused by meaningless of the questionnaire, so they cannot measure the ethical behavior of students and lecturers. This may be possible though the questionnaire used in this study have been used also in previous studies (Ameen et al., 1996; Khomsiyah and Indriantoro, 1998; Abdurachim and Indriantoro, 2000). Fourth, the results support the theory of locus of control, where the individuals with internal locus of control are more likely to behave ethically in conflict situations than individuals with external locus of control (Muawanah and Indriantoro, 2001).

The results also support the research Reis and Mitra (1998) and Fauzi (2001). Reis and Mitra research (1998) on the effects of individual differences factors in the ability to receive ethical or unethical behavior prove that individuals with internal locus of control tend to be unwilling to accept a less ethical action. In contrast, individuals with an external locus of control tend to be more willing to accept certain actions that are less ethical. Fauzi (2001) proved that accounting students with internal locus of control behave more ethically than accounting students with external locus of control. Fifth, this study proved that female students have a better ethical behavior than male students, so women should be given the opportunity to obtain a higher education level. In terms of education, the condition and position of women in Indonesia is still far behind compared to men women should not happen to remember which will play a major role in their children's education will provide a balanced example of ethical behavior than men. Traditional cultural values that put the main tasks of women is in domestic positions should begin to change with the increasing role of women outside home. It is very important to realize that although the task of women is in the domestic area, one of their tasks is to educate children and maintain families' welfare; therefore, women should get education to have the ability to perform the task. Finally, the results indicated that there was a difference of ethical behavior of accounting students and accounting lectures based on level of accounting education accreditation, even though the difference statistically cannot be proved.

CONCLUSION

The result shows that, first, using gender individual personality, female accounting students have a higher level of ethical behavior than male. Even though statistically there is no difference of ethical behavior of accounting lecturers, the mean values indicate that women accounting lecturers have a higher level of ethical behavior than men do. These mean female in Indonesian family should be considered to have a higher degree of education. Second, it was also concluded that individual with internal locus of control are more reluctant to do unfair and unethical attitude than individual with external locus of control. Finally, accounting program with better accreditation revealed good ethical behavior, even though the difference was statistically not significant. Even though the empirical result of this study support the theory of ethics, gender, and locus of control, at least four limitations should be carefully considered. First, the data were collected only at university in Surabaya city; the characteristic of these universities surveyed might

be different from those in other areas or countries. Hence, the present result should not be assumed to represent the general case. However, it may provide a fundamental reference for Indonesian accounting education, students, lectures, and family whose environments are similar to those in Surabaya City.

Second, since individual informant provide the empirical data, possible biases or preferences (e.g. learning styles, communication methods, social preferences, etc) may exist due to different personal experiences, family, or educational background. Third, this study didn't control for other variables (e.g. family's earning, students or lecturers' age, students or lecturers' background, etc) that may influence the relationship. Finally, this study use ANOVA and analysis of Pearson Correlation to test the hypotheses. Future research may conduct the same research with larger respondents (more than one city) to make the result more generalizable, use a control variable as a moderating variable, and use other analysis like multi-variate analysis.

BEAUTY AND THE BEAST: ACCOUNTING HYPERREALITY AND REALITY – A BAUDRILLARIAN POSTMODERNISM REVIEW ON GOODWILL

Diah Hari Suryaningrum, University of Brawijaya, Indonesia
Syaiful Anwar, Universitas Pembangunan Nasional “Veteran” Jawa Timur

ABSTRACT

The idea in this essay came on the one hand from a metaphor in understanding hyperreality – reality and on the other hand based on the Baudrillarian postmodernist perspective. Thus, this essay aims to understand hyperreality and reality in accounting by using a metaphor of a folk story – Beauty and the Beast and to review and analyze accounting for goodwill from the perspective of Baudrillarian postmodernism. Thesis by Macintosh indicated that today’s financial markets operate detached from reality in hyperreality, and these does not exist anything stable to support the financial economy in the “order of simulacrum.” Consequently, vital accounting information no longer refers to real referents, which mean that we live in the world of free-floating signs. In “the simulation era of today’s world,” accounting, just like all other areas of knowledge, faced with a crisis of representation. Goodwill is a hidden value that, generally, the accounting standards define in the following way: the value of the future economic benefit (internally goodwill) and the difference between fair value and book value of the firm (business combination). This essay concludes that the order of simulacrum (era of simulacra) of accounting for goodwill are as follows: first, era of proprietary; second, era of political economy; third, era of globalization; and finally, era of virtual. It is also suggested that understanding goodwill is important to determine whether information of goodwill has value relevance for decision-making.

KEY WORDS: metaphor, Baudrillarian postmodernism, hyperreality, era of simulacra, goodwill

...“seeing yourself seeing” and “seeing yourself sensing”
What begin as perception returns to affect the structures of society...

INTRODUCTION

Accounting can be viewed as a firms’ language (Suwardjono, 2010; 28), because accounting has a set of symbols, either words or numbers, which are used to communicate information from the provider of information to the user. Language is an important aspect in communication as language serves as a carrier of messages that contain a specific meaning. Meaning to be conveyed in the language may change over time or may differ depending on the information and the user's ability to read and understand it (Evans, 2008). Evans (2008) observed changes in accounting language using linguistic theory and emphasized his observations on the mechanisms and motivations that led to those changes. His paper concludes that changes in the language of accounting, including the transmission of language and culture, can provide historical information about the transfer of technical development, socio-economic, political or ideological process, power, and jurisdictional terminology. Therefore, the expression in language must be precise so that its meaning can be interpreted as its intended meaning. In order to have value, accounting information has to reflect the reality. Suwardjono (2010: 29) defines reality as the reality or the physical facts of the company's activities. If reality is defined as a fact or facts, then the company's physical activity is symbolized by the signs of accounting language should reflect the reality or factual. In this context, accounting will full with the measurement and assessment. Hendriksen and Van Breda (1992, 15) recognizes that:

“Accounting number and classifications vary with respect to the degree of interpretation that can be inferred by the reader of accounting reports. For example, the item ‘cash’ in the statement of financial condition is fairly well understood to mean what accountants intend it to mean. On the other hand, the classification of ‘deferred charges’ has no specific interpretation apart from the structural processes that given rise to it.”

That is, the numbers and accounting classifications vary greatly depending on the interpretation that can be inferred by the reader of financial statements. For example, “cash” in the statement of financial position (balance sheet) is quite well understood meaning in accordance with the meaning intended by the accountant. Instead, “deferred charges” does not have a specific interpretation to the reader of financial statements. Similarly, does the term “goodwill.” Goodwill in the statement of financial position is part of the intangible assets may have a different interpretation to the reader of financial statements. Goodwill is a concept in accounting (as the result of logical thinking), which seeks to represent part of the company that does not appear in the financial statements and appear only in the event of a merger, both individual and corporate (Zanoni, 2009; 1). In this context, the reality has been reduced to a concept. No longer reflects reality or factual reality, but simply reflects the symbol itself (hyperreality). If so, does the accounting of goodwill represent a reality or hyperreality? In this essay, I examine the accounting goodwill by using the perspective of Baudrillardian postmodernism. To understand the hyperreality and reality is in this perspective, I use the metaphor of the story of Beauty and the Beast. The purpose of this essay is to get an explanation whether the language of accounting, goodwill in particular, able to represent reality and the meaning that was intended by the accountant.

Beauty And The Beast: Story of "Beauty and the Beast" (in French: La Belle et La Bette) is a fairy tale, which was first published by Gabrielle-Suzanne Barbot de Villeneuve, published in *La jeune américaine, et les Contes Marins* in 1740. The most popular version was recorded by the French author, Madame Jeanne-Marie de Beaumont, and was first published in 1756 at the *Magasin des Enfants, ou une sage Dialogues entre plusieurs gouvernante et de ses élèves*; version of the English translation was published in 1957. Tale with a story similar to this story is found in many countries.

The Story Of Beauty And The Beast

The story of Beauty and the Beast

Once upon a time, there was a wealthy widower with three daughters. The two oldest children every day is always having fun, driving around town while wearing a Prada dress, a cocktail at the Four Seasons restaurant, and just want to be seduced by noble men. The youngest daughter is not only more beautiful and more friendly, but also more serious and intelligent, with a high sensitivity to the literary arts. She is very pretty and fun so that everyone called her "Beauty"

At one point, the widower loses all things, which he possesses. Together with her three children moved into a ramshackle house in the countryside. They have nothing to do but to look out the window while remembering the fun times they have ever experienced. Beauty is always up early to help his father. Work in the fields forming the muscle and the skin becomes shiny brown. A year later, the father received word that his last ship has arrived. He went to the dock accompanied by a request from his two greedy eldest daughters to bring home expensive items some branded items such as Chanel, Gucci handbags, Godiva chocolates. Beauty is only asked for a rose.

It turned out that the goods loaded on the ship are in trouble. (The cost to take care of it drained all income.) In the condition of bankruptcy, the father intends to return home, but then lost in a blizzard. Suddenly, he saw a beautiful castle in the distance. State in the castle's looks like Martha Stewart of medieval – pile of lamb presented on silver platters, a very large-sized bed made by tiny people, riding pants that match the size he wears. In the morning, he saw not only snow but also an enormous garden with the most beautiful roses. He remerber Beaty wishes and then picked a rose for Beauty.

Suddenly, a hideous creature (the Beast) came across the park revealing his sharp teeth. Apparently, the park and its roses is the only treasure that the creature had and loved ones! The father begged to be spared, as he explained that he was a single parent. The Beast pardoned him on condition that one of his daughters have to come to the castle. The father agreed to the term and when he returned home, he told his daughters. Beauty came to the castle (after his father explains in detail how he almost lost his life when he try to get Beauty's wishes). In the castle, The Beast asks Beauty to live in the castle and provide special rooms equipped with clothing and a library. In the beginning, Beauty feels sad but eventually Beauty feel comfortable with the atmosphere in the castle. She admitted (after being forced physically), though The Beast is creepy, but when she thought of his good and kind gesture, her bad feeling fade way. The Beast is constantly asking her to marry him (an offer that she had rejected) and saying that he loves her. In the end, The Beast change request.

He only asks Beauty to stay with him for life. Beauty said that no matter how she liked living in the castle, she would not be happy if she had to live away from her father. Therefore, to make Beauty happy, The Beast let her go to the country to her father. After returning to his father's house, Beauty is daydreaming about The Beast. She was amazed at her own feelings of longing The Beast. What feeling is this? She dreamed that the Beast is in a state of dying, lying alone in his garden full roses. Beauty realized that she actually did love The Beast. She rushed back to the castle where the Beast was dying, because of his sense of longing to Beauty. Beauty goes straight into his arms and she vows that she is willing to marry him. In a second, the Beast was transformed into a handsome prince. It turned out that the prince had been condemned and transformed into an ugly creature until there is a beautiful girl who falls in love with him just because of his kindness and personality. They later married and live happily forever.

The Story Of Beauty And The Beast - Representation Of Accounting Reality And Hyperreality

Some research or articles in accounting have been used a fairy tale to provide a common understanding of information. For example, story of Cinderella was used to provide an understanding of the concept of accounting for substance over form (Hayes and Baker, NA). While Nobes (1985) as quoted by Page (2005) noted that the legend of the "Quest for the Holy Grail", is a common metaphor used by standard makers in the UK to formulate a conceptual rerangka.

The story of Beauty and the Beast can be interpreted to represent the hyperreality and reality. Beauty is described as someone who is not only beautiful, but also kind and loving, while the Beast is described as being the opposite. In the real world, is it true that there was an extreme nature - which reflected only well (good) while others reflect only bad (ugliness)? This is a hyperreality, where the symbol represents the symbol itself (not representing the facts). Just like the fairy tales in general, the story is not representing the real world, but only represents the story itself (hyperreality).

Beauty and the Beast story can also be used to represent the reality and hyperreality of accounting, for example, sales or asset purchases on credit (depending on the angle viewed of the transaction – the seller or buyer) in the concept of accrual-based accounting. First, there was the existence of a transaction that indicated the sale / purchase of credits, a transaction in which the asset swap between the seller and the buyer (in the story of Beauty and the Beast, an exchange between the roses with Beauty - herself that must live in the Castle of the Beast). Secondly, there was the recognition. The seller will debit and credit accounts receivable asset, while the buyer will debit the asset and credit debt. Here occurs a physical reality, a physical flow of assets that move from seller to buyer (in Beauty and the Beast the flow of physical reality is the rose). Third, in addition to the physical reality, there was a social reality in which the buyer happens to have a social obligation to pay any debt or there is an obligation flows from buyer to seller (in Beauty and the Beast, Beauty have to stay in the castle of the Beast). Do receivables and debts (liabilities) in fact exist? (Why does Beauty turn herself to the Beast? Is it because of obligation?) Therefore, the accounting record (journal entry) is a shadow of the factual transaction – a simulacra or

hyperreality (Macintosh et al., 2000). Finally, there was an assessment. Whether the debt will be paid by, has a value equal to the asset that is exchanged? In economics, generally value was represented by “money” (Is the rose has a value equal to the willingness of Beauty to stay at the castle?)

Baudrillarian Perspective (Order Of Simulacra)

Macintosh et al. (2000), explains that Baudrillard uses the idea of the simulacrum, implosion, and hyperreality to describe a radical development of post-modern society. A simulacrum (simulacrum) is a sign, image, model, pretence, or a shadow that resembles something like the original. Implosion is a condition in which the boundaries between two or more entities, concepts, or the fact has melted, damaged, or destroyed so that such differences are no longer visible. Hyperreality refers to the condition of postmodernity where simulacra (signs, images, or models) are not associated with fact or reality apart from the material object or romantic ideals. In ontology, the postmodern world is currently dominated by linguistic and textual constraints, which is currently more important than the economic reality that shook the era of industrialism. Baudrillard uses the concept of simulacra, implosion, and hyperreality to describe the development of signs and the reality of relationships in four levels (this does not describe the level of classification which is more important, but rather indicates that one precedes the other). Therefore, Baudrillard reveals the concept as a sign of an era or the order of simulacra. Levels of simulacra of Baudrillard area as follows: First, the sign reflects the reality that is real and that no sign precedes (profound reality). In this era, the sign refers to the appearance of real reality, in which the sign represents an honest and transparent reality. Second, the sign to hide or even distort the true nature of reality or that preceded it. In this era, the sign refers to the appearance of reality is distorted, in the sense of the sign no longer has properties like those of reality. Third, there is the absence of a sign to hide the reality. In this era, the sign, like the magic game, plays the role to create the reality. Lastly, the relation between signs and reality are exchanged or reversed, where the existence of sign occurs precedes the existence of reality. In this era, signs are not related to the reality, or even the reality itself is completely absent (hyperreality).

Order Of Simulacra And Financial Accounting

In his article of Hyperreal Finance, McGoun (1997) represents the economic-financial instrument with a game of poker. People play poker by betting tokens (cash or stock), using the token they "play the market." Players can exchange these tokens whenever he pleases, and the players enjoy the thrill of competition and the pride of having his/her token value increased. McGoun describe the level of simulacra associated with the money as follows: The first level describes the general currency symbol (image) of the property. The second stage, which is influenced by Marx Bauldrillard opinion that the "political-economy" is the transmutation of all values (labor, knowledge, social relations, culture, and nature) to the value of economic exchange. The third level, the exchange only reflects the exchange, which is justified by the exchange transactions for consumption. At the fourth level, there is no justification for the transaction. By using Bauldrillard view, at levels one, two and three, excuse or reason for the exchange of money is the “value” of money, but on the fourth level, the reason for the exchange of money is a “sign” of the money itself.

Phases or levels can be applied specifically in financial assets, such as stock prices. In the first stage, the stock price accurately represents the intrinsic value of the company. The second stage, the stock price, because of the distortions and market imperfections represent an imperfect indicator of the intrinsic value of the company. The third stage, the stock price is the only value that a company known, and the fourth stage or hiperreal stage, the stock price is only a “sign value” which is completely independent from the value of the company.

Inspired by the writings of McGoun, Macintosh et al. (2000) and Macintosh (2003) analyzed earnings using post-structuralist view. Earnings – which called “net income” by the accountants – is a sign of the

sign, and a sign it no longer represents the intrinsic income, real profit, or real income. The income as reported as an accounting net profit is only a reflection of net income itself (completely detached from reality). Macintosh (2003) used Bauldrillarian view and genealogy sign into four levels (era). The first era referred to as the feudal era; mark this feudal era of accounting in a transparent manner is a reflection of the real object. In this era, in the UK for example, rates and fines actually reflect the real object like a lamb, rice, seeds, and others, which also reflects the social relationship between the employer (lord) with the management / worker (steward). In the partnership of business, profits actually calculated from the results of a project business (venture). In other words, the profit is really divided after a business project ends. So is the capital of passive partner (Commenda), where it describes Commenda (such as members of the church or the nobility) who has participated in a secret partnership for a profit is a sign of exploitation, immorality, and dishonesty.

The second era is the era of falsehood (order of counterfeit). In this era, there was the fall of social hierarchy of feudal era and the birth of democracy. The sign is no longer dominated by hierarchical social levels, rigid, and cannot be bent, but the sign (labor and capital) can circulate freely to all parties. This new class of people (bourgeoisie) demands the freedom of rights, participation in a democracy, and the right to keep their own property. This new society can live like the life style fit for kings, feeding on a set of the best quality of china dishes. These objects represent a sign of “fraud” as false as the owner, who tried to imitate or pretend to be of the nobility (royalty). This era is the emerging signs of accounting “profits (earnings),” - which represent as the emergence of business (venture) with a permanent capital investment based on business ownership (in India in the mid 1660's). There was also an idea of the continuity of business (going concern), so the company must continue to calculate its earnings on a periodic basis. Accounting earnings represent reality that originally divided at the end of a business, but now imitated in profits as if the business is no longer exist. A sign of accounting “profit” merely reflects the “obligatory of sign” which is still associated with “real income,” income is only a reality of existence (being real).

The third era is the era of production. With the advent of the era of production in the 18th century, accounting earnings mark a radical change. In this era, which by Bauldrillard referred to as “industry of simulacra,” an era in which the production technology capable of producing artificial goods; the object is no longer a reflection, counterfeiting, or analogies of the original stuff, but just a clone of a production. Therefore, the sign is the object and the object is a sign. Social levels also experience changes characterized by the production rules, rights, and laws. Signs of accounting earnings also changed with the development corporation and the shareholder's absence. Capital has the same meaning as aggregation or collection of assets and liabilities in the company. Profit is no longer the result of a business owner, but is the result of the capital. Emerging what is known as entity that replaces the partnership (proprietary). The fourth era is the era of simulation. Realism nonmaterial signs that go beyond material economics of commodity production, consumption, and exchange mark this era. Bauldrillard suggested a new era: “... the organization of society According to simulations, codes, and replaced production models as the organizing principles of society.” A new era that is also known as hyperreality, where there are indications that the signs are no longer directly refer as a referent, or that the sign is no longer a forgery of a specific reference, or a sign does not absorb or dominate object, but purely a sign reflecting the sign itself (pure simulacra). Another term used is homo semioticus replace homo economicus. In this era, a sign of accounting “earnings” gave rise to the concept of “earnings management” refers to the smoothing of income (income smoothing) or for a certain academia as the manipulation of earnings and forecast analysis.

Macintosh (2003) concluded that many accounting symbol that does not have a clear reference to the object or real events, so that the accounting does not fully perform its functions according to the logic of representation, accountability, or the presentation of economic information in a transparent manner. Not much different from the conclusion Macintosh, Riduwan (2009), in a study of critical-postmodernist Derridean, implies that: first, the presentation of income statement should disclose earnings information in accordance with the pragmatic interpretation of the frame. Second, reporting income information not

only to favor idealism, given the end users are those who profit information in pragmatic habitus. Third, idealism should limit the application of accounting principles in the transaction and the accrual of real events, or reduce its application in the event that there is only limited to the idea or concept.

Defining Goodwill

Definition is the part that cannot be separated from the concepts of accounting, as required in the definition of the concept formation. Definition or conception of conduct could be considered acts that tend to confine (to hegemony) a person's thinking. As expressed by Antonio Gramsci (1891-1937), hegemony is a form of oppression against the way of thinking (especially thinking of oppression by the capitalist). Gramsci suggested the need for liberation from the hegemony (Santoso et al., 2007; 71-911). However, in this essay I still make the definition or conception, with the aim not to create hegemony but rather to limit the scope of writing.

Goodwill relationship with abnormal earnings based on the economic realities of corporate value, so the value of goodwill is equivalent to the capitalization of abnormal earnings stream expected to firm. Equation: $G = \left[\frac{I - (ke \times B)}{ke} \right]$ where G: goodwill; I: perpetual expected earning flow; ke: cost of equity; B: equity book value; dan $I - (ke \times B)$: abnormal earning (Zanoni, 2009; 2). Definition and concept is not different, because they provide an explanation (description) to represent something that cannot be observed directly, with the aim that "something" that makes the human mind. Therefore, to understand the same thoughts about the goodwill, it would require the definition of goodwill.

Hendriksen and Van Breda (1992, 637) stated that if a name can be assigned to intangible assets, indicating that these assets are assets that can be identified. Intangible assets such as goodwill cannot be identified. Intangible assets, although it has no substance, just like other assets, must meet the criteria for recognition of an asset; which are must be measurable and must be relevant and reliable. Should goodwill be recognized? Given that, goodwill is an example of intangible assets having a high uncertainty. It was described that goodwill may be recognized at a given time by comparing the market value of companies with net assets of the carrying amount, and if the market value is higher than its carrying value, goodwill is part of the company's assets. From this viewpoint, it is difficult to associate with the cost of goodwill or business income, so there is no point to capitalize goodwill or treated as a reduction of revenue at the time of goodwill occurs (APB 17).

Scott (2009, 231) defines goodwill as the present value of abnormal earnings in the future in relation to intangible assets. That is, a company will have goodwill if the intangible assets generate abnormal profits. Based on this definition, then the goodwill is an intangible asset arising from the internal assessment. Example of measurement of goodwill is:

The Company has a net asset value of \$240,000 and annual net income of \$60,000, and return on investment of 25%. If the normal market return is 10%, earnings \$60,000 states that the total assets worth \$600,000. The Excess return of 15% above normal returns from goodwill or any intangible assets will amount to \$ 360,000. If the intangible assets identified worth of \$240,000 then the goodwill will be \$ 120,000.

APB 16 recommends that when a business combination is considered as a purchase, the acquired assets should be recorded at fair value or the fair value of the consideration that is made in exchange. This view is consistent with the historical cost concept, which states that assets should be recorded at the time of passage if given consideration cannot be measured clearly. APB 17 also states that, if the cost of an acquired company is less than the market value / assessed value of the identifiable assets minus liabilities, the difference shall be allocated to reduce the value of non-current assets (Belkaoui, 2000). Goodwill can be recognized at any time by comparing the market value of a company with a value of net assets. Equities increased in value by recognizing goodwill. But goodwill is a benefit that cannot be specifically identified, so there is a lack of logical reasoning to associate those costs with any specific income in future periods. Treatment of assets that cannot be identified is still unclear, assets that cannot be identified do not have a semantic interpretation, and therefore not relevant so that should not be recognized as intangible assets.

Therefore, it can be concluded that goodwill is part of intangible assets as a corporate asset valuation accounts that cannot be identified. Goodwill can occur in two ways, namely the assessment of internal valuation or arise from the merger process. Goodwill arising from the internal assessment is measured by assuming that the goodwill is the discounted present value of future earnings in excess of what is expected as a normal return (abnormal return), while the goodwill of a business combination are measured by comparing the fair value and carrying value of the company's net assets.

Order Of Simulacra – Goodwill Accounting

In line with the thinking OF McGoun (1997), Macintosh et al. (2000), and Macintosh (2003), I try to analyze the accounting of goodwill by using the perspective of postmodernism Baudrillardian. I propose the order of simulacra of goodwill as follows:

Era Of Proprietary: The first era is the era of proprietary, in which a sign, symbol, or image reflects the owner's property. Proprietorship term originally appeared in the attempt to put on an exposition of the logic of double-entry (double-entry bookkeeping). In accounting, the equation is: $\sum A - \sum L = P$, where the proprietor (owner) is the center of interest. Assumed assets and liabilities owned by the proprietor is the proprietor liability, so the net value of the proprietorship is a business proprietor (Hendriksen and Van Breda, 1992, 770). When a business starts, the company's value equals the value of the initial investment of the owner. With the passage of the business, this value will change to the initial value plus the accumulated investment earnings and will be reduced by the net loss or withdrawal by the owner. This becomes the concept of wealth. Thus, in this era, theory of proprietary is a logical partnership framework under the law and and most appropriate be applied to a single union (single proprietorship). In this era, business is still a venture, as narrated in the Beauty and the Beast: Beauty's father business is limited to one ship route trip. In my opinion, goodwill has not yet emerged, because the owners are only concerned for his own fortune.

In addition, the form of business combination is still not widely known. Even if there is no assessment or company business combination, goodwill is more suitable recognized as a reduction of income or as expenses that will form the property owner (Hendriksen and Van Breda, 1992; 637). The reason given by Hendriksen and Van Breda is to recognize and assess the fair value of goodwill by comparing the company with net assets of the carrying amount is difficult. How we determine that the value of the company represents the fair value of real world if the company does not actually being liquidated? As expressed by Macintosh (2003), in this era, business is still dominated by individual businesses, so individual company sets the value. Takeover of an individual business by another will depend on its owner, as the owner determines how wealth he has.

Era Of Production (*Political-Economy*)

The second era is the era of political economy, where there are various interests that tried to be served by the reporting of goodwill accounting. McGoun (1997) revealed that in the era of “political-economy” there was a transmutation of all values (labor, knowledge, social relations, culture, and nature) to the value of economic exchange. In an era of booming capitalism, there were many efforts in the development area, including efforts to replace individual owners (proprietary) to the mass production. Which in turn makes the difference of interest among the stakeholders of the company became increasingly sharp. Various theories of accounting that is based on economic theory emerged in this era to explain accounting practices. These theories include dynamic capabilities theory, enterprise management theory (enterprise equilibrium theory), which became the basis of valuation of internal goodwill. The theory of capital, in which the economic shift from an agricultural economy to trade, and eventually became the industry economy, making the capital as a factor of production, which eventually resulted in a shift towards intangible dimension, social, and dynamic. Zanoni (2009: xii) provide examples such as theories of human capital theory (Schultz 1961, Becker 1962), social capital (Bourdieu 1980, Coleman

1988), and intellectual capital (Grindley and Teece 1997, Dzinkowsky 2000), which seeks to explain that the value company may be caused by the human resource excellence, social, and intellectual property.

These theories cannot be separated from the emergence of a Political Economy of Accounting (PEA) paradigm. PEA asserts that accounting (practice and research) should be analyzed through three approaches, namely the normative, descriptive, and critical (Cooper and Sherer, 1984). Normative approach emphasizes the normative elements and an assessment of the social. That is, accounting is identified and evaluated with variety of paradigms. The political and social values influence the choices of accounting. Descriptive approach emphasizes that accounting is a practical thing. It is influenced by the behavior of individuals and classes that exist within or outside the organization. As to better understand, the accounting practices need to be a descriptive approach. Critical approach emphasizes critical awareness to develop and evaluate alternative paradigms and methods that combine a variety of accounting interests.

Although there has been a shift in accounting, accounting goodwill still insists on the principle of historical value. Example of Accounting Goodwill - Historical Cost Accounting is as follows:

“P companies pay for Rp87.000.000, - to acquire the S company's voting stock outstanding at the date of January 1, 2011 when the company's shareholders' equity consists of share capital of Rp60.000.000, - and retained earnings amounting to 30,000,000, - Calculation of goodwill company is recognized for Rp15.000.000, - {Rp87.000.000 - (Rp90.000.000 x 80%).”

Goodwill calculation shows that the company's P (parent) recognizes the S company's net worth only 80% of the value of its subsidiaries.

Based on historical accounting concepts, I argue that in this era, goodwill valuation approach is done by the Income Statement approach. Measurement and valuation of goodwill is mainly aimed to make the allocation of the historical value of the company, either by technique of amortization of assets or by technique of impairment of goodwill. As revealed by Riduwan (2009) that earnings do not represent reality. A sign of accounting “profit” merely reflects the “obligatory of sign” which is still associated with “real income,” income is only a reality of existence (being real). Therefore, the sign of goodwill is also just a reality of existence or being real.

Era Of Globalization: The third era is the era of globalization, where accounting attempted to be globally standardized with the implementation of International Financial Reporting Standards (IFRS). Here are the reasons why Indonesia adopts IFRS as stated by the Chairman of the National Board of IAI (Indonesian Accounting Institute), Ahmadi Hadibroto:

IFRS is a strategic step toward uniformity of “language” in the accounting and financial reporting as the main agenda of the global accounting profession. The creation of global harmonization of accounting standards is also one of the objectives and commitments of the G-20 in enhancing the cooperation of the world economy. Global standards enable the comparability and exchange of information. IFRS convergence may enhance the information of the financial statements of companies in Indonesia. Adoption of international standards is also very important in order to stabilize the economy. The benefits of IFRS convergence program is expected to reduce investment barriers, improve corporate transparency, reducing costs associated with the preparation of financial statements, and reduce the cost of capital. The goal of financial statements prepared by the IFRSs will only require a bit of reconciliation to produce financial statements.

The interesting part about the statement is the uniformity of language, economic stability, and benefits of IFRS adoption. From here, it seems that adoption of IFRS did not see the factual reality of the situation and conditions in Indonesia, but rather look at globalization simulacra (is it possible that many countries with its cultural, community, social interaction, legal, and others be made uniform?) Research of implementation of IFRS in Indonesia (Chariri and Hendro 2010; Wahyuni and Lay 2010; Budiono 2008)

provide evidence that IFRS is suitable in Indonesia. Unfortunately, there is no research about whether harmonization or adoption of IFRS is in accordance with local cultural and spiritual values in Indonesia. There is also no research evidence that could prove that Indonesia is necessary to adopt IFRS (the reality of Indonesia). The main principle of the background for IFRS is a principle of comparability and uniformity with emphasis on the approach to fair value (fair value accounting). Todd Johnson, a FASB staff expressed (2005, as quoted by Ball 2005):

“The Board has required greater use of fair value measurements in financial statements because it perceives that information as more relevant to investors and creditors than historical cost information. Such measures better reflect the present financial state of reporting entities and better facilitate assessing their past performance and future prospects. In that regard, the Board does not accept the view that reliability should outweigh relevance for financial statement measures.”

Accounting for goodwill is mainly set in conjunction with the acquisition of companies or businesses combination (IFRS 3 and IAS 36):

All business combinations are accounted for by applying the purchase method, requiring that one entity is identified as acquirer (IFRS3.17). The difference between the cost of the business combination and the fair value of the assets and liabilities acquired represents goodwill (IFRS 3.51). Goodwill is not subject to amortisation, but is assessed for impairment at least annually (IFRS3.54 and IAS36.10). Impairment is charged to the income statement (IAS36.60).

Examples of goodwill according to IFRS accounting (fair value accounting):

P companies pay for Rp87.000.000, - to acquire the company's voting stock outstanding at the date of January 1, 2011 when the company's shareholders' equity consists of share capital of Rp60.000.000, - and retained earnings amounting to 30,000,000, - Calculation of goodwill company is recognized for Rp18.750.000, - $\{ (Rp87.000.000/80\%) - Rp90.000.000 \}$.

Goodwill calculation shows that the company's P (parent) recognizes the company's net worth (the subsidiary) at 100% of the value of its subsidiaries. With this calculation, the value of goodwill will be larger than the measurement of goodwill in the previous era (Rp15.000.000). This makes the company's assets to be larger and the potential impairment of goodwill will significantly would reduce corporate profits. At this time, the entity theory is emphasized in the new corporate entity, although in reality (legally) the new entity does not exist. Based on the new entity theory and principles of relevance, I argue that accounting goodwill in this era of emphasis on the balance sheet approach, in which the accountant seeks to provide information about the company's assets at balance sheet date (not the historical value of the property companies). It appears that in this era, the object (goodwill) is no longer a reflection, counterfeiting, or analogies of the original item, but only an imitation of a mass production (global).

Era of Virtualality: Lastly, the fourth era is the virtual era, where the boundaries of the world and social communities have disappeared altogether. Forms of companies in the future no longer looks real (mortal and brick) but rather in virtual form (form of company in cyberspace). Information and communication technology revolution has eliminated national borders, time and space to interact and communicate with each other to form a global community. Technological development has also brought a lot of change, especially in transaction activity. Flow of goods and services not only through the customs area from one country to another, but also through electronic transfer (virtual). Consumers can purchase goods easily through the internet, and in a short time to hand the goods. Trading in the virtual world known as e-commerce has the potential to be one of the largest wheel drive economic development in the future.

In addition, the traffic cash payments as an instrument to assess the transaction will also undergo radical change. Money no longer seem real (paper form), but transformed into another form of the electronic money (e-money). E-money can be formed as card-based product and softwarebased product

(Suryaningrum, 2010). E-money in the form of card-based products are often referred to as electronic purses, which are principally intended for direct payment (face to face). While software-based product is often, called digital cash, in principle, is an application (software) is installed into a Personal Computer (PC) that runs with the standard operating system that was developed to conduct transactions via a computer network (internet). Example of card-based product that already exists today is the Octopus Card, Visa Cash, MONDEX, Proton and others. While the examples of software-based product in several countries, among others, Kleline (France), e-cash (Switzerland), Barclaycoin (UK), CyberCoin (USA) and others. E-money products based software is still relatively little used. Mechanical technique that is used to manipulate the data of “value of money” is balance-based techniques. The concept is to apply the principles used in bookkeeping process in which each transaction shall be treated as the debit or credit which would then affect the outstanding (balance) contained in the e-money.

In this era, simulation occurs, there are indications that the signs are no longer directly refer to a reference (referent), or that the sign is no longer a forgery of a specific reference, or sign does not absorb or dominate an object, but purely a sign reflecting the sign itself (pure simulacra). The Company is no longer a referent of the company, and money is no longer the referent of money. As a result, the value of goodwill as a form of company will be very difficult to be measured and assessed considering the company itself exists only in cyberspace (virtual). Thus, the important question is: is it still necessary to have the accounting of goodwill in the future?

CONCLUSION

Fairy tales have been used by accounting researchers to provide a common understanding of information. For example, Cinderella story that used to provide an understanding of the concept of accounting for substance over form (Hayes and Baker, NA). Nobes (1985) as quoted by Page (2005) noted that the legend of the “Quest for the Holy Grail,” is a common metaphor used by standard makers in the UK to formulate a conceptual framework. Search of “Holy Grail” implies there is more than just searching for something that is hard to find. The search process itself, which gives the meaning of which contains a value. In this essay, I did a metaphor of the story of Beauty and the Beast for a better understanding of hyperreality and reality in accounting. Metaphor is needed primarily to understand something that in reality does not exist, but can be inserted through the human mind.

On the study of accounting goodwill, I use the perspective Baudrillardian order of simulacra: 1) the era of ownership (proprietorship), 2) the era of production (political economy), 3) the era of globalization, and 4) the virtual era. Review of goodwill accounting in this essay is limited to literature study and my own interpretation, so it needs further study with a variety of paradigms such as Interpretive, critical, or postmodernists. Qualitative research is appropriate to be used, since it dig deeper into the meaning of goodwill by the parties related to the company (stakeholders), not only investors, shareholders, auditors, and governments, but also the management accountant, accountants educators, or other parties. Besides that, it seems necessary to answer the question “is information of goodwill useful for decision maker?” This study is important given that the accounts valuation of goodwill as companies often take a large portion of assets in a merger transaction, so the decline in value of goodwill is significantly affecting the decline in corporate profits. Although there is no reality in valuation of goodwill for company’s accounts (hyperreality), but it has the ability to influence the real thing itself.

“Every journey into the past is complicated by delusions, false memories, and false naming of the real events” (Adrienne Rich)

AMENITY CONFLICTS BETWEEN URBAN PORT FACILITIES AND COMMUNITIES IN AUSTRALIA

Gary F. Keller, Cardinal Stritch University

ABSTRACT

Selsky and Memon (1997) commented that ports are part of a zone “where there is considerable pressure from diverse stakeholders” due to technological, economic, political and environmental forces from stakeholders as well as from “the wider context management of urban ports.” They referred to three forms of community conflicts around urban ports: locational conflicts; failures of corporate social responsibility; and inadequate co-management arrangements. The author analyzed the sources of conflict identified in national surveys of Australian ports from 1999 to 2010 to evaluate the significance of these matters as possible interferences in what Memon and Selsky describe as the “amenity commons.” An analysis of the Australian Report Cards from 1999-2010 strongly indicates that a direct correlation exists between the economic utility and efficient management of ports and the resulting impact those processes have on their urban neighborhoods and extended communities. The salient discovery is that the issues raised by Menon and Selsky and verified in the Australian Infrastructure Reports mandate the need for improved strategic planning for a reasonable solution for ports and their surrounding communities in the second decade of the 21st century.

KEYWORDS: Port management Urban/port infrastructure growth issues Port/local community conflicts Economic and environmental sustainability challenges

INTRODUCTION

The purpose of this study was to survey the experience of Australian ports and their adjacent urban communities over the period 1999-2010 to categorize the issues that have affected the amenity commons and the degree to which *interspecific competition* has ensued. The source of data for this section is the series of *Infrastructure Report Cards* produced by Engineers Australia from 1999 to 2010. The ports and transshipment points from Australia’s rich natural resources zones are via its ports. As the Australian economy improved in relationship to the take off period of the Chinese and Indian economies so has the strain on its ports to handle efficiently the egress of exports and ingress of imports. Simultaneous with the demands on the ports for increasing their capacity and efficiency are the natural by-products of commodity/industrial enterprise, pollution of all sorts, congestion, potential for biological contamination and human terrorism and the economic stress of competition for valuable real estate. Selsky and Memon identified these tensions as *amenities commons conflicts* in 1996-’97. Data from the Australian Report Cards from 1999-2010 strongly indicates that a direct correlation exists between the economic utility and efficient management of ports and the resulting impact those processes have on their urban neighborhoods and extended communities. The resolution of these common conflicts was articulated by Selsky and Memon in 1997 (holistic approach) and the 2010 Australian Infrastructure Report Card (harmonize).

LITERATURE REVIEW

The significance and value of worldwide maritime trade along with the associated shipping industry and port facilities infrastructure is colossal. It is estimated that 90% of world commerce is carried by commercial vessels (Marisec, 2011) and the global maritime transportation industry generated an estimated annual income of (USD) \$380 billion (Korinek & Sourdin, 2009). According to the World

Bank, the total value of the international shipping industry expressed in terms of GDP would rank it 25th in the world, slightly ahead of Saudi Arabia (World Bank, 2009).

Australia's economic development and concomitant regional geopolitical influence is dependent on its port facilities as a base to export its diverse portfolio of strategic raw materials, not to mention the volume of goods imported by Australia. Australia is the home of nearly six (5%) of the world's largest ports in terms of freight tons handled (Hedland #19, Dampier #26, Newcastle #39, Hay Point, #46, Gladstone #52, Brisbane #122) and 2 (1.6%) of the world's top container ports (Melbourne #51 and Sydney Ports #67) (American Association of Port Authorities, 2011). These statistics shed light on the economic, social and domestic political importance that port facilities have on Australia. However, lost in the macro analysis of global maritime trade and the value of port infrastructure are the micro frictions described by Selsky and Memon (1997) as *amenity commons conflicts*.

The evolution of contemporary port locations in virtually any country can be traced to sites with access to navigable waters. At these locations, commerce and communications with others could be easily and efficiently conducted. Generally, ports were created first followed by settlements around them and eventually expansion of the urban port communities was facilitated by the economic activity tied directly to or spun off by port business. Economists refer to the advantage that the local economy derives from the geographic location of a port as an endowed asset/advantage. Australia's early port settlements became the basis of and continue to account for the greatest population concentrations along its coasts; particularly the three largest population centers Sydney Brisbane, Melbourne and Brisbane that are the homes of three of the largest port facilities in Australia.

During the *take off* period of many countries during the modern industrial era, the consideration of quality of life issues were rarely if ever considered. The major metric of progress was economic growth. The cost of economic progress in terms of the cost of degradation of the environment was not considered as salient. However, recently threats to human health due to industrial pollution, threat of environmental disasters such as oil spills and ship wrecks may have on sensitive environmental assets such as the Great Barrier Reef, the release of hazardous materials, storage of potentially lethal cargoes and threats of variety of forms of terrorism have become common community concerns.

One of the more contemporary studies conducted of Australia's coastal zone was a major investigation done from 1991-1993 by the Resource Assessment Commission and another study, the Commonwealth Coastal Policy, 1995. Both reports focused on the impact of shipping based pollution (ship-sourced pollution and ballast water issues) and little attention was given to the difficulties caused by port operations (Bateman, 1996). Another paper, The Australian and New Zealand Environment and Conservation Council (ANZECC) Discussion Paper on Maritime Accidents and Pollution articulated one of the key reasons for the development and existence of what would be called *amenity commons conflicts* as the lack of an aligned approach to deal with overarching issues posed by the maritime industry and other interests. Bateman (1996) observed, "There are no institutions or mechanisms in place at present in Australia to resolve differences of this nature or to define national priorities with national maritime interests and activities" (p. 230). Selsky and Memon (1997) placed the issues cited in the Resource Assessment Commission, the Commonwealth Coastal Policy and the Australian and New Zealand Environment and Conservation Council (ANZECC) Discussion Paper on Maritime Accidents and Pollution and increasing trend toward the privatization of port management in a new context. Unlike the official reports, which Bateman claimed, only outlined factors that contributed to conflict between ports, the maritime industry and urban communities but did not propose a methodology to mitigate the issues, Selsky and Memon asserted that a *holistic* approach was needed. To accomplish that objective Selsky and Memon created several useful definitions to guide an analysis. First, they characterized ports as "part of a zone where there is considerable pressure from diverse stakeholders" (p. 259). Second, the authors maintained, "many community conflicts over development are concerned with amenity values such as

quiet, ambiance, scenic views and lack of congestion” (p. 261). Third, they defined the core port/community disagreements as:

Locational conflicts, that is, opposition by some interests in a community to corporate development initiatives. Alternatively, such conflicts may be seen as failures of corporate social responsibility, in which the dominant corporate actor does not fulfil social expectations placed on it. Finally such conflicts may be seen as the result of inadequate comanagement arrangements in a common pool resource (Memon & Selsky, 1998, p. 589).

Finally, Selsky and Memon (1997) defined the underlying source of disagreement of common pool co-management as *amenity commons conflicts*.

From the perspective of commons co-management, amenity values may be considered common-pool resources, and conflicts over such resources indicate inadequate institutional arrangements for managing them. The eruption of conflicts over disamenities can make transparent that residents assume property rights to amenity values in their community. The reason for the conflicts is that the residents feel those rights have been violated. We may call this bundle of de facto rights an amenity commons (p. 261).

In 1998, Selsky and Memon released their case study analysis of Otago Harbour in New Zealand (*Institutional Design for the Comanagement of an Urban Harbor in New Zealand*) that applied their innovative approach to revealing *amenity commons conflicts* and proposing solutions. Their case study of Otago Harbour was an innovative approach to thoroughly examining the historical divergence between the port company and the local community. The case study not only examined the causes of *amenity commons conflicts* but also offered a blueprint for the resolution of these negative interfaces for other port communities to follow.

METHODOLOGY

Data

The data used by the Institution of Engineers, Australia (IEAust) to evaluate the condition of Australia's key infrastructure segments from 1999 to 2010 was the basis of this study. Data was obtained from research and interviews with appropriate community and business groups and publicly available information. The methodology employed by the Institution of Engineers, Australia assesses ports as the equivalent of a structure (bridge, highway) or system (water/waste water); however, inevitably the reports briefly and in general terms mention *amenity commons conflicts*.

In the 1999, Infrastructure Report the IEAust stated that the results of the Infrastructure Report were comparable to an American project completed in 1998 in which grades (A-F) were used to articulate the condition of America's infrastructure. By following the American grading system, the IEAust was able to provide a consistent context for the evaluation of Australia's infrastructure. The methodology used to evaluate the data was a mixed method approach. The assessments relied on publicly available information and concentrated on strategic issues, augmented by quantitative performance measures if they were easily obtainable. After the data was accumulated and analyzed, qualitative grades were issued. The grades of A (very good) to F (inadequate) signified an average over a number of criteria, including adequacy, need, funding, condition, performance, and social and environmental issues.

RESULTS AND DISCUSSIONS

The Institution of Engineers, Australia (IEAust), the largest professional body representing Australia's engineers, responded to a variety of high profile infrastructure failures in Australia by issuing periodic

reports on the status of Australia's infrastructure (see Table 1 for summary of *Australian Infrastructure Report Cards*).

Table 1: Summary of Australian Infrastructure Report Cards

Year	Location	Conflict/Difficulty	Rating
Australian IR 1999	National	No evaluation of ports in 1999 Report.	N/A
Australian IR 2001	National	Increasing urban encroachment around port sites is limiting their expansion capacity and affecting residential amenity. Strong need for integrated planning in relation to maintaining buffers around ports and controlling the urban development of land adjoining ports.	B
New South Wales 2003	Regional	Ports not included in report.	
Queensland IR 2004	Regional	Residential development and port operations with noise and lighting tend not to co-exist comfortably.	B-
Australian IR 2005	National	Urban encroachment. Co-ordination with land and air transport systems. Channel deepening is required for the Port of Melbourne to meet future growth in the size of ships. Current and continuing boom in the minerals sector in W. Australia, particularly those industries at the Burrup Peninsula will necessitate continued upgrading and provision of facilities.	C+
Aus. Cap. Territories IR 2005	Regional	No evaluation of ports in Infrastructure Report Card.	N/A
Northern Territories IR 2005	Regional	Barge landings and port facilities all appear to be of an adequate standard for the Northern Territories. Urban encroachment issues in several ports noted.	B+
South Australia IR 2005	Regional	Ports not included in report.	N/A
Tasmanian IR 2005	Regional	Urban encroachment and protection of land zonings and access corridors.	B
Victorian IR 2005	Regional	For all ports, urban encroachment and protection of buffer zones and access corridors.	C
Western Aus. IR 2005	Regional	For all ports, urban encroachment and protection of buffer zones and access corridors.	B-
Australia IR 2010	National	The need to consider future port requirements when making nearby urban development decisions is essential.	B-

Table 1 is a summary of the key findings from the Institution of Engineers, Australia (IEAust) reports that evaluated the condition of Australia's key infrastructure segments from 1999 to 2010. The methodology used to evaluate the data was a mixed method approach. The IEAust evaluations relied on publicly available information supplemented by quantitative performance measures if they were easily obtainable. After the data was analyzed, qualitative grades were A (very good) to F (inadequate) issued. The appearance of urban/port facility conflict first appeared in 2001 and became a significant component of the national (and most regional) IEAust Infrastructure Reports thereafter.

1999 Report: Their first report issued in 1999 examined and graded (A = excellent, F = inadequate) the following infrastructure sectors: national roads, state roads, local roads, bridges, railways, water, sewerage, management and planning and benchmarking (Institution of Engineers, Australia (1999)). Curiously, ports were not analyzed or assessed in the IEAust's first infrastructure report.

2001 Report: The IEAust's 2001 Infrastructure Report Card expanded the infrastructure sectors that were graded using the same A – F scale as in 1999. The sectors that were analyzed expanded from 9 in 1999 to 13. Seven new sectors were added: Electricity, Airports, Gas, Telecommunications, Ports, and Storm Water. Deleted were management, planning, and benchmarking (Institution of Engineers, Australia, 2001). In this report, the highest ranked infrastructure sectors were Ports (B), Telecommunications (B) and Airports (B). A B grade was interpreted to mean that "Minor changes required in one or more of the infrastructure condition, committed investment, regulatory regime and planning processes to enable infrastructure to be fit for its current and anticipated purpose" (IEAust, 2001 Infrastructure Report Card, p. 98). The chief issue articulated in the summary portion of the 2001, Infrastructure Report Card was "Increasing urban encroachment around port sites is limiting their expansion capacity and affecting residential amenity. Overall the infrastructure is currently rated as acceptable to very good overall" (p. 4). The IEAust concluded their analysis with the following recommendation:

Better integration of intermodal transport is required to remove bottlenecks and improve the efficiency of freight movement from wharf to road, rail and air networks. There is a strong need for integrated planning in relation to maintaining buffers around ports and controlling the

urban development of previous port owned or port related lands. This urbanisation creates many of the community problems facing ports. Whilst this is particularly pertinent in capital cities, it is also becoming an increasingly important issue in regional ports and new remote area ports. Further work on developing suitable pricing and investment criteria is necessary, in the absence of competitive market forces, to ensure sound investment; dividend and pricing decisions are made by port corporations and their owners (p. 39).

The 2001 Infrastructure Report was a seminal and sobering statement of the existence (to use the biological terms) of the existence of a *mutualistic relationship* and *interspecific competition* between ports and their urban hosts. A *mutualistic relationship* is characterized by a two-way interface in which each party derives value from the other. While the connection between the economic benefits spun off by a vibrant port to its surrounding urban host is obvious, the 2005 Report Card suggests the existence of a parallel and potentially harmful rivalry between ports and their urban communities, *interspecific competition*. The nature and outcome of such a rivalry is both the ports and bordering urban communities, experience reduced benefits due mutual competition for the same resources (land, air, hours of operation, and the other factors referred to by Selsky and Memon and the IEAust as amenities). While some may assert that *interspecific competition* is the price to be paid for economic opportunity, the IEAust 2005 Report appears to have assessed the health of the ports as economic infrastructure assets while simultaneously balancing the advantages of the ports with the twin costs of the deterioration of the quality of *urban commons amenities* and reconciling the *interspecific competition* due to alterations in port management and co-management issues with the local government.

2005 Report: The grade assigned by the IEAust to the state of Australian ports in the 2005 Australian Infrastructure Report Card declined from a B (good) in 2001 to a C+ (adequate) in 2005. The main concern and reason for the decay in the evaluation was due to “urban encroachment, which limits a port’s ability to expand, as well as co-ordination with land and air transport systems” (p. 6). Other concerns cited were channel deepening for the ports of Melbourne and Fremantle and concerns with the process by which investments were made by port management to secure guaranteed economic returns, and the lengthy process to secure permits for strategic developments (p. 7).

Taken at face value, the 2005 Report Card attributed the potential curtailment of Australia’s economic growth to *urban encroachment* (2005 Report Card) rather than continuing the balanced theme noted balancing growth with *residential amenity* (2001 Report Card) underlines the inherent *interspecific competition* when commerce and community interests cohabitate. The only mention relating to urban amenities was alluded to in the Sustainability section. The 2005 Report Card divided sustainability into environmental, social and economic. Social and economic sustainability were defined as: outcomes includes reducing commuter times, increasing road safety, improving air quality and providing access to broadband communication to all citizens. Economic sustainability means ensuring that we have taxation and regulatory systems that promote new private sector investment in all infrastructure capable of generating adequate returns on investment. Most infrastructure organisations now incorporate sustainability objectives into their plans. (pp. 6-7) The 2005 Report Card advocates firmly for the economic needs of ports rather than a balanced approach noted in the 2001 Report Card. Economic pressures appear to be the primary motivation given Australia’s role in fueling raw materials into the surging Chinese and Indian economies during this period. Therefore, the balance between development of port infrastructure and urban amenities shifted in favor of port management.

2010 Report: Ports received a higher grade (B-) in the 2010 Australian Infrastructure Report Card than the 2005 report. While the half grade increase was still below the 1999 Report Card grade, progress was noted in several areas. The 2010 Report Card also provided more detailed information about individual ports than previous studies. From a strategic perspective, the 2010 Report Card made several important recommendations to reduce *interspecific competition* between economic interests and local governments specifically:

*Harmonise infrastructure planning and regulation through improved cooperation and collaboration between all levels of government, business and the community.
Establish independent planning infrastructure advisory groups to provide advice on infrastructure priorities and provide infrastructure planning and funding advice. (iii)*

The overarching issue discussed in the 2010 Report Card regarding ports centered on “meeting future container growth...which could only...be accommodated by developments underway at many ports that are providing additional stevedoring capacity and infrastructure upgrades” (p. 25). The problem with this growth for the surrounding urban areas is “more congestion, delays and pollution as a result of the huge traffic movements and this will be untenable from the perspective of the exporters and importers, and the community” (p. 26). The 2010 Report Card altered its focus regarding the *urban encroachment/urban amenities* issue from *interspecific competition* (2005) to *mutualistic relationship* (2010). The need for investment in Australia’s ports to expand and maximize their capacity and efficiency was apparent and urgent; however, the IEAust opined that:

These projects need to be funded and implemented to enable ports to cope with future growth in an economic, social and environmentally sustainable fashion. Integrating land use decisions with port development is a major problem for many major ports. Ports require large amounts of land and generate significant road and rail traffic. Ensuring compatible land use around ports is challenging due to the typically high value of land around ports. The need to consider future port requirements when making nearby urban development decisions is essential. Local governments need to consider the port’s future requirements and ports need to better contribute to local and regional planning. Urban encroachment and other developments should not prevent the efficient functioning of the port. (p. 26)

In sum, the recommendations of the 2010 Report Card summarized the key issues noted by Selsky and Memon (1997). Table 2 depicts Selsky and Memon definitions of issues that led to *amenity commons conflicts* and the major problems in Australian ports and their urban neighbors that are contributing to infrastructure weaknesses resulting in the sub-optimization of the Australian economy.

Table 2: Comparison of Selsky and Memon Definitions and 2010 Report Card Recommendations

Definition	Selsky & Memon	2010 Report Card
Mitigation	Holistic approach to solve inadequate co-management arrangements	Harmonize planning and regulation via improved collaboration between all levels of gov., business and community
Ports	Zone of considerable pressure from diverse stakeholders	Vital component of economic infrastructure
Nature of Conflict	Amenity values	Urban encroachment and development should not prevent efficient functioning of port
Disagreements and Consequences	Locational conflicts due to corporate development initiatives	Congestion, delays and pollution

Table 2 compares Selsky and Memon’s (1997) definitions of amenities commons conflicts and connects them with the most recent IEAust Infrastructure Report (2010) to show their practical application. It is clear that theory provided a rigorous predictor of outcomes indicating a growing debate between quality of life and economic development issues.

CONCLUSION

The purpose of this paper was to analyze the sources of conflict identified in a national survey of Australian ports from 1999 to 2010, which includes the expansion of port infrastructure issues; residential encroachment and environmental sustainability issues; and to evaluate the significance of these matters as possible interference in what Memon and Selsky describe as the “amenity commons.” The source of data for the research was a series of *Infrastructure Report Cards* produced by Engineers Australia from 1999 to 2010. An analysis of the Australian Report Cards from 1999-2010 strongly indicates that a direct correlation exists between the economic utility and efficient management of ports and the resulting impact those processes have on their urban neighborhoods and extended communities. The resolution of these

common conflicts was articulated by Selsky and Memon in 1997 (holistic approach) and the 2010 Australian Infrastructure Report Card (harmonize). The salient discovery is that the issues raised by Menon and Selsky and verified in the Australian Infrastructure Reports mandate the need for improved strategic planning for a reasonable solution for ports and their surrounding communities in the second decade of the 21st century.

Limitations: There were several limitations to this research. The issues explored by Memon and Selsky extend beyond the scope of this paper and would include other types of “port” facilities, most evident are airports. Whenever the creation of or expansion of a “port” facility occurs, the economic considerations generally emerge as the primary motivating force for action. Therefore a need exists for communities to create and engage in long-term planning to avoid the inevitable consequences of the “build it and they will come...now what are we to do” mind model that currently plagues nearly every urban major port facility. Additionally as governments around the world continue to spin off public infrastructure to the private sector, the inevitable cleavage between economic asset maximization and quality of life issues for the surrounding community may continue to widen. A need exists to harmonize the symbiotic relationship between the goals of two equal and seemingly contradictory parties.

Further Research: Further research is needed to determine how other countries with a robust maritime industry deal with amenities commons issues. One suggestion is seek out how port facility strategic planning includes key stakeholders into the process. A model-building template may be another technique to research and/or create to allow a reasonable state of equilibrium to exist considering the substantial amount of public funds needed to operate a contemporary port. Incorporating the long-term view regarding port planning/community development is especially vital to developing countries, as the actions taken to stimulate their economies via global trade will inevitably have an impact on the communities that emerge to support the ports.

WHAT?! A PENALTY FOR UNDERPAYMENT OF ESTIMATED TAXES: A CASE STUDY ON ESTIMATED TAXES

Cathalene R. Bowler, Morgan State University

Nathan K. Austin, Morgan State University

Ira W. Bates, Florida A&M University

ABSTRACT

The IRS annually collects well over \$870 million in estimated tax penalties (Wells, 2006). Therefore, it is imperative that students understand the concepts of estimated taxes and how they are determined. The purpose of this case is to provide accounting/tax undergraduate students with an opportunity to use a real world case to apply textbook knowledge on estimated taxes. This case enables students to learn how to determine if estimated tax payments are required, how to calculate the quarterly payments, and how to calculate the estimated tax penalty. An essential part of this case provides students an opportunity to discuss alternatives (i.e. increase withholdings, make the estimated payments, or invest the funds). This is a short teaching case that is primarily application based and can be completed in a 50-minute class session. This case is based on a real business owner and his accountant; the names (businesses, individuals, and locations) have been disguised for privacy purposes.

JEL: H25, M40

KEYWORDS: Estimated taxes, estimated payments, tax penalty

INTRODUCTION

In May 2004, Romeo Smarts, owner of R & G Mortgage, Inc., agonizes over his financial situation; the housing market was steadily declining, causing his mortgage business to take a big hit. His net pay was barely enough to maintain their standard of living. So after discussing the situation with his wife, Gigi, they decided to reduce their withholdings. However, Gigi was concerned so she asked him, “Does this mean we will owe this year?” Romeo dauntingly responded, “Hopefully not, if the housing market doesn’t make a turnaround soon, we may have a loss. I’ll talk to our accountant, Kester Lang, about it when he prepares our taxes for the year.”

ISSUES WITH ESTIMATED TAXES

Many business owners are paying large sums of estimated taxes each year. The IRS annually collects well over \$870 million in estimated tax penalties (Wells, 2006). In an article of the Wall Street Journal, Mel Schwarz commented, “Hard times and tight credit may tempt some people to borrow from the government by knowingly underpaying their estimated taxes. Since the “penalty for underpayment is nondeductible interest charge on the amount of underpayment, this may be a cheaper alternative for many taxpayers.” Anyone who tries it should make sure he or she knows where to get the money to catch up on taxes and interest due April 15. Failure will produce more penalties on top of the interest charge” (as cited in Dale, 2009).

BACKGROUND ON THE COMPANY

Romeo Smarts worked full time at a local bank to support his wife Gigi and three kids. In 1989, Romeo decided to take up some side work, so he became a financial services entrepreneur with ABC Financial,

Inc. (ABCF). The firm sold life insurance, mutual funds and began to issue mortgages in 1993. Romeo received his license as a mortgage broker in June 1994. After unsuccessfully submitting several mortgage loans for approval to ABCF, Romeo decided to go on his own in order to work with other banks. He officially started his own business in 1995 as R & G Mortgage (an S-corporation) in Sarasota, FL. Each month the profits increased, starting at \$14,000 the first month to a maximum of \$55,000 in later months. He averaged about \$350,000 the first year. After a while, Romeo had to rent an office and hire employees. He later convinced his wife Gigi to join him to manage the administration office. Seeing the success of his business, he quit his full time job at the bank to fully focused on his business. In addition to the mortgage business, he invested in rental property, other investments, and ran another small business (sole-proprietorship) for a year or so. He later opened two R & G Mortgage branches, one in Athens, GA and another in Columbia, SC. The business was growing so fast, to a point where he was averaging \$750,000 a year.

FINANCIAL/TAX CONCERNS

The rapid growth of R & G Mortgage, Inc. caused Romeo to be concerned with the tax consequences, so he hired Kester Lang of KL Accounting to prepare his taxes. Romeo paid himself as an employee, so he had federal withholdings taken from his and Gigi's paychecks. His S-Corporation income was reported on his personal tax return, which he filed jointly with Gigi. Each year they received a refund from their tax returns. However, in 2004, the housing market began to decline causing business to be slow. Romeo decided to reduce the amount of his and Gigi's withholdings in order to increase their net pay. Unfortunately, there was a tax consequence for reducing the amount of withholding.

MEETING WITH ACCOUNTANT

Now in his tenth year in the mortgage business, Romeo arrives at KL Accounting to pick up his 2004 tax return (See tax information in **Exhibit 1**).

Kester: "Hello Romeo. Unfortunately I have bad news for you; you will not be receiving a refund this year, you actually owe this time."

Romeo: "Well I expected that, since I reduced our withholdings, we needed to increase our net pay this year due to the decline housing market; I'm actually surprised that we don't have a loss. So what's the damage?"

Kester: "Well, you owe a little over \$2900, but you also owe a penalty."

Romeo: "Penalty?! I owe a Penalty for what?!"

Kester: "Well Romeo, that's a question many business owners tend to ask when they have a large balance due at the end of the tax year. Believe or not, the IRS receives well over \$800 million in penalties for underpayment of estimated taxes each year.

Romeo: "Wow! Are you serious?!"

Kester: "If you don't have enough federal withholdings deducted from your earnings (if any at all), then the government will charge you a penalty for underpayment of estimated taxes. You see, the Federal government works on a pay as you earn system. When you think about it, banking institutions do the same thing if you are late with a payment"

- Romeo:* So how does that work? How am I supposed to know how much to pay when I have no idea what my earnings will be for the year; each month is different?"
- Kester:* "The simplest way to avoid the penalty is for you to use 100% of your prior year's tax liability as a base. Subtract any expected refundable credits and withholdings; if anything remains, that's what you are required to pay for the year."
- Romeo:* "So the IRS expects me to pay them one lump sum?"
- Kester:* "Actually, that remaining amount is to be divided into four equal installments, and paid on April 15, June 15, September 15 of the tax year, and January 15 of the following year. Please keep in mind when you pay on January 15 that it is for the filing tax year (previous year) and not for that current year. People tend to get confused and count that January 15 payment when they file for the following tax year."
- Romeo:* "Four installments sound more reasonable."
- Kester:* "If estimated taxes are not paid quarterly and/or the full amount is not paid by January 15, then a penalty will be assessed. *(Pause)* Romeo, I hesitate to mention this, but if you are close to meeting the requirements for making estimated payments, then as an alternative, you could invest the total amount and earn interest on it. However, please be aware that the interest is also taxable. Therefore, you will be increasing your tax liability by doing so. Nevertheless, that option is entirely up to you. Just make sure you consider the costs and the benefits."
- Romeo:* "Well I guess it's too late for this year, but I will discuss these options with Gigi and see how she feels about it. If we can't quite figure it out, would you be willing to help us?"
- Kester:* "Romeo, I'd certainly be happy to help you out, but please don't expect me to make the decision for you. You and Gigi will have to make that decision."
- Romeo:* "Great, I appreciate you taking the time to explain the penalty and estimated taxes to me. I also appreciate your willingness to help us determine alternatives. I guess now I have to get this tax return in the mail, along with a check. Thanks again Kester."
- Kester:* "Anytime Romeo. Call if you have any more questions."

EXHIBIT 1: SMART'S TAX INFORMATION

Romeo and Gigi Smarts tax information (*note: Romeo paid their taxes after April 15 of each year*):

2004 Tax Year

Adjusted Gross income	\$137,123
Itemized Deductions	\$ 65,753
Total Exemption	\$ 15,500
Interest Income	\$ 3
Tax	\$ 7,066
Child Tax Credit	\$ 600
Withholdings	\$ 4,213
Penalty	\$ 68

2005 Tax Year

Adjusted Gross income	\$ 86,575
Itemized Deductions	\$ 55,480
Interest Income	\$ 617
Child Tax Credit	\$ 1,534
Other Taxes (SE Tax)	\$ 2,918
Withholdings	\$ 672
Additional Child Tax Credit	\$ 469

2006 Tax Year

Adjusted Gross income	\$140,537
Itemized Deductions	\$ 37,173
Interest Income	\$ 3,993
Child Tax Credit	\$ 450
Withholdings	\$ 1,882
Phone Expense Credit	\$ 60

QUESTIONS

(Forms 1040ES Estimated Tax Worksheet and 2210 for years 2005, 2006, & 2007 can be obtained from: <http://www.irs.gov/app/picklist/list/priorFormPublication.html>; Schedule Y-1 Tax Rate Schedules for 2005, 2006, & 2007 can be found in Appendix A)

- (1) For the tax years 2005 and 2006, were the Smarts required to make estimated payments? If so, how much should each quarterly payment be?
- (2) Are the Smarts subject to a penalty for under payment of estimated taxes? If so, what is the amount of the penalty?
- (3) For the year 2006, should Romeo make the quarterly estimated payments or should he invest the amount into an interest bearing account (assume he invests the full amount of all four payments at the beginning of the year at a rate of return of 6% and then at 9%)? Discuss the differences and the risks involved.
- (4) What should Romeo keep in mind when considering the two options?
- (5) If you were the Romeo's accountant, how would you advise him on his future tax situation?
- (6) Use 2006 tax information & tax liability (assume there are no refundable credits and no withholdings) for the year 2007:
 - (a) Determine if estimated taxes are required for 2007.
 - (b) What should the payments be?
 - (c) Assume payments are not made; what will the penalty be?
 - (d) Should the Smarts consider investing? Why or why not?

THE PATTERN OF MINING INJURIES IN ZIMBABWE (2000-2002) AND THEIR IMPACT ON PRODUCTION: A STATISTICAL APPROACH

Lyman Mlambo, Institute of Mining Research, University of Zimbabwe
Trust Tendai Masiya, Institute of Mining Research, University of Zimbabwe

ABSTRACT

Mining injuries in Zimbabwe constitute a large percentage of all injuries in the country, and are among the highest in the region. This paper summarizes and explains the injury patterns over the period 2000-2002. Using a sample of 15 gold mines and data for 2000 as a case study, a log-transformed econometric model is used to investigate effects of injuries on production. The whole study period represents near normal conditions in the industry, before economic recession started to fully affect it. Such a retrospective study facilitates formulation of reflationary strategies and post-recession comparison. The five major causes of injury were striking by object, trucks and trammings, moving or rolling broken rock, machinery operation and fall of ground; and cases were higher for underground operations. Injuries decreased over the year from January to December. Over the week, the highest number of cases occurred on Tuesdays, while in a given day cases generally increased up to 1 pm and then dropped monotonically. The younger workers were the most affected. Ironically, the majority of incidences occurred when the victims were under supervision, had safety gear and had not ignored safety regulations. Econometric results confirm the existence of a negative albeit insignificant relationship between injuries and production levels, possibly indicating easy temporary substitution of the injured by the rural unemployed. Various recommendations to reduce injury frequency and severity are proposed.

KEYWORDS: Mining Injuries, Productivity, Safety Awareness

INTRODUCTION

Mining in Zimbabwe has contributed significantly to the country's Gross Domestic Product (GDP), foreign currency generation through direct exports of minerals (value added or primary), employment (direct and indirect), fiscus (through mining tax revenues), provision of raw materials for other industries including agriculture, agro-processing industries, chemical industries, construction industry, *et cetera*. Mining has played such a role in Zimbabwe for the past 1,000 years since the discovery and earliest mining of gold, silver, copper, iron and tin (Roussos 1988, in Mlambo 2010b, p.271).

In particular, the sector has made the following average percentage contributions: 4.5% of Gross Domestic Product in the 1990s; 4.5% of employment in the same period; 10.2% of Gross National Investment from 1992-1997; and 40-45% of foreign exchange earnings (Government of Zimbabwe, in Mlambo, 2010a, p.243). In 2010 the sector accounted for about 65% of exports and contribution to GDP was 13.3% in 2008, 12.4% in 2009 and was projected to 21.7% for 2010 (Chamber of Mines Zimbabwe, 2010). In 1996 it was estimated that the small-scale gold mining sector alone employed 10,000 people annually, excluding gold panners, whose number was estimated to be about 300,000 (Chimsasa, 1996, in Mlambo, 2010a, p.244). From 2001 to 2005 Zimbabwe's mineral export values ranged from about US\$248m to US\$841m, and these exports were to various destinations including RSA, Spain, USA, Japan, Germany, France, Brazil, China, India, Israel, Switzerland, Argentina, Iran, Indonesia, Korea, Malaysia, Taiwan, the Far East, Malawi, Zambia, Botswana, DRC, and Algeria (Ministry of Mines and Mining Development). The historical importance of mining to Zimbabwe's development is also illustrated by the fact that most town centers in Zimbabwe developed as mining towns (Roussos, 1988).

With such a significant contribution, it may be argued that the Zimbabwean economy is dependent on the mining sector.

Problem Statement, Objectives And Significance Of This Study

While the mining sector contributes significantly to the economic development of the country, it has left in its tracks many injuries and questions of sustainability from the perspective of human capital. Dependency or over-dependency of an economy on a particular sector which has negative effects on its capital assets, including human capital, inevitably raises questions of sustainability.

This paper seeks to:

- a) Give a summary of the pattern of injuries in the mining sector over the period 2000-2002, seeking to expose the pattern with respect to causes, related type of operation (underground or surface), time of injury (hour, day and month), age of injured, and whether or not the injured were under supervision at the time of injury, and the safety attitude in terms of whether or not in most instances safety regulations or safety appliances/clothing were ignored; and
- b) Investigate the effects of injuries on production by looking at the resultant losses in shifts as well as the econometric relationship between production levels and number of injuries. For the econometric exercise, use is made of a cross-sectional sample of gold mines.

All data used in the paper are obtained or estimated from mine returns and other sources at the Chamber of Mines and the Ministry of Mines and Mining Development. The period of study (2000-2002) is chosen because mine returns were more reliable then, after which data generation became very difficult because of the general difficult economic environment. The paper attempts to present the average pattern in a normal economic environment, which is further ensured by use of data spanning three years. The study period represents near normal conditions in the industry, before economic recession started to fully affect the industry. Such a retrospective study facilitates formulation of reflationary strategies and post-recession comparison. An exposition of the nature and pattern of injuries in the mining sector will directly imply certain key management policy options to reduce prevalence. It will also provide avenues for directed Government policy on occupational health and safety in the minerals industry. This study, being mainly descriptive, provides a background for further more intensive and extensive studies on the mining injury situation and the respective data capture processes in Zimbabwe.

Summary Characterization Of Injuries In The Mining Sector Of Zimbabwe

The major causes of injury over the study period were striking by object (18.6%), trucks and tramming (15.7%), moving or rolling broken rock (11%), operation of machinery (11%), fall of ground (ground subsidence) (9.7%), slipping and falling (7.8%), splinters and chips (4%), and burning and scalding (3%). Together these eight causes accounted for 81% of all reported cases, with each contributing a total of at least twenty five cases over the three years. Note that percentages and figures given in this paper are three-year totals. Total reported cases over the three years for each month were higher for underground operations than for surface operations. Certainly underground operations posed greater injury risks than surface operations by the mere restriction of the environment and the various demands for underground supports, which if not handled well turn into risks. Total annual cases fell over time from 2000-2002 for both surface and underground operations, probably indicating increased safety awareness and accident prevention measures by the mining sector. In general, total monthly cases, whether underground or surface, tended to fall over the year from January to December (though with fluctuations) – this being clearly the case for underground operations. The total for both surface and underground showed the same trend. Three distinct time intervals over a typical day were indentified with respect to the number of cases: midnight to 7a.m. when cases were relatively few (21%), 7a.m. to 1p.m. (49%) and 1p.m. to

midnight (30%). It is interesting that the time distribution of injuries was almost normal (though precisely multi-modal), showing that cases increased in general up to 1 p.m. and then started to drop afterwards. The greatest number of cases per single hour interval occurred in the 12 noon to 1p.m. interval. Generally injuries increased from Monday to Tuesday where they peaked, then decreased throughout the rest of the week, with Sunday having the least cases. The high cases in the early part of the week could indicate the lax tendency of the workers after a weekend during which most workers would be resting, with some drinking alcohol. It is also probably the part of the week that productive work is intense, with it fizzling out as we progress towards Sunday.

Injuries decreased with the age of workers – that is, mostly the younger workers were injured, with 72% of victims between 20 and 40 years of age. However, this could simply indicate that most employees in the mining sector were young people, because of the rigorous nature of the operations (if age distribution of employees was to be considered). Generally, injuries have increased with the number of years of experience. Those with less than 1-year experience had less than 100 cases, 1-3 years about 150 cases, 3-5 years about 110 cases, and over 5 years of experience about 480 cases. Assuming an even distribution of employees by experience, that could be attributed to either complacency or the need for retraining or both. However, if one could make the reasonable assumption that most employees in the mining sector are people who would have accumulated several years of experience, then the result could simply reflect that fact. Regarding whether or not the victim was under supervision, ignored safety regulations, had safety gear or lost a shift, the following results were obtained:

- a) The majority of cases (70.3%) happened when the victims were under supervision – which could imply low quality supervision;
- b) In most cases (64.7%) safety regulations had not been ignored - which could imply that the working environment was so bad that safety could not be guaranteed by sticking to regulations;
- c) Most victims (93.8%) had safety gear– which raises the question about the quality of the safety gear (that is, how safe was the safety gear); and
- d) In almost all the cases (95.6%), a shift was lost – which could have serious implications on production.

Econometric Investigation Of The Effects Of Injuries On Production: Case Study Of Gold

The annual production and injury statistics for year 2000 for a sample of fifteen gold mines under the Chamber of Mines of Zimbabwe are as depicted in Table 1 below. The sample is cross-sectional. The mines were selected because they had readily available statistics, and no sampling procedure was used. The objective of the exercise is to determine the quantitative and qualitative effects of injury cases on production levels of gold. Since the sample used is cross-sectional, the direct linear regression of y (output) over x (number of injuries) may cause the problem of heteroscedasticity (non-constant variance). Therefore, two regressions are done: the first, a direct OLS linear estimation, and the second, estimation of a log-transformed model to correct for heteroscedasticity. Direct regression of the data gives the following results:

$$\begin{aligned}
 y &= 929.79 - 10.5x, & r^2 &= 0.036 \\
 &(289.87) \quad (15.19), & df &= 13 & (1) \\
 t &= (3.208) \quad (-0.694), & F_{1,13} &= 0.48
 \end{aligned}$$

Table 1: Production and Injury Statistics (2000) for a Cross-Sectional Sample of Gold Mines

Mine Code	Mine Production (Kilograms), y	Injury Cases, x
A	409.99	41
B	3,366.54	2
C	1,050.58	16
D	351.62	43
E	124.6	6
F	672.26	21
G	414.42	9
H	1,116.59	32
I	353.92	2
J	221.3	7
K	1,097.69	2
L	604.8	5
M	408.01	2
N	208.53	2
O	1,533.93	1

This table shows production and injury statistics for fifteen gold mines in 2000. All data are from the Chamber of Mines of Zimbabwe (COMZ).

The positive constant in equation 1 shows that with zero injuries the amount of gold production would be around 930 kilograms on average. The negative coefficient of the injury variable shows that injuries negatively impacted on production levels, which is the expected outcome. Every case of injury recorded in the year had the marginal effect of reducing annual mine production by 10.5 kilograms. However, the negative coefficient is not statistically significant at 0.05 significance level (small t-value). Thus, on the basis of a direct regression, injuries are not a significant factor. This is probably the case especially where such injuries do not permanently remove the laborer from his or her work. In addition, because of high levels of unemployment among the less skilled people or temporary unemployment in the rural communities in which mining normally takes place, it could have been easy to get temporary replacements for injured workers.

A log-transformed model yields the following results:

$$y^* = 6.51 - 0.1057x^*, \quad r^2 = 0.024$$

$$(0.4148) \quad (0.1871), \quad df = 13 \quad (2)$$

$$t = (15.693) \quad (-0.565), \quad F_{1,13} = 0.32$$

The asterisks indicate that the variables are natural logarithms of the original variables. The coefficient of the transformed x variable is now the elasticity of annual output with respect to injury and, as expected, it is negative. However, its magnitude, which is less than one, indicates that though there was a negative response of output to injuries, that response was very insignificant. The same reasons given in the untransformed model above apply.

CONCLUSION

Assuming that the pattern of injury described in this paper has not changed, which is a very reasonable assumption in Zimbabwe, the paper shows the need to look into enhanced ground stabilization, underground supports, warnings of moving vehicles or trucks, safely timing the breaking or movement of rocks and enhanced awareness on safe operations of mining machines through further training. These measures would need to be emphasized especially in underground operations. Special safety awareness campaigns would need to target the earlier part of the year, earlier part of the week and the morning-to-1 p.m. shifts during which injuries were most prevalent. These could be intensive and extensive explanations on working environments and safety situations at the beginning of each year, week or day/shift, which would create common understanding among workers. A continuous process of education and awareness could effectively remove complacency or rusty awareness about safety issues among the

workers. There would also be need to improve on the quality of supervision through training. The case study on gold has shown that injuries resulted in reduction in production levels, though the marginal production effects were not very significant, probably because of easy substitution by the rural unemployed or underemployed laborers. This paper is evidently a summary description or characterization as no substantial effort has been made to explain the patterns. Explanation of the patterns would require a more intensive and extensive investigation which would involve interviews with mine workers, mine managements, and mining industry inspectorates as well as direct observation of working environments. In the wake of ironic results pertaining to injury cases vis-à-vis supervision, safety regulations, and safety gear, there is also need to further investigate the process of injury data capture to ensure that it is effective. Both issues need to be addressed by future research on this topic.

SOLAR ACTIVITY AND ECONOMIC RECESSIONS: THE CASE OF THE US

Cees J. Prins

ABSTRACT

The probability of a recession taking place depends on many variables. When the interest rate spread between 10 years government bonds and 3 months Treasury Bills is negative a recession is imminent. Also stock prices can give valuable information with predicting power. Solar activity as measured by the number of sunspots also adds to the explanation of the probability of a recession. In the 3 models that are estimated for 6 time periods the number of sunspots is always very significant. The sun has direct and indirect influences on the economy. To the first category belong damages to electronic networks. The indirect effects are the influences on human emotions and in the end also to the economy.

JEL: C1, C2, E1, E3, E32, N1, O4.

KEYWORDS: Cycles, Economic Indicators, Growth, Macro economic model, Probabilities.

INTRODUCTION

It is a well-known fact that recessions have both economic and non-economic causes. A few 100 years ago bad harvests, epidemics and wars were among the most frequent non-economic causes. There is growing evidence today that solar activity also plays an important part. The sun influences human emotions in different ways for instance human risk taking appetite. More direct consequences of solar activity are the damages to electricity and telecommunication networks caused by solar storms. These tend to gain significance, as the world gets more and more dependent on telecommunication. This article looks in particular also into the chances of a recession caused by solar activity. Since recessions cannot be explained by solar activity alone other factors have also to be taken into consideration. This implies a big demand for data. Data availability in the US for longer periods is well developed. Hence the aim of this article is to develop models that determine the chances of a recession in the past and present of the US. Relevant monthly data are available from around 1870, which will be the starting point of the analysis.

Economic Causes For Recessions

Commonly recessions are defined as 2 consecutive quarters of decline of the Gross Domestic Product. But since this implies the use of quarterly data another definition is used. The National Bureau of Economic Research (NBER) defines a recession as: “a significant decline in economic activity spread across the country, lasting more than a few months, normally visible in real GDP growth, real personal income, employment, industrial production and retail sales.” (NBER, 2010). Although a more exact definition of a recession would be more appropriate for this study, the big advantage of the NBER methodology is that monthly data can be used. The disadvantage is the fact that it can take up to one and a half year before the beginning or the end of a recession is announced. The June 2009 trough was announced as late as the end of September 2010.

This is not the place to explore in depth the economic causes of recessions. In brief we can distinguish the under consumption and under investment theory. Here the effective demand falls short of production capacity. National production will be decreasing. Prices decline as will interest rates. In the case of over investments consumption will be pushed out by investments if the economy runs on full capacity with rising prices and increasing interest rates. This is causing a turning point in the economic cycle. These

theories are endogenous in the sense that the economic cycle is a consequence of the underlying system of interdependent economic relations.

In economic literature monetary arguments play an important part in the explanation of chances of a recession with a major role for the Central Banks. The interest rate spread, defined as the difference between the 10 years Government Bonds and the 3 months Treasury Bills, has an important explanatory power (Bernanke, 1990; Estrella and Hardouvelis, 1991, Estrella and Trubin, 2006). Because of this strong relationship the interest rate spread is also used to predict recessions. Wright argues that the introduction of the Fed target rate improves the prediction power considerably. Interest rate spreads have different influences on the existence of recessions depending on the level of the Fed target rate. (Wright, 2006). Often the difference between the corporate bond yield and the 10 years Government Bond rate has a comparable influence on the chance of a recession, although with an opposite sign.

From 1933 until 1953 the term spread declined slowly and the volatility was very low. In that period dominated by the consequences of the Great Depression and World War II the 3 recessions lasted only a couple of months. Especially for the years after World War II but also in the twenties and early thirties it can be seen that just before a recession the interest rate spread is very low and is going up during the recession. Table 1 gives the data for the peak, the trough and the duration of recessions from 1870 onwards. As can be observed from the table before World War II the length of the economic downswing is with 21,0 months much longer than in the period after World War II when this amounted to 11,1 months. The opposite applies for the economic upswing, which is with 28,9 months before World War II much shorter than in the period after World War II with 58,4 months. As can be observed the length of the economic cycle, measured from trough to trough, has increased in time. This was caused by both a shorter contraction and a longer expansion period.

Because not only the difference between the long Government Bond rate and the short Treasury Bill rate matter but also the absolute level of interest rates, many researchers use for the prediction of a recession also the Fed target rate. Wright argues that the influence of inflation should be introduced as well, but he could only find a limited significance of the real Fed target rate. (Wright, 2006).

The aforementioned variables are of a monetary origin. This has the disadvantage that the real economy is not taken into account, although we can find many economic data there with predicting and/or explanatory power. Important are stock prices like the Standard and Poor's 500, the leading indicators of the OECD and The Conference Board. Similar variables are the gold price, as gold is used as a hedge against economic misery, and the oil price that triggered recessions in the mid seventies, the beginning of the eighties and aggravated the effects of the financial crisis when it reached an all time high in 2008. New building permits are an important leading indicator for recessions as the housing industry is an important part of GDP. Another leading indicator is new job creation. In predicting economic phenomena it is advisable not to limit oneself to only one kind of economic data. As a result both monetary and real economic variables will be used for the explanation and forecasting of recessions. A problem is the limited data-availability of some of the economic variables, which sometimes shortens the relevant time series to around 40 years or 500 monthly observations.

Solar Activity And The Economy

The sun goes through a periodic change around every eleven years where the polarity of the sun's magnetic field changes poles. When this happens and the magnetic field is weakest, there are very little sunspots. This period is called a solar minimum. A solar cycle is measured from minimum to minimum and lasts about eleven years. The intensity of the solar cycle can vary significantly. Sunspots are severe magnetic storms and show up as dark regions. The temperature is about 2000K lower than the average of the sun, which is 5700K. Sunspots are not the only indicator of the activity of the sun, but they appear to

be a reliable proxy for solar activity. Other indicators as the Average Magnetic Planetary Index (Ap index) have much less history. Sunspot data on the other hand are available for periods over hundreds of years on a daily basis, permitting the calculation of monthly averages and standard deviations. During periods of high levels of sunspots the sun emits more energy than during periods of sunspot minimums. At the moment, entering solar cycle 24 (SC24), the solar activity is rather low, but increasing.

Table 1: Peaks and troughs in US business cycles, 1870 – 2011

Peak	Trough	Contraction in months	Expansion in Months
06-1869	12-1870	18	18
10-1873	03-1879	65	34
03-1882	05-1885	38	36

03-2001	11-2001	8	
12-2007	06-2009	18	73

This table gives the duration of a recession with peaks and troughs in months. Also the length of both the expansion and the contraction periods is given. The source of this table is NBER, 2010.

The English economist William Stanley Jevons, born in 1835, belonged to the group of first theoretical economists who used exogenous cycle theories for the explanation of economic cycles. In 1879 he published in Nature his article “Sun-Spots and Commercial Crises”. The difference between the length of the economic cycle and the sunspot cycle was so small that in his opinion it could not been a coincidence (Jevons, 1879). Further econometric research pointed out however the poor correlation between the data. This is the reason that nowadays the so-called *sunspot variables* are random data without a meaningful effect on the economy (Shell and Cass, 1983).

It is known for a long time that a relation exists between solar activity and extreme winters (Visser, 1949). During the end of the seventeenth century solar activity was very low. Very few sunspots were observed on the sun from 1645 to 1715. This period of low solar activity corresponds to a climatic period called “The Little Ice Age” when rivers that were normally without ice were frozen and snow fields remained year-round at lower altitudes (Hathaway, 2011). Extreme winter weather can have serious negative effects on the economy. Especially sectors like agriculture, transportation and construction are vulnerable in this respect. On September 2 1859 the earth, especially the US, saw the last super solar storm. At that time the use of electricity and radio was not widely spread. Nevertheless the damage was considerable. Telegraph messages were not readable and all radio and telegraph connections in North America and Europe were seriously unsettled for many hours. Also more recently in 1989 North America experienced the results of

a solar storm. Millions of people in the Canadian province of Quebec had no electricity during 9 hours. The damage amounted to around \$ 500,000,000. But also the US experienced electricity problems with among other things a break down of the Salem nuclear plant in New Jersey. There was a significant impact on the electricity market in Texas (Forbes and St. Cyr, 2006). Liam Fox the British Defence Secretary delivered a keynote address at an International Conference on the Vulnerability of Electricity Grids in September 2010 stressing the huge future damage that might be caused by solar storms (Daily Mail, 2010). The potential damage of these solar storms can amount to 1,500 billion Euros.

In order to be prepared for future disasters the US Congress asked in 2008 The National Oceanic and Atmospheric Administration (NOAA) and the National Academy of Sciences to investigate and study how to protect the Earth from ferocious solar flares. Power grids, GPS navigation, air travel, financial services, internet communication and emergency radio communications all can be knocked out by intense solar activity. In the development of models for the prediction of future “space weather” daily or monthly numbers of sunspots cannot be used. Intraday Ap indices are more appropriate in this respect.

The prediction of sunspots according to “The International Sunspot Numbers” is carried out by NASA. The sunspot numbers used here are the so-called “Boulder” numbers, which are typically about 30% higher. For the beginning of the current solar cycle SC24 NASA made a number of forecasts. The first one estimated the bottom of SC23 and hence the beginning of SC24 in December 2007, with a peak between 156 and 180 sunspots. The forecast of December 2010 used an actual start of SC24 in February 2009 with a predicted peak of 64 sunspots. Until recently the actual sunspot numbers were lower than forecast. This changed in the last three months. At the moment the most recent NASA prediction (November 2011) gives a number of sunspots for the peak in the middle of 2013 of 89, which is still rather low. (Hathaway, 2011). A lot of non-scientific articles have been written about the influence of solar activity on the human brain and on human behaviour. But also serious research, although not abundant, can be found. In these studies the sun has also more indirectly a big influence on humanity and hence on the economy. Changing magnetic fields have an impact on the human brain.

There is evidence that solar activity influences the number of traffic accidents (Stoupel et.al., 2009). More generally the risk appetite is influenced by solar activity. Psychology pays a lot of attention to the relationship between depressions, anxiety and altered moods on one hand and solar activity on the other hand. Wong and Carducci have studied the relationship between altering moods and geomagnetic activity in relation to financial decision taking (Wong and Carducci, 1991). Krivelyova and Robotti did the same but on an even bigger scale. They have investigated the risk appetite of investors in combination with their behaviour on financial markets in relation to solar activity for 13 stock markets. For all stock markets they found significant effects (Krivelyova and Robotti, 2003).

Modis found a correlation between GDP data of the US and the number of sunspots as well as between the Dow Jones industrial Average and the number of sunspots for a period of 80 years. He used this for forecasts with a future horizon of 10 years. He argues however that the rather low correlation he found implies a high level of uncertainty (Modis, 2007). The next graph gives the relationship between recessions in the US and the number of sunspots for the period 1871 – 2011. Especially for the period after World War II an increase in the correlation can be noticed. Before World War II the economic upswing was much shorter. Measured from trough to trough the length was 47,6 months, while after World War II this increased to 71 months. Because of this the solar cycle was in the former period much longer than the economic cycle, but in the latter period the difference was smaller. Because of this difference in length the solar cycle measured by sunspots can never explain all economic recessions. More information and other data are needed in this respect.

Figure 1: Recessions and sunspots in the US, 1871 – 2011.

The probability of a recession (1= recession, 0 no recession) can be found on the right hand scale. On the left hand scale the number of monthly sunspots is given. In the graph prior to 1940 each peak in the number of sunspots is related to a recession, but the number of recessions (17) outnumbers by far the peaks (7) in the level of sunspots. Although only 12 recessions can be observed after 1940, the same conclusion holds.

Recessions can be caused by other events than solar activity. Examples for this are the financial crises of 1929 and more recent of the crisis of 2008. It can be observed that in recent years the solar activity was low. August 2009 was the first calendar month in over 100 years that no sunspots were recorded.

A Probit Choice Model For Explaining And Forecasting Recessions In The US.

This Probit model generates the probability of a recession from a group of economic and financial indicators and from the solar activity measured by the average number of sunspots per month. The question to be answered is, what is the probability $(\text{Prec})_t^\gamma$, that the US economy is during period “t” in a recession over a 12, 18 and 24 month’s horizon, indicated by γ . As indicated earlier a recession is denoted by “1” and “0” indicates no recession. The model takes the following form:

$$\text{Prec}_t^\gamma = \Phi (\alpha + \beta_1 X_{1,t-n} + \dots + \beta_i X_{i,t-n})$$

In the equation above Φ symbolises the cumulative normal distribution function. The suffix “t” gives the time in months. The model specification uses periods starting from 1871 and ending in December 2009. This enables an out of sample forecast. The in-sample estimation gives the McFadden R-squared, which measures the goodness of fit of the Probit regression. Next to this a specific information criterion, the Hannan-Quinn criterion, is used. This measures not only the goodness of fit, but also includes a penalty on the number of explanatory variables used, which the McFadden R-squared does not take into account.

For the longest period of 1871 - 2009 with 1656 monthly observations the annual return of the Standard and Poor’s and the number of sunspots were significant. The higher the returns on the stock market, the lower is the probability of a recession. The stock market is a good indicator of the financial health of the economy and of the corporate sector well-being. The sign of the sunspots is positive, indicating that with a high number of sunspots the chance of recession is higher. For all three forecast horizons the annual change of the consumer price index is a significant variable with a negative sign. Decreasing prices do increase the possibility of a recession. A low or decreasing yield of 10 year Government Bonds indicates a higher probability of a recession.

Table 2: Overview of the variables used in the various models.

sunspots	: the average number of sunspots in a given month.	The average number of sunspots in a given month.
sp500	: the level of the standard and poor's 500.	The level of the Standard and Poor's 500.
Uscpi		US Consumer Price Index
Usspread		US 10 years Government Bonds minus 3 months Treasury Bills
ustrcn10		US 10 years Government Bonds
Corpspread		Baa corporate bonds minus 10 years Government Bonds
unempl		Percentage unemployed
Newjobs		Change in non-farm pay-rolls
Oilprice		Oil-price in US\$ per barrel
Usoecdldng		OECD Leading Indicator for the US
caputman		Capacity Utilisation Manufacturing Industry
Claims		Initial claims for unemployment insurance
Ufsdtrg		US Fed Target rate
Goldbln		Gold-price in US\$ per ounce
Usnapmo		ISM manufacturing new orders index
Ussurindex		ISM manufacturing new orders index minus ISM purchasing managers index
permits		Building Permits
indprod		Industrial Production
Mut		First difference with respect to 12 months ago
mut6		First difference with respect to 6 months ago
Yr		Annual growth
Qu		Quarterly growth
T		Time in months
-n		time lag in months

This table gives the symbols used in the tables with the regression results. When a variable appears in the estimated models for the first time, a detailed explanation is given. Sources for these variables are Datastream, The Federal Reserve Board, The National Geophysical Centre NOAA, The National Bureau of Economic Research (NBER) and Economagic.

Table 3: Estimation results for the period 1872 – 2009.

Estimation period:		1872.01 - 2009.12			
Number of observations:		1656			
Probability of recession within		12 months	18 months	24 months	
Variables		Timelag	Timelag	Timelag	
	constant	0.262	***	0.564***	0.788***
sp500yr	-0.027	***	-0.019***	-0.016***	
sunspots	-7	0.003	*** -4	0.004***	0.006***
uscpiyr	-0.014	***	***	-0.022***	-0.016***
ustrcn10	-0.042	***	***	-0.071***	-0.098***
McFadden R-squared:	0.116	0.084	0.086		
Hannan-Quinn criterion	1.237	1.239	1.153		

*Statistical significance is indicated by ***, ** and * indicating significance at the 1, 5 and 10 percent levels respectively. All variables have the right sign and are highly significant. In this long term model stock prices (S&P 500) have the highest significance, followed by the number of sunspots.*

It is clear that the model has one interesting and significant long term variable: the number of sunspots. The rather low goodness of fit of the model also indicates that the model is not fully specified. When taking more recent periods into account, the availability of more variables however will improve the quality of the model. The next model, of which table 4 gives the details, deals with the period 1920 until 2009 and counts 1076 observations.

Table 4: The estimation results for the period 1920 – 2009

estimation period:		1920.05 - 2009.12					
number of observations:					1076		
probability of recession within			12 months		18 months		24 months
variables			timelag		timelag		timelag
	constant		0.141*		0.064*		0.299*
	sp500yr		-0.016***		-0.007***		-0.005***
	sunspots	-7	0.007***	-4	0.008***		0.011***
	usspread	-3	-0.721***	-4	-0.766***	-4	-0.797***
	corpspread		0.425***		0.445***		0.465***
	ustrcn10		-0.089***		-0.076***		-0.089***
mcfadden r-squared:			0.332		0.305		0.318
hannan-quinn criterion			0.921		0.984		0.959

Statistical significance is again indicated by ***, ** and * indicating significance at the 1, 5 and 10 percent levels respectively. All variables have the right sign and are highly significant. The most significant variable is the spread between 10 year Government bonds and the 3 months Treasury Bills, followed again by the number of sunspots.

Two interesting variables could be added to the estimation: the USSPREAD, also indicated as “term spread” and the CORPSPREAD. The former is the difference between the 10 years Government Bonds and the 3 months Treasury Bills. It is clear that the sign is negative: the lower the spread the higher is the possibility of a recession. The CORPSPREAD is the difference between the BAA corporate Bond and the 10 years Government Bonds. The sign is positive: an increase of the corporate risk raises the corporate bond rate and this is what happens during recessions. It was not possible to find a significant influence of inflation. The goodness of fit increased. The both spreads contributed as expected to the overall result. All variables are significant with the right sign. In all 3 cases the constant of estimation was not significant. The USSPREAD has the highest significance, followed by the number of SUNSPOTS. Given the scope of this article this is again an interesting result.

The third period covers the years 1929 – 2009 with 963 observations. Only one new and significant variable could be introduced: the unemployment ratio. Normally the unemployment ratio is considered to be a lagging variable, but when the 6 months difference is taken (MUT6UNEMPL) a leading indicator is the final outcome. The estimation results were as follows.

Table 5: Estimation results for the period 1929 – 2009.

Estimation period:		1929.10 - 2009.12					
Number of observations:					963		
Probability of recession within			12 months		18 months		24 months
Variables			Timelag		Timelag		Timelag
	constant		-0.192*		0.008*		0.188*
	sp500yr		-0.015***		-0.005*		-
	sunspots	-7	0.007***	-4	0.009***		0.011***
	usspread	-3	-0.661***	-3	-0.659***	-3	-0.623***
	corpspread		0.329***		0.319***		0.281***
	mut6unempl		0.339***		0.261***		0.299***
	ustrcn10		-0.056***		-0.071***		-0.087***
McFadden R-squared:			0.366		0.314		0.312
Hannan-Quinn criterion			0.852		0.965		0.977

Statistical significance is again indicated by ***, ** and * indicating significance at the 1, 5 and 10 percent levels respectively. All variables have the right sign and are highly significant. The most significant variable is USSPREAD, followed again by the number of sunspots.

The goodness of fit did not increase a lot if we compare the results with those of the previous models, despite of the fact that a new variable was introduced. For the 24 months forecast horizon the returns on the stock market were not significant any more. All other variables with the exemption of the constant

were significant and had the right sign. The term spread is the most important variable with the sunspots ranked second in reliability, what makes this outcome again very interesting.

In the fourth model a number of new variables could be introduced. The first one was NEWJOBS, the change in non-farm employment. This time also the OILPRICE could be used. A good leading indicator is the OECD leading indicator of the US. The capacity utilisation of the manufacturing industry measures the production constraints and is hence a powerful predictor of the future situation of the economy. This variable is indicated with CAPUTMAN. Furthermore initial jobless claims (CLAIMS) signal an early improvement or worsening of the labour market. The results for the period 1949 – 2009 with 732 monthly observations are summarised in table 6.

Table 6: Estimation results for the period 1949 – 2009.

Estimation period:		1949.01 – 2009.12					
Number of observations:		732					
Probability of recession within		12 months		18 months		24 months	
		Timelag		Timelag		Timelag	
Variables	constant		-1.009***		-0.54***		-0.738***
	sp500yr		-		-		-0.011***
	sunspots	-13	0.017***	-4	0.013***		0.018***
	usspread	-3	-1.347***	-1	-1.058***		-0.978***
	corpspread		0.511***		0.381***		-
	mut6unempl		1.715***		0.804***		0.922***
	newjobs		-0.002***		-0.002***		-
	oilpriceyr	-3	0.011***	-3	0.012***		0.021***
	mutusoeclldng		-0.271***		-0.477***		-
	caputmany		0.186***		0.139***		0.157***
	claimsy		-		0.026***		0.035***
	ussurpindex		-0.067***		-		-
McFadden R-squared:			0.649		0.545		0.545
Hannan-Quinn criterion			0.496		0.664		0.677

In comparison with the previous estimation period the models gained explanatory power. The number of sunspots ranked for the fourth time second in significance. The annual growth of the oil price, the annual growth of the capacity utilisation in the manufacturing industry and change in non-farm payrolls (NEWJOBS) were significant and had the right sign for all 3 forecast horizons. The stock market returns, the corporate spread the OECD leading indicator and the initial jobless claims failed to be significant in at least one of the models and were left out of the estimation result.

Table 7 summarises the estimation for the period 1960 until 2009 and covers 595 observations. A couple of very useful variables could be introduced since they were available for this time frame. A very important variable that measures investment and consumer sentiment is the GOLDPRICE. A higher gold price makes a recession more likely. Although the spreads were used in earlier models successfully, it makes quite a difference if interest rates are high or low at a given spread. The Fed target rate (USFDTRG) proved to be a good additional variable. The housing market is a leading indicator of the economy. The building permits (PERMITS) are looking ahead quite well. A decreasing number of building permits often imply that a recession is imminent. The difference between the ISM new orders index and the ISM purchasing managers index is called USSURPINDEX. This variable sometimes indicates a surprising future turning point in the economic cycle.

The last model covers the period 1968 until 2009 and counts 504 observations. Here no new variables were added. This period looks more or less like the period used for a probit model estimated two years ago with forecast horizons of 6,12 and 18 months (Prins, 2009). The results for the last two models are highly comparable with the estimation result of that study with the two spread variables, the number of sunspots, the gold price and the building permits as the same variables. The estimation period however was somewhat shorter than the results discussed here. Table 7 summarises again the mean features for the last model.

Table 7: The estimation results for the period 1960 – 2009

Estimation period:		1960.05 - 2009.12					
Number of observations:		595					
Probability of recession within		12 months		18 months		24 months	
		Timelag		Timelag		Timelag	
variables	constant		-5.907***		-5309***		-3.646***
	sp500yr		-0.057***		0.034***		-0.035***
	sunspots	-13	0.032***	-4	0.026***	-1	0.023***
	usspread	-3	-2.097***	-3	-1.315***	-4	-1.129***
	corpspread		0.813***		0.622***		0.476***
	mut6unempl		2.122***		0.925***		1.196***
	oilpriceyr	-3	0.031***	-2	0.029***	-3	0.019***
	usfdtrg	-9	1.139***		1.009***		0.672***
	uscpiyr	-4	-1.066***	-2	-0.881***	-2	-0.476***
	goldblnyr	-9	0.101***	-3	0.098***		0.075***
	claimsyr		0.065***		0.046***		0.018***
	permitsqu		-0.066***		-0.041***		-0.047***
McFadden R-squared:			0.885		0.819		0.747
Hannan-Quinn criterion			0.221		0.311		0.418

The goodness of fit for this period is again much improved. The USSPREAD is now the most significant variable for the shorter forecast horizons of 12 months. In this case the number of sunspots remains on second place. For the two longer time horizons the number of sunspots ranks third. This variable remains without any doubt a very important one. The annual growth of the gold price is the most important variable for the two models with the longest forecast horizon, with the USSPREAD ranking second. In each case the Fed target rate is highly significant. For all 3 time horizons the same model specification could be used.

Table 7: The estimation results of the period 1968 to 2009.

The number of SUNSPOTS ranks as third. As in the model for the previous period the FED target rate is very significant. The oil price is only valid for the longer forecast horizons. The inflation is back again in the 3 models as are the returns of the Standard and Poor's. For the 2 longer periods the goodness of fit is slightly better than in the models of the previous period. The significance of the gold price and USSPREAD is the highest, but the number of sunspots remains very important, ranking 2 to 4. For the longer time horizon the quarterly growth of the building permits takes the place of the annual growth. All the other familiar variables like the Fed target rate and the USSURPINDEXT are included.

Assesment Of The Estimation Results

It will be clear that the first 2 models are only interesting in the sense that they produced the number of sunspots as a non-economic and highly significant variable. The lack of data limited the practical usefulness of these first 2 models. From 1929 onwards the availability of data increased in such a way that the models can be compared. In total 12 models were estimated with 6 variables that appeared in one or more of the models, starting with the model of 1929 – 2009. Variables that appeared only in the last

two models are not taken into account. Table 8 gives these variables and the number of times they appeared as a significant variable.

Table 8: Variables used in models starting since 1929 and number of significant appearances.

Variable Name	Number of Significant Appearances
Usspread	12
Sunspots	12
Sp500yr	10
Corpspread	10
Mut6unempl	10
Uscpiyr	6

Like the USSPREAD the SUNSPOTS appeared even in every of the 18 estimations making it one of the most powerful variables. Other very important variables for shorter estimation periods are the gold price and the Fed Target rate.

It is possible to make a comparison of the observed chance of a recession within a certain number of months and reality. It makes sense to present the results for one of the more recent periods. It is impossible to present here the forecast results with the observed probabilities for all 18 models. Figure 3 gives the results of the observed probability of a recession in 12 months in combination with the in-sample forecast for the model for 1960 – 2009 with 595 observations.

Figure 3: Observed probability and forecast of a recession within 12 months, 1960.05 – 2009.12

The model behaves properly but doesn't give, as could be expected, a perfect forecast. A false signal gives with a probability of more than 60% an unjustified beginning or end of a recession. Two false signals can be distinguished. The first one is in the beginning of 2003 where a recession is announced for 2 months, the other one is June 2008. That signal predicted the end of a recession. Furthermore it happens a few times that the model gives the beginning and/or the end of a recession 1 or 2 months too early or too late as happened for instance in July 1998 where the model announced a recession one month too early. This can be considered as an early warning.

Figure 4 gives these results for the latest set of models of 1968 - 2009 with a forecast horizon of 18 months.

Figure 4: Observed probability and forecast of a recession within 18 months, 1968.01 – 2009.12

It can be seen that the model produces nice results. A couple of weak false signs were given for the recession that started in July 1990. The recession of 2000 had a clear early warning. From May 2007 a few signals emerged indicating an end of the recession. Other more recent models give similar results also for the time horizons of 12 and 18 months. The first 2 models with a very long estimation periods of 1656 and 1076 months produce more modest forecasts as can be expected from their lower goodness of fit. It turned out, when comparing the estimation results, that in all cases models with longer forecast horizons had lower explanatory power than models with shorter forecast horizons.

The Future Probability Of A Recession

Currently (December 2011) data up to November 2011 is available for all the variables in the models. This enables an out of sample forecast with a forecast horizon of up to twenty-four months. This means the probability of a recession up to November 2013 could in principal be calculated. It is necessary however to compromise between a forecast with a long timeframe and the use of a model with a higher explanatory power, which implies a shorter forecast horizon. The compromise is found with a forecast horizon of 18 months. This enables a forecast up to April 2013, using the models with an estimation period of 595 (table 6) and 504 (table 7) observations. Table 9 summarises the chances of a recession of these 2 forecasts.

Table 9: Forecast results for the probability in % of a recession in the US in the coming 18 months.

Date	Model Table 6	Model Table 7	Date	Model Table 6	Model Table 7
2011 11	0.0%	0.0%	2012 08	0.0%	0.0%
12	0.0	0.0	09	0.0	0.0
			10	0.0	0.0
01	0.0	0.0	11	0.0	0.0
02	0.0	0.0	12	0.0	0.0
03	0.0	0.0		0.0	0.0
04	0.0	0.0	2013 01	0.0	0.0
05	0.0	0.0	02	0.0	0.0
06	0.0	0.0	13	0.0	0.0
07	0.0	0.0	04	0.0	0.0

Source: Own calculations based upon the models of tables 6 and 7. The chances of a recession in the United States in the next 18 months till April 2013 are nihil. Both models give the same outcome.

Some of the variables used in the models may point to a recession like the level of unemployment and the gold price, but others are more favourable like the annual returns of the Standard and Poor's 500 Index

and the spread between the 10 year's Government Bonds and the 3 months Treasury Bills. Also the inflation is going up, which is not common for a recession.

CONCLUSION

The number of sunspots, as an indication of the activity of the sun, appeared to be a highly significant variable in explanation of a recession during all the periods investigated. Although existing literature explains possible reasons, more research is needed to understand it fully. But as could be expected more variables than the number of sunspots are needed to give an acceptable explanation of the existence of recessions in the US. Periods with very low numbers of sunspots can be found in a recession too. High numbers of sunspots however almost always indicate that we are in the middle of a recession.

ACCESSION TO THE EUROPEAN UNION: THE CASE OF TURKEY

Alican Kavas, Winston-Salem State University
Ender Duygu Kavas, Indiana University-Bloomington

ABSTRACT

Turkey has a long standing and most controversial external relationship issues of the European Union (EU). Even though Turkey is the oldest associate member in the EU, full membership negotiations started in 2005, but the negotiation process has been going remarkably slowly and lately described as train crash and since 2007 no progress has been made. The aim of this paper is to examine Turkey's bid for the EU membership- one of the most controversial and long lasting issues confronting both sides- from historical, geographical, cultural, and economic perspectives. After introducing key historical steps in Turkey's accession process, its place in the EU enlargement picture, concerns and support for Turkey's accession are discussed. Strategic options and potential implications for both sides are also presented. Future of the accession talks depend on both Turkey's full commitment and determination to carry out the necessary reforms and also the EU's fair treatment and support of Turkey in its journey for full membership.

INTRODUCTION

The ceaseless saga of relations between the European Union (EU) and Turkey provide an excellent learning tool of the policies, challenges, and opportunities in the integration efforts of two different parties and a critical thinking discussion about future of the relationship. More than fifty years, Turkey and Europe have been anticipating the country's membership in the EU. In fact, Turkey has been waiting to become a part of the European Union since 1959. While Turkey started the full membership negotiations in 2005, the process has been going remarkably slowly and lately described as a "train crash" (Akçakoca, 2006). With its emerging and rapidly growing economy, its geopolitical and strategic location, and with a population of close 78.7 million people, Turkey has today become the world's 17th largest country and 15th largest economy by GDP-PPP. Turkey is a shining (and *rare*) example in the Islamic world of a secular democracy and a successful free-market economy. Turkey has a long standing - the oldest associate member- and the most controversial external relationship issues of the EU. Since 1963, additional twenty-one countries joined the Union. It will be grown from six members in 1952 to 28 members in 2013. Even though it started the membership negotiations in 2005, lately the negotiations have stopped.

Concerns In The Eu About Turkey's Accession

Turkey has a long history of interaction with Europe, but its status as a European country has always been a bit ambiguous for the following reasons (Schimmelfennig, 2009): First, the country is considered too *poor* and *too agricultural*. Turkey's GDP per capita reached 43 % of the EU average (EU27=100) - less than any of the member states. [GDP per capita (PPP-US dollar): EU is \$34,000 vs. Turkey's \$14,600]. The Turkish agricultural sector is still the largest economic sector and employs around 25 % of the workforce (as compared to an average of 5 % in the EU). Second, the impact of socioeconomic divergence is magnified by the size of Turkey's population and market. It is considered *too big*. With more than 78, 7 million inhabitants, Turkey would be the second largest member state and likely to surpass Germany. Although the EU's institutional rules reduce the effect of population size on political power, Turkey would rank among the big member states with regard to seats in the European Parliament and votes in the Council and could gain at least considerable blocking power.

Third, **Turkey's European identity** is controversial. Obviously, the largest part of Turkey's territory is geographically located in Asia. The core issues, however, are culture and democracy. Even though the Turkish state is secular, 99.8% of the total population is Muslim. In sum, Turkey would increase heterogeneity in the EU considerably and add to the decision-making problems of the union. Scherpereel (2010) in his research concludes that:

*“Even though there is no official **acquis** for broad ‘cultural fit’ questions, Turkey is culturally quite different in terms of language use (highest monolingual country: 67%), and religion (Only 2.5% does not identify with a denomination, which is Muslim). Most Turkish citizens remain outside of Europe’s cultural configuration. These differences, however, do not necessarily preclude the possibility of smooth integration into the EU”.*

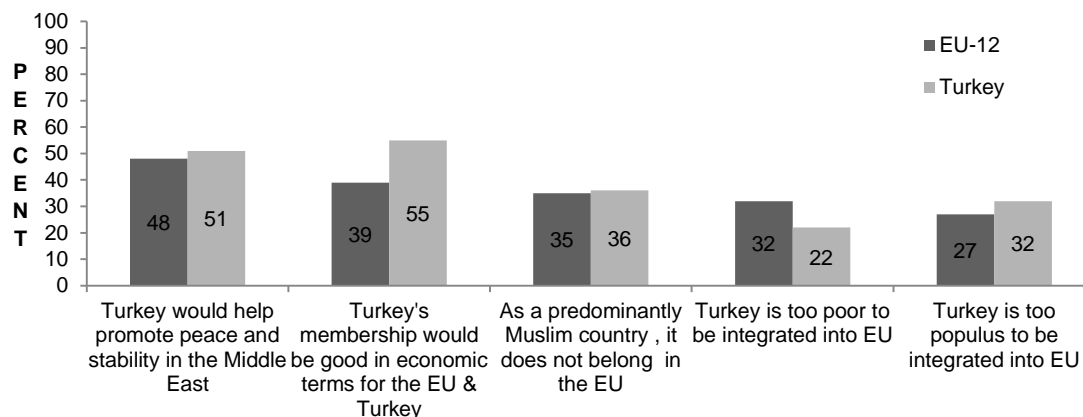

Support For Turkey In The Eu

The European attitude on Turkish accession has also been subject to changes over the years. Europeans are much more against Turkish membership today than a few years ago. High opposition to Turkey's accession exists in some countries with the highest percentage of Turkish immigrants (with the exception of the Netherlands and Sweden), which may reflect the lack of integration of immigrants/or the xenophobic attitude of the local populations. Both 2007 and 2008 surveys in the EU-27 show that on the average 31% are in favor of Turkey's membership. Furthermore, the survey of *Transatlantic Trends* (2011) shows that among the EU-12, only 26% thought that Turkey's membership is a good thing, while 56% indicated that Turkey is likely to join the EU. Figure 1 shows agreements of Turks and EU-12 about Turkey's membership in the EU. Half of those polled in the 12 EU countries disagreed that Turkey's EU membership would be good in economic terms for the EU. The majority of Turks (55%), on the other hand, thought that EU membership would be good for the Turkish economy. In addition, among Turkish public, those who thought Turkey's EU membership would be a ‘good thing’ dropped steadily from 73 percent in 2004 to 40 percent in 2007 and to 38 % in 2010.

What Happens If Turkey Were Admitted To The Eu

Kubicek (2005), in his article indicates that without question, Turkish membership would transform the EU in profound ways. **Geographically**, Turkish entry into the EU would push the borders to the EU further south and east. Its inclusion would mean the EU would now border Iran, Syria, and perhaps most troubling Iraq. **Culturally**, expansion to Turkey would be the first time the EU would cross the traditional border of ‘Christendom’, and some fear that the inclusion of a large Muslim country would be difficult for the EU to swallow. **Politically**, there would be certain tactical challenges (e.g. Turkey would soon become the largest country in the EU, there could be great problems with Turkish emigration), but also larger, more strategic issues such as what does inclusion of Turkey say about Europe's identity and values”.

Figure 1 : Attitudes about Turkey's membership

This figure shows the Turkish people and the EU-12 attitudes about Turkey's membership. The numbers shown on each bar indicate agreement to the statements by two groups. EU-12 includes France, Germany, Italy, The Netherlands, Poland, The UK, Portugal, Spain, Slovakia, Sweden, Romania, and Bulgaria. The results were taken from Transatlantic Trends Key Findings 2011 Report.

The comparative data about Turkey versus EU-27 shows that Turkey's inclusion would also transform the European Union **economically**.

- ✓ The EU population would increase by 15%; since Turkey has the second largest population in the EU, and 17th largest in the world;
- ✓ The EU economic output would grow by 10% ; currently Turkey is the 15th largest economy in the world;
- ✓ The GDP-PPP per head would amount to roughly 43% of the EU-27 average, which means average of EU-27 would be lower;
- ✓ More future trade transactions would be possible because of the customs union agreement signed in 1995;
- ✓ There is also fear that massive cross border migration would set in. Another economic concern is related to structural fund appropriations from the EU. It is estimated that if Turkey were now an EU member state, it would receive about 27% of Structural Fund Appropriations.

Alber (2007) came up with the following comments on why Turkey should be admitted to the EU:

“Allowing Turkey to join the Union would also give the EU a chance to benefit from the massive economic growth that can be expected in Turkey for the next two or three decades. The European Union has much to gain politically from a firm integration of Turkey into its ranks. If Turkey joined the Union, this would be proof that an Islamic society can be part of the West”.

Turkey has a functioning market economy. It is ranked 73rd out of 179 countries in *the Economic Freedom Index*, and 59th out of 142 in *the Global Competitiveness Index*; also has become increasingly integrated with the West through membership in organizations such as the Council of Europe, NATO, OECD and the G-20 major economies but has to make progress in *Freedom House*, *Corruption* and

Table 1: Comparison of Macro Indicators: EU 27 vs. Turkey

Indicators	EU-27	Turkey	% of EU
Population (millions)	502.4	78.7	15
GDP-PPP (\$ trillions)	15, 39	1, 55	10
Real GDP Growth rate (%)	1.6	6.6	
GDP-PPP per head (\$)	34,000		
Agriculture Labor (%)	4.7	25.5	
Unemployment (%)	9.4	10.3	
Inflation (%)	2.9	7.8	
Exports -2010 (\$)	1,791	133 billion	7.4
Imports-2010 (\$)	2, 0	212 billion	11

This table shows the macro indicators in the EU-27 and Turkey, prepared from The CIA World fact book. 2011 estimates.

Human Development indices, in order to increase its ability and capacity to take the obligations of the membership. Turkey's ability to assume obligations of membership and its administrative capacity to implement *the acquis*-80,000 pages of rules and regulations divided into 35 chapters- is a major concern. Of the 35 chapters, 12 have been opened-meaning Turkey is harmonizing its laws to EU standards, with only one of them declared complete in terms of Turkey's compliance. Another 12 chapters have been blocked to Turkey, of which the European Council suspended eight in 2006 because Turkey refused to open its ports and airports to ships and planes from Cyprus, 3 and France blocked five in 2007. These challenges to Turkey's EU accession process, perceived as unfair, have fuelled bitterness, and then Turkey-EU relations have entered the "silent period" since 2007.

Strategic Options For Both Sides

Throughout the 1990s, there was much discussion on what should be the main priority for the EU: '**widening**' (enlargement to the east made possible by the end of the Cold war) or '**deepening**' (more political integration that would build upon the accomplishments of the Maastricht Treaty). In 2004, there was an answer: The EU would do both. The EU added **ten** new members, the largest expansion in its history. Turkish membership presents the EU with many challenges and opportunities. Despite the troubled past and uncertain future of its relations with the EU, Turkey continues to pursue EU membership. The negotiation process for Turkey has- for the first time in EU history- been classified as an "*open ended process whose outcome cannot be guaranteed beforehand*"; there is a deep silence and tiredness in Turkish society and the state. However, A change in the internal dynamics of the EU- especially a change in the leadership in France and Germany- who opposes to Turkey's accession- can bring a new hope for the relations. Both parties must find a way to avoid the ultimate "train crash". In the light of the existence of strong countervailing forces and highly controversial and longest accession process so far, there are still possible outcomes to Turkey's bid for full membership: (Macmillan, 2009)

- ✓ Spillover in the form of a failed accession process
- ✓ Encapsulation in the form of a 'privileged membership' or similar arrangement-
- ✓ Spillover in the form of a successful and complete integration of Turkey into the EU

Turkey's EU membership will continue to be a challenging agenda item both in the EU member countries and in Turkey. EU membership will transform the Turkish economic, political, legal and socio-cultural structures. However, there is also fear of loss of traditional values and potential assimilation. As things stand today, the future direction of the Union cannot be predicted with certainty since the EU is currently struggling to deal with internal problems -the sovereign debt crisis in the Eurozone and high unemployment. There is always room for cautious optimism that Turkey will eventually accede to the EU. Despite the troubled past and uncertain future of its relations with the EU, it depends on Turkey's full commitment to the goal of accession and its determination to carry out the necessary reforms and also the EU's fair treatment and support of Turkey in its bid for full membership. Now it is a crucial time for the Turkish government and European leaders to demonstrate serious and sincere leadership to complete this journey for reaching a common destination, which would benefit both sides.

CONCEPTUAL THEORY—“8 L” APPROACH OF MARKETING MIX IN GLOBAL SCENARIO

Devadatta Ranade P .S .College -Pune University, Maharashtra –India

ABSTRACT

Marketing Mix is referred to the appointment of efforts, the combination, the designing, the integration of elements of marketing into a program or mix which on the basis of an appraisal of the market force will achieve the market objectives of an enterprise in a given time.

JEL: M31, L10, L19

KEYWORDS: Mix, Product Life Cycle, Users’ Life Span, Learning, Logo, Linking, Look, Logic logistics

INTRODUCTION

The initial 4 P’s (Product, Price, Place and Promotion) along with the additional 3 P’s (People, Process, Physical Evidence), no doubt, played an important role in establishing the marketing mix concept useful and practical for global enterprises. Moreover, 4 C’s (Customer solution, Customer cost, Customer convenience, Customer communication) also consider about the aspect of consumers. These approaches stressed prime consideration to marketer and secondary consideration to user. Global markets have changed entire scenario of marketing of products, services and even ideas about concepts of all traditional thinking. To make customers feel that the products are satisfying their needs and wants.” is the aim of launching the products in market. Theories much rely upon the point of view of manufacturers, though it has been said that the marketing mix concept expresses independence of production, market and consumer/user. Consideration of consumers, more precisely, users, is not much weighted as a simultaneous part of marketing mix activities. Considering the mix elements, 8 L -conceptual theory can be a new approach in addition to the previous, which simultaneously emphasizes consideration of both factors of market as Manufacturer/Marketer and Customer/User. “8 L” Theory develops this concept with equal balance between manufacturer/marketer and user as combined part of market mechanism. Considering marketing mix –Simultaneous Thinking -about “Marketers & Users”- should be developed as two sides of a single coin for coping up with modern marketing mix in global scenario. There are “8 L” s to be considered as a conceptual theory as-

LITERATURE REVIEW

Life- Span

This considers both –Product Life Cycle as well as Users’ Life-Span. At this point, it should be noted that concept of Product Life Cycle (PLC) is a tool that applies to an individual mark, but a generic product category (cars, televisions, microprocessors, etc) (Luo). Users’ Life Span (ULS) is the psychological period of time for decisive purchasing of a particular product. When the time span of both -the product and the users -matches each other, then only the decision of purchasing a particular product will be materialized. Therefore, one of the crucial tasks that marketers require to perform is-“To identify the stage that is going through the generic category of the product.” Then he has to plan what will be done to address the risks posed by each stage, while taking advantage of the opportunities offered. At the same time, the decision of user to purchase must be kept intact. As there are various new innovative products, there is a time lag between thinking and execution. This can be called as Users’ Life Span. When the user

considers purchasing, it is not possible that he immediately purchases the product. When he actually purchases the product, it may happen that he may purchase some other product than the previous one. Ultimately the users' life span of purchasing the product expires during the time lag of decision and execution. Life span is the key factor which must be considered within the limitations of PLC and ULS. When the product begins to be accepted in the market it begins to grow sales and profits also. This is because the manufacturing costs per unit are reduced, either by increased production experience or by a greater production volume (Karniouchina, Uslay & Erenburg).

The product life cycle is a concept of great importance in the process of marketing any product, because the behavior of the market situation and competitive environment change over time in which the product is marketed. These changes affect the development of marketing strategy. Every product has a biological evolution as embodied in a series of sequential steps (Luan & Sudhir). Similarly each user has own psychological time limit to be associated with the decision of buying a particular product. The Product Life Cycle is time path that runs from product launching in market until it disappears from market. The Users' Life Span is also time path that runs from an idea to purchase a particular product until he really pays an amount to purchase the same.

The life cycle stages are classified into 4 sections: Introduction, Growth, Maturity and Decline. The life span of user also has 4 sections: Idea, Thinking, Decision and Purchasing. The life span of a product class is the longer, while the mark is shortest. What characterizes the life span is the evolution of sales and profits, rising at first, gradually decreasing thereafter. The duration of the phases of the life span is not stable. The adoption process, which sets the tone for the early stages of product life span, can be altered by the emergence of new alternative products, consumer habits and marketing strategies followed by firms competing in the market. Furthermore, it has been found that the behavior of the sales of the most recent innovations shows a progressive shortening of the life span, particularly of the phases of growth and product introduction. Quality improvement may increase the duration, reliability or security product or the consumer durable nutrient capacity, etc (Corstjens, Umbljjs & Wang). But an increase in quality is, generally, an increase of cost that the consumer is only willing to pay if he receives or product improvement is more demanding and appreciates quality. An improvement in the characteristics or performance of the product increases its usefulness, performance, safety or comfort. The change in product design or style of product enhances its appeal.

Among the strategies focused on changing patterns of market behavior according to marketer fit the following:

1. Promote increased use of the product among the regulars,
2. Develop a more varied use of the product among the most frequent users,
3. Create new users of the product to expand the market,
4. Finding new uses for the commodity (Möller)

Similarly, this strategy, as a part of users' aspect, should be considered along with –

1. Develop an idea about the requirement of the product in users' mind.
2. Motivate thinking process about the utility and necessitate of the product
3. Psychological preparation of confirming buying decision of the same

4. Availability of the product within the geographical and economic reach

When we say a product is in its growth stage or another, we are referring implicitly to its link with a particular market. That is, a product can receive a good acceptance (growth stage or maturity) in some markets but found in the introduction stage in others. Thus, microwave ovens were in the stage of maturity in the markets of airline catering and in plants, although they were still at the stage of introduction in almost all consumer markets. In short, the product life cycle and users' life span are the set of stages (Introduction, Growth, Maturity and Decline as well as (Idea, Thinking, Decision and Purchasing) being experienced by a generic category of products, and whose concepts are used as a tool of marketing to know and track the stage where there is a particular product, in order, to identify in advance the risks and opportunities of each stage to a particular brand. A key to successfully managing the Life Span is:

- 1) Predict how the proposed span of the product even before it is introduced and then, at each stage, and Generate the awareness in users about buying the products as soon as they are launched.
- 2) Provide for the needs of marketing in the next step and motivate the users to feel necessitates of the products with a feel of need and pride satisfying their psychology.

Learning

In modern world of knowledge, users are well aware about the knowhow and utility of products and services. In addition to user's own finding, Learning should provide him a new impression. The broad spectrum of issues affecting the consumer highlights the need to define not only the communication pathways or channels through which to inform and educate the consumer population, which would remain an issue unrelated to other elements that comprise the communication processes. It also involves the determination of the consumer perception on the subject. The elements of the external processes of communication should provide consumers with the relevant data for decision making on each product or service so that they can be well informed before purchasing (Hanssens)

It is necessary to work towards a communication management in consumer perception that is interactive, where the consumer can become not only recipient but on the issuer of its own messages, from the knowledge we have about the needs, motivations, delving into the issues they want addressed in the messages- which way?, through what channels? Users expect to establish a feedback loop that allows the fusion of the elements of the process. This benefits both -users and suppliers. This process can be generated through well-designed messages, short with clear language that will encourage consumer identification with the subject (Brooks & Simkin).

This way of seeing the same process establishes conditions for those involved in it, while precisely the relationship and influence that the environment is the setting that has on it, and social practices that are inserted and to which it is based. Another important issue involved in it is "protection of consumers' right". When your organization violates the rights of consumers is already a fait accompli and preventive control, many times is left behind, for which would be beneficial to provide information on legislation or regulations as both consumers and suppliers. Managing communication and consumer protection functions as keystones in organizational strategies, communication processes in consumer protection, should be treated from the domestic, or the generation communication providers. How it flows the internal messages the organization to which they belong? How they get guidance? To what extent the same are for the benefit of consumers? What purposes are to establish communication? If it really has its point of care in respect of the rights and responsibility have for social consumers? (Tihanyi, et. al.). These are the important issues to protect consumers' rights.

Through internal communication management can facilitate the deployment of the entire communications apparatus for providers in order to:

- Promote communication between them.
- Facilitate integration between personal and institutional achievements
- Reduce the sources of internal conflict by strengthening the cohesion of the members.
- Contribute to the creation of spaces for information, participation and opinion

How to generate internal communication processes in organizations is the perception to consumers, it should stop at this point; it can be defining to avoid violation of consumer psychological perception.

This way of seeing the same process establishes conditions for those involved in it while precisely the relationship and influence that the environment is the setting that has on it, and social practices that are inserted and to which it is based.

Look

Look is not just the form but all that the product that we perceive through the senses. Appearance is all it is only in certain products is a disaster and in others it is very well made. Well taken into account in every detail. That's the difference. Look is present in any product. The anthropometry is the study of human dimensions. Studying user-specific percentiles of your product, you can get the human dimensions mean a statistically average customer of its potential. The appearance must be one of the most used as an excuse to sell, as a sales tool, especially for marketers. The appearance is mentioned, despite being so absent in the products. Very few people in the scene of the design are clear about what is appearance. Mention it, promote it, revere it, but do not know. (Osinga, Leeftang & Wieringa) Some examples include: Consider the size of the hands of people in certain age bans to design a cell phone (Fischer & Albers). Define visual field location of windows and decorated in a shop. Dimensions of users to evaluate the design of transport vehicles. There are many possibilities. Find out in technical libraries, where books get specific topic. Make sure the models taken as a reference in the literature models are appropriate to their users.

It includes a comprehensive analysis, looking at the historical evolution of the product and the study of the current trend of fashion and styles present in the market. Evaluate the type of shape, if laminar or linear volume is also important. Defines use situations. Based on these usage scenarios, decide if there are problems caused by the volume or the distribution of volumes in the studied object. Look relates with psychological mind set up activities of user, till he confirms the particular product to be purchased and converts his decision into reality of buying the same. In addition to utility of the product, look & get-up of the product, attracts the minds of the customer. This makes them buy a particular product instead of other one. The perception of different classes & segments of users are absolutely different. This is key factor in modern mix.

Logo: Consumers'/Users' feelings about standard of living are associated with Logo or Display of the product which gives users a pride of their selection. It should not only give an impression of the reliability of product, but user's Psychological association is attached with labels. Slight difference makes adverse impact on the sales because users are habitual to indentify the product of his choice just by label. A well designed logo must fulfill three key conditions must be appropriate, aesthetically pleasing and reflect the credibility of that company. Nice, that is acceptable without visual complications, as the single most important thing to consider when designing is visual perception. Credibility: that people identify with the logo and the hallmark of this company to produce the confidence of the people in the product (Osinga,

Leeflang & Wieringa). A well designed logo is the card of any business: when someone sees the logo of companies like American Airlines, Microsoft, Toyota, etc. not give rise to conjectures about the kind of company they are, or their activities. When a company has a high quality product immediately creates demand within the consumer population. Consumers therefore seek the logo of the product or the production company that buys items to ensure the brand you organization are buying. So we see companies like Benetton, Nike, Reebok, etc. who worry that their logo is in the commercials, so they are familiar to consumers and they in turn seek these seals on their goods.

The logo presents and represents companies in the eyes of the public. A company without a logo is a company that does not exist. Therefore, the design of a logo should be a priority for any company that wants a presence in the market (Osinga, Leeflang & Wieringa). The recognition of a company is the only way that this is known to the public, the only way in which people, potential clients have a reference point, a symbol that tells you organization is there a company that sells such or that, which has a number of specific characteristics. Many companies believe that what is important to market success is to have good quality products, original products and have the best and most prestigious professionals in their field, and this is certainly true, but only true if there is a good logo design to submit to this company as a company with good quality products, original or the best professionals.

Without a proper logo, everything a company strive to be the best will dissolve in the vastness of the market: without a logo that says here we are, we are the best no one will ever know, all the effort that the company has to be efficient will be in vain, if this cannot be recognized by potential customers.

Due to the increasing need for identification by the companies through logos and branding, creating a visual identity strategy is no longer the exclusive domain of large multinationals to become part of the basic pillars of the business plan when creating any entity or brand. Every product or new company that emerges now requires at least a logo or logo that identifies graphically as a basic resource to its competitors, customers, users, or the target audience, among others.

Each communication problem involves a specific solution for companies there are many different ways to solve the particular needs of communication in the global market today. Designed formats corporate style manuals, normalized ratio guide lines for such uniform implementation of the corporative image, logos and trademarks on media such as corporate stationery, mobile park, labels, merchandising, etc (Osinga, Leeflang & Wieringa). Currently, there are many companies that at the time of its creation did not take into account how they would address their corporate communication. This is one of the reasons that companies make their redesigns of logos and logos. The choice of the colors of the logo that identifies a business is always difficult because it involves the impact this will have on society. Some colors are the most contested while others are not even considered because of the negative connotations they have in various parts of the world. The color is considered a sign nonverbal essential to attract the attention of people and make a design be recorded in his memoirs. It was also found its application in logos has important implications for society depending on culture, age, gender, and other factors. For this reason, the choice must be made based on:

- The effects generated in the various sectors of the population
- The style and nature of the business
- The application of the logo on different surfaces and sizes.
- The color appearance on pictures

However, it is advisable to use many colors as the image should be simple. In this regard, there has been research on the meaning and value addition of three plaintiffs in the marketing colors: yellow, red and blue. This color is often accompanied by others to possibly attract public attention. Promote products expensive, prestigious or specific men should not use the yellow as it is considered too flashy. In contrast, there are large successful companies who have used it as his badge, in the case of McDonald's and Shell, Kodak and Lay's, which chose the famous combination of yellow and red. In marketing, the blue is associated with cleaning products, airlines, airports, air conditioners or cold products because of their close link with the sky or air (Osinga, Leeftang & Wieringa).

Moreover, it gives an idea of technology and that is why brands Dell, DirecTV use it as your personal brand. It is very memorable as a great virtue. The red highlights profiles and attracts the eye because of their status as strong color, always produces a positive statement about the product. Coca Cola, Marlboro and Levi's are clear paradigms of success than a logo - and all elements thereof - can lead to a great brand to stand as a symbol of experience and confidence. Living in a world with a substantial diversity of cultures, the choice of color should be careful if you organization are seeking as a global brand. In different places, each color sends a distinct message to the people they expect to arrive. For example, in Mexico the yellow represents the revolution in India is associated with nationalism and New York with the taxis. In conclusion, to associate a color with a mark must be taken into account the main focus of it and the group for which you organization want to run, it is also a plus for the significance of the logo and should be considered which would render it in memory of each individual.

The familiar phrase the first impression is what counts is no stranger to the world of business, and the first image that your customer perceives (its logo), will be the starting point for future transactions you organization make with it. There are several conditions that must meet a well-designed logo, and reflect the personality of the company, professionalism, support, be visually pleasing, easy to remember and be addressed to the target market you organization want to reach, transmitting in a memorable and simple essence of your business. Keep in mind that a logo is more complex, difficult to identify and memorize, because the excessive detail and ornate creations, distract public attention and often does not transmit anything. Is to introduce a company to provide services or to launch a product, the logo must penetrate the mind of the customer and must report as a sign by an icon or a word, what your company is and does.

Designing a good logo is one of the most challenging tasks for any professional designer, and summarizes the work of a product or service on some lines requires more than skill or perception. Some of the factors that surround the creation of a logo are: goal analysis, market profile and character of the company, but more important is the extensive communication, understanding, skills and overall experience of the designer to include and translate these concepts in a balanced design and aesthetic (Osinga, Leeftang & Wieringa). The logo is the basis for building a business profile, the heart of a corporate identity (which should be uniform) and is the great incentive to the public when deciding which product / service purchased. Also, the logo should be a sign consistent with the idea it represents

Logic: Marketers must identify who makes the purchasing decision, the type of decision in question and the stages or steps in the purchase decision process (Luan & Sudhir). And when it comes to marketers you may also pass, you can imagine a large company where there is a specific department dedicated to marketing actions. However, from now on when it comes to marketers and considering that this magazine is aimed particularly at SMEs we associate this figure with whom he plays that role in our business. Even in a small business is a person engaged in the business side, many times even the owner (Lehtinen). Another aspect to consider is that generally when talking about a buy/sell this action is associated with the marketing of a product, and we believe that if we sell a service this analysis cannot be done. Perhaps the simplest answer to this is that there is an increasingly accepted philosophy that does not sell products but also services, every day it gets easier a company to copy exactly the product of their competition, so the difference significant can be achieved with the service.

The process of consumer decision making varies by type of purchase decision. The enthusiasm with which the search is undertaken depends on the intensity of the impulse, the initial information that are available, the facility for additional information of value to be granted and the satisfaction you get from it. Usually, the search by the consumer increases as the consumer goes situations limited solution of the problem to solution of the problem extensively. Each source of information plays a role somewhat different to influence the purchase decision. Business information, a reporting function, and personal sources, built legitimacy and / or evaluation. Through gathering information, the consumer knows the brands on the market and its characteristics.

The total set of brands available is called group of knowledge. Some of these brands meet the initial criteria of purchase and integrate the group account (Corstjens, Umbljis & Wang). As it gathers more information, only some brands will remain important alternatives and form the set of alternatives. Therefore, a company must strategize so that your brand is part of the group known prospects, and consideration of alternatives. In regard to sources of consumer information, the marketer must carefully identify and evaluate their relative importance. Evaluation of alternatives: there is no single assessment process using all consumers, or even a consumer in all buying situations (Möller). There are several processes for evaluating the decision. The models most commonly used in the evaluation process by the consumer are cognitively oriented, meaning that consumers are forming product judgments, primarily on conscious and rational basis. The attributes that are relevant to consumers vary depending on the product. Consumers differ in terms of product attributes that they consider relevant or significant. Put more attention on those who will give the benefits they seek. Often, the market for a product can be segmented according to the outstanding attributes for different groups of consumers (Dekimpe, et. al.).

The beliefs of consumers about the brand may vary depending on their experiences and the effect of selective perception, selective distortion and selective retention. It is assumed that the consumer has a utility function for each attribute. This function describes how the consumer expects satisfaction provided by the product varies with the different levels of each attribute (Yu-Jia). The consumer arrives at attitudes (as a judgment or preferences) to alternative brands, through a review process. Model expectations value is one of several possible models to describe how consumers evaluate alternatives. A manufacturer can do several things to influence consumer decisions:

- Change the product.
- Altering beliefs about the brand.
- Altering beliefs about competing brands.
- Altering the important points.
- Call attention to unnoticed features.
- Change the ideals of the consumer.

Purchase decisions: two factors can intervene between purchase intent and purchase decision: The extent that action by another person reduces one's preferred alternative depends on two things: the intensity of the negative attitude of the other person to the alternative preferred by the consumer and consumer motivation to give please the wishes of the other person. The way consumer purchase intent based on factors such as family income expectations, the expected price and the benefits expected from the product (Luo). When the consumer is about to act, he can sprout unexpected situational factors that modify

purchase intent. The consumer's decision to modify, postpone or avoid a purchase decision is heavily influenced by the perceived risk (Karniouchina, Usley & Erenburg). The magnitude of perceived risk varies with the amount of money involved, the degree of uncertainty regarding the nature and level of confidence of the consumer. The marketer must understand the factors that create a sense of risk to consumers, and proportionate information and support to reduce the perceived risk. During the competitive era of marketing, some analytical and psychological logic derived about particular decision of buying, only, will help in confirming the decision of user for a particular product /service

Loyalty: All brands in the world use advertising to create a loving relationship and trust with their consumers. In their recent study Brand Keys Loyalty Leaders 2011, Forbes found that the brands that enjoy greater loyalty are those that have a real influence on the daily life of the person (Ataman, Heerde & Mela). But how can you turn your name into a brand loyalty? In the Forbes list of the big winners were Amazon, Apple, Facebook, Samsung, Zappos, Hyundai and Kindle, everyday brands and are not necessarily cheap or accessible in a global economy that crosses several problems.

According to Brand Trust Barometer agency Edelman, genuine loyalty to a product is achieved through constant communication to show a human face and honest product. In fact, Edelman points out that a trusted brand is both a brand that generates an emotional response (Osinga, Leeftang & Wieringa). The list of the most beloved brands Forbes indicates that 2011 marks not only loved achieve an extreme level of loyalty from consumers, also have a meteoric rise through advertising by word of mouth potentiated by social networks. A recommended brand is easily loved, so your strategy should focus on generating product that emotional connection with your consumer. With social networks has multiplied by thousands the importance of this type of marketing so please remember that your customers are fans that will attract new consumers and defend you in case of crisis. It is essential to achieve a communication to know what attracted customers to the product, how weak and how strong you are and know what to expect from the brand (Fischer & Albers). This is even more important given the importance of reciprocity in social media. Despite the boom of social networks, consumers will not give the first step to start a conversation with your brand. That's why your brand strategy should consider the formation of these spaces through email, voice mail, and social networking accounts to start the conversation.

Brand loyalty is when a brand is one of the most frequent purchase options considered by the consumer (Losada, et. al.). Today's consumer is not loyal to one brand, say, is loyal to several brands, this means that to satisfy a product can make the decision between two or three brands, they all have to look good, be well positioned, but consider the client that are equivalent substitutes and therefore may choose one or the other almost always taking into account the end the momentum, that is giving me this brand today that makes me prefer it to the other, and that answer this in recent memory, in the TV commercial you saw last night, on tasting product that gave the supermarket entrance, in the promotion they are offering that week, etc. Loyalty means that the consumer perceives the brand inside stores a certain superiority in its class, repeats the act of purchase and also tends to recommend this choice to their environment (whether friends or social networks). It combines, therefore, actual behavior, attitude and commitment psychological (cognitive, affective and conative), and a positive attitude on repurchase intention. With this approach, repeated purchase an attachment is added by the brand based on my own opinion the concept of loyalty (Hanssens). In this respect it is very interesting work of Dick and Basu published in 1994 on four levels of loyalty. Their model integrates both brand attitude and repeat itself in the act of purchase.

Thus, these authors establish four quadrants: true loyalty (high commitment and likelihood of purchase) and latent loyalty (high commitment and low probability of purchase) feigned loyalty (low commitment and high probability of purchase), and loyalty exist (under commitment and low probability of purchase) (Tihanyi, et. al.). Buyers have loyalty about a particular manufacturer for technological and social applications. Not only the brand loyalist customers are considered in the concept, but their loyalty must be

rewarded in selling advanced products so that they must feel the sense of appreciation about their loyalty and trust upon a brand name.

LOGISTICS: There are various ways and Medias of transformation of products in the hands of users through new and innovative marketing Medias of providing products and ideas. A distributor of products should have geographically distributed warehouses so as to meet the demand of each consumer centers must provide (Luan & Sudhir). The distance between the centers of consumption with wineries and distance distribution of these to the central warehouse, somehow determine system performance and costs thereof. The organization need to have a tool to evaluate alternatives to size and locate distribution warehouses in a given geographical area. The completion of the work will involve formulating the problem, considering the service quality indicators relevant to monitor. Perform the logical model of the simulator, build the physical model, operate and eventually obtain and analyze the results. The logistic flow has a number of activities to be met, as quickly as possible to meet customer needs (Constantinides). First, the producer must require a warehouse or factory, buy raw materials to the respective vendors and then convert them into finished products. Once completed this process, products are sold to distributors, who are responsible for storing and transporting them to the point of sale. Finally, commercial establishments will work to buy that good, put it in the stands and sell to final consumers.

Just the logistics mission is to place the products following the appropriate parameters of quality and quantity, in order to avoid shortages. However, the problem arises when introduced into the market in resource abundance. The idea is to compensate for this with the greatest possible economy. Avoid complicated processes when producing and distributing the product, the simplicity in the planning of logistics activities is ideal (Ataman, Heerde & Mela). Also, the logistics system must be able to adapt to different circumstances, to changing situations, hence they require flexibility. The organization must also properly coordinate the many diverse activities that integrate, in order to meet market demands immediately. The logistics functions as a cycle in which the producer, distributor and end user up a gear indestructible. If any of them missing, the logistics flow is broken. This is precisely what we must avoid. Its function is to optimize freight, make sure the products are transported in a good way to calculate waiting times and discharge, handling and storage control. The ultimate goal is to reduce logistics inventory levels and optimize the performance of the entire supply chain. In our country, recently companies are finding the importance of logistics (Osinga, Leeftang & Wieringa).

Not only as a competitive strategy, reduce costs and, most importantly, to give excellent customer service, all at reasonable costs. It is important that companies consider our environment for logistics as an integral part of their plans due to issues such as, Customer service and satisfaction, as this aspect should be the cornerstone of marketing strategies. Exposure of the concepts behind the logistic function is a journey throughout the supply chain (service level, order cycle, distribution, storage, manufacture, procurement, purchasing, etc.) (Lehtinen). On the other hand, developing strategic logistics structure needed to achieve the ultimate goals of increasing customer satisfaction, support services and post sales customer, reduce the time lag between ordering and delivery of goods and products, reduce overall costs, increase the quality of the delivery process, reach strategic agreements with customers, carriers, logistics providers and suppliers, using information technologies and improve, with all this, the company's competitive position. Another aspect to be considered as something of vital importance in regard to logistics is the Inventory Management. After defining the prices, the ability to maximize profits in the business for the various participants in the chain, is given by the adjustments in operating costs, and that is where it is necessary to efficiently manage the number and variety of products ie Inventory Management is one of the keys to business success (Constantinides). Inventory management is one of the determining factors in the chain supplier - distributor - consumer.

The professionalization of business, inventory reduction, cost, development time, delivery, and increased service levels are just some of the many benefits that this scheme can give a company. Obviously avoid

losing sales because of lack of goods, which happens too in most Bolivian companies also from the financial point of view, makes better use of funds, freeing up resources for other areas of the organization (Corstjens, Umbljjs & Wang). The Competitive Logistics contributes directly to achieving high levels of customer service and low costs.

The logistics concept is applied in enterprises characterized by playing an integral role in the activities that are related to flow assurance aimed at providing the customer with products and services required at the time that demand, with the quality required and the cost you organization are willing to pay. This does not mean that management logistics management assume each of the above activities, it takes care of coordinating the variables of each to ensure solutions perform according to a rational flow and ensure a high level of customer service with low costs (Möller).. The company must adopt for this purpose a management philosophy and a flat organizational units or network that enables a consistent application of this concept organizational logistics.

Linking: If we establish a good verbal communication and build a good image of our company to use the language should be formal but friendly, colloquial but not vulgar. When we propose that the language of communication with customers should be formal, colloquial, we say that we should talk to the client with terms that I understand, that make you organization familiar with the language we are using, you organization d trust in the relationship. The jargon, complex words understood by the client, the terms that do not are known as pondrn on the defensive and distrustful (Dekimpe, et. Al).

If we want to give a good image to our customers and suppliers cannot ignore her body language, dress, gestures, smiling, front view and attitude of constant kindness in our ways of communicating, an speechless. Even the furniture and the building structure of the company ESTN communicating something to our customers. A broken chair, a messy desk, a stained carpet or the dim light of the offices they ESTN sending a message to customers. We should note that everything that happens at the level of verbal communication extra be interpreted by the client. That is, when a person receives a message without words tends to make sense of and interpret According to subjective criteria (Yu-Jia). The client side of the line, the operator perceives is doing something else besides listening, so if it starts to interpret what he sees. The client understands that the operator not is listening attentively and beginning to bother. Apart and above after sales services, if there is a continuous dialogue, it will enable a proper linking between manufacturer/ marketer and user. Various ways of dialogue is a proper action taken simultaneously by both indicators of market as marketer and user.

SECURITIZATION AND ITS IMPLICATIONS FOR THE MANAGEMENT OF NPAs IN THE INDIAN PUBLIC SECTOR BANKS

Seema Mahlawat, Shri Baba Mastnath University Asthal Bohar Rohtak

Pooja Vyas, Shri Baba Mastnath University Asthal Bohar Rohtak

ABSTRACT

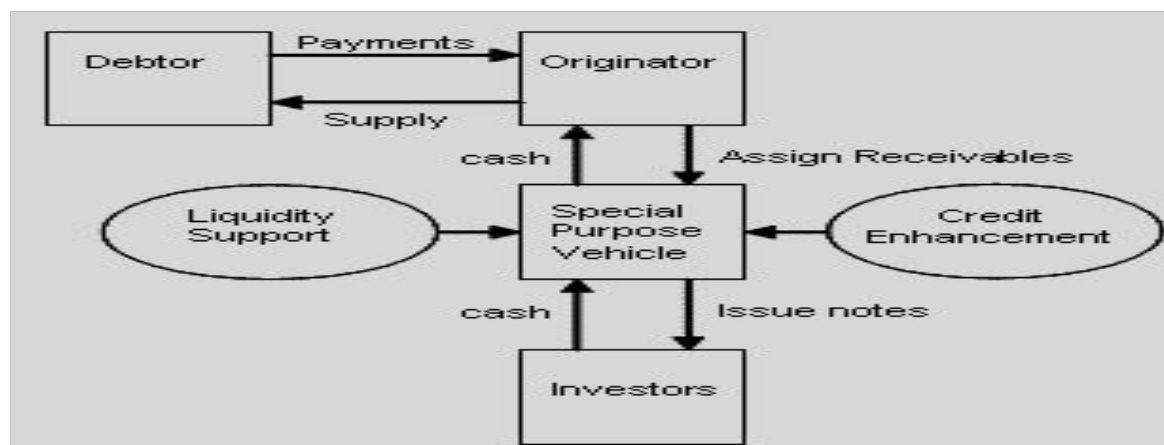

Securitization is undoubtedly one of the most significant innovations of financial world of the modern time which started with the structured financing of mortgage pools in the 1970s. Having made its debut about 4 decades ago in mortgage markets in the USA, securitization is a USD 5 trillion worth business in global markets. India began securitization early among Asian markets, with transactions going back to the early 1990s. And its growth accelerated from 2000, reaching INR580 billion in fiscal 2007-08. Securitization creates liquidity in the market against assets which are generally sleeping or dormant in character and opportunities for investment to people who want to invest to augment income, assured securities having opportunity for encashment as and when required. Securitisation is one way in which companies might go about financing their assets and improving capital returns, raising finances, diversifying portfolios, lowering risk & Managing Mortgage Assets. The present research is mainly of quantitative nature with the exploratory Research design & non probability convenient sampling. For analysis and interpretation both simple and advanced statistical tools with 60 bank branches from public sector (SBI Group and Nationalized Banks) located in Delhi, Haryana and Punjab were selected as sample.

KEY WORDS: Securitization, NPA, Banking, Public Sector

INTRODUCTION

Securitization is the process of converting homogeneous illiquid financial assets/ loans into marketable securities. Under the securitization process, pool of illiquid bilateral loans is converted into marketable securities. Mr. Joel Telpner has briefly defined securitization, "Securitization is a financing tool. It involves creating, combining and recombining of assets and securities." It is undoubtedly one of the most significant innovations of financial world of the modern time, started with the structured financing of mortgage pools in the 1970s. Having made its debut about 4 decades ago in mortgage markets in the USA, securitization is a USD 5 trillion worth business in global markets and it continues to remain an attractive alternative source of capital, which could infuse liquidity and boost economic growth in more speedy way in India. Banks are the principal financial intermediaries in India which have made good progress over the last five years, which is evident from several parameters, including annual credit growth, profitability, and trend in gross non-performing assets (NPAs). While the annual rate of credit growth clocked 23% during the last five years, profitability (average Return on Net Worth) was maintained at around 15% during the same period, and gross NPAs fell notably from 3.3% in 2006 to 2.3% in 2011. This enables them to reduce their exposures to particular sectors e.g. Real Estate as may be considered necessary from their business development angle and, simultaneously to ensure cash inflows to deal with liquidity crunch and/or for other business reasons.

Figure 1:

The originator (lender) transfers his financial interest (called an assignment) to an investment vehicle (called a Special Purpose Vehicle or SPV). The SPV, in turn, uses the future cash flows from receivables to issue securities called Pass Through Certificates (PTCs) to investors. If the underlying assets are corporate loans, the instrument is referred as Collateralised debt obligation (CDO) and if the underlying assets are retail loans, the instrument is referred as Mortgage backed securities (MBS – consisting of housing loans) or Assets backed securities (ABS – consisting of other retail loans like auto loans, commercial vehicle loans, etc). In India, the Direct Assignment structure is more prevalent in which there is no intermediate SPV and the transaction is on a bilateral basis between seller and buyer. The credit enhancement is provided to make good any shortfall due to defaults and delinquencies. The stringent regulation of the Reserve Bank of India, conservative origination standards and simple structures ensured the damage caused by sub-prime structures in US, UK and Europe, were not witnessed in the Indian markets.

Overview of Indian Securitization Market

Securitisation is a relatively new concept in India but is gaining ground quite rapidly. CRISIL rated the first securitisation program in India in 1991 when Citibank securitised a pool from its auto loan portfolio and placed the paper with GIC Mutual Fund (a case study of one of Citibank's subsequent deals is discussed later in detail). Since then, securitisation of assets has begun to emerge as a clear option of fund raising by corporate and a few transactions of well-rated companies have taken place in the country. Securitisation market in India slowed down by a further 29% in value terms during FY2011. The number of transactions in FY2011 was almost 20% lower than that in the previous fiscal. Though there was a small decline in retail loan securitisation (both ABS and RMBS), it was the drastic reduction in the LSO1 issuance that contributed to the sharp slowdown in the overall securitisation market. securitisation of individual corporate loans or loan sell-off (LSO)1

As can be seen from figure 4, notwithstanding the decline in both the ABS and RMBS product, the overall share of retail loan securitisation increased during FY2011. The average deal size was lower in FY2011, mainly due to the greater share of the microfinance loan pools.

The securitisation market in India continues to be dominated by the 'direct or bilateral assignment' of retail loan pools, i.e., direct sale of a selected loan pool by the 'Originator' to the 'Purchaser' (or Assignee) together with limited credit support, as against securitisation which involves the sale of receivables to a special purpose vehicle (SPV) and issuance of Pass Through Certificates (PTCs) by the

SPV. During FY2009 and FY2010 as well as in FY2011, about 80% of the total number of ABS and RMBS transactions has been in the nature of direct assignment transactions, wherein no specific instrument was issued even as the assignee payout were rated.

REVIEW OF LITERATURE

The NPAs are considered as an important parameter to judge the performance and financial health of banks. The level of NPAs is one of the drivers of financial stability and growth of the banking sector (Vallabh *et al*, 2007). Dharmalingam Venugopal stated that The main debate of the defaulters was that the SARFAESI Act was one-sided and had vested the banks and the financial institutions with arbitrary powers in dealing with defaulters; that the Act did not take into account lender's liability and provide safeguards against irresponsible action by the lenders; and that the conditions under which an appeal was allowed were too stiff and unfair. A Fair Practices Code with regard to lender's liability has since been introduced. Mr. Sumant Batra opined that till recent past, corporate borrowers even after defaulting continuously never had any real fear of bank taking any action to recover their dues despite the fact that their entire assets were hypothecated to the banks. This is because there was no legal Act framed to safeguard the real interest of banks. With the legislatures having given their mind in enforcement of security, the sun probably would shine on the NPAs-ridden Indian banks. Enactment of SARFESI Act, 2002 is evident for this drawing this assumption. This paper pointed out that while NPA cannot be eliminated, but can only be contained, it has to be done not at a heavy cost of provisioning and increasing the portfolio of credit. Along with recovery fresh inflow of NPA should be brought down at a level much

less than the quantum of its exit. If this specific goal is reached, there is an eventual solution for this problem.

OBJECTIVES OF THE STUDY

- To study the concept of securitization and its implication in Indian public sector banks
- To Study the impact of Securitization Act in reducing the problem of NPAs in the Indian public sector banks.
- To suggest the strategies to strengthen the Indian securitization market for managing the problem of NPAs' in Indian public sector banks

RESEARCH METHODOLOGY

The present research is mainly of quantitative nature. The Research design is exploratory design. Since the scope of the study is very vast, the present study also represents some characteristics of descriptive research design. Sampling Technique used in the study is non probability convenient sampling. For analysis and interpretation both simple and advanced statistical tools: non- parametric statistical tests based on Chi-square test and five point Likert scale has also been used to measure the intensity of the respondents attitudes towards the selected attributes. A well structured questionnaire was prepared and the responses were recorded analysed and interpreted to reach to conclusions.

FINDINGS:

Research deals with the number of factors considered early warning signals of accounts in the selected banks. To study these factors various parameters were developed by the researchers The responses to these parameters were collected. 'irregular payment' is highly reported warning signals of accounts turning into NPAs in Indian public sector banks, followed by the 'No operation in Account' and 'Income generation from projects no as per the plans. But the least important warning signals are the 'frequent return of checks' and any others. Various suggestions for improving the effectiveness of securitization and NPAs recoveries. To study the possible suggestions, various parameters were developed and responses to these parameters were collected.

Securitization effort will call for considerable investments in time and resources. Hence, on a comparative cost scale it can even be somewhat more expensive than other types of debt financing that may be available to a borrower, at least in the initial stages. However, it has been demonstrated that a continuing securitization program rather than a single deal often goes to reduce the costs, as economies of scale and expertise pick up over a period of time. Bearing this in mind, many securitization programs are run with a long-term strategic perspective.

The ranking of the mean score three parameters were identified which were the most important suggestions to control the problem of NPAs in the banks. These were: (1) Good pre-sanction scrutiny. (2) Need based financing. (3) Effective post sanctions supervision. It is also found that branches to have adequate manpower for follow up/supervision of advances were not the appropriate suggestion to control the problems of NPAs in the banks of India.

Being distinct and different from the originator's own obligations, a well structured ABS stands on its own credit rating and thus generates genuine incremental funding. This is so as the originator's existing creditors may invest in the ABS in addition to providing lines of credit to the originator. Further, there may also be other investors in the ABS who do not have a lending relationship with the originator. It is also possible to achieve a superior credit rating for the ABS than the originator's own through appropriate

structuring and credit enhancement. This could mean accessing an investor base focusing on high grades, which otherwise may not be possible for an originator.

To study the impact of Securitization Act the respondents were asked to give their opinion whether they are agreed or not or cannot say anything. Responses to these opinions were gathered results depict that Securitization Act has impact on reducing the level of NPAs in the selected public sector banks. Very few respondents reported that Securitization has no impact on NPAs. .

Balance Sheet Management

Fundamental benefit of a true sale, i.e., freeing up the capital of the originator would apply in the case of all securitization transactions. In response, the balance sheet gets compressed and becomes more robust. Its ratios improve. Alternately, reduction in leverage post-securitized sale can be restored by adding on new assets to the balance sheet. Thus the asset through-put of the originator's balance sheet increases. Securitization can also generate matched funding for balance sheet assets. Further, it may also enable the disposal of non-core assets through suitable structuring.

Results indicates that 38.33 percent respondents were highly satisfied whereas 23.33 percent respondents were satisfied, 16.67 percent respondents reported their poor satisfaction level whereas 21.67 percent respondents reported their dissatisfaction level. So results show that most of the respondents are highly satisfied with the present public or judicial auction procedure. However, the difference between the satisfaction and dissatisfaction level is not very significant. This indicates that there is still scope for improvement in the present public or judicial auction procedures.

Results are indicating that highest 43.33 per cent respondents reported that Recovery was done through SARFAESI Act, followed by other parameters and SARFAESI Act has been found major instrument of NPAs recovery in the Indian public sector banks followed by DRTs and Lok Adalats. Compromise scheme and one time settlement scheme has been found least effective in regards to recovery of NPAs in the Indian public sector banks.

Securitization transfers much of the credit risk in the portfolio to the ABS investors and helps to quantify the residual credit risk that the originator is exposed to this is very useful, as the originator can then take larger exposure to individual obligors as well as provide a higher degree of comfort to his creditors. Securitization also transfers the originator's market risks, i.e., liquidity, interest rate and prepayment risks, to ABS investors and reduces risk capital requirement. This can lead to more competitive pricing of the underlying asset products.

Operating Process Efficiency

The extent of portfolio analysis and information demanded by securitization programs often lead to serious re-examination and consequent re-engineering of operating processes within the originator organisation. Further, specialist handling of various functional components, such as origination, funding, risk management and administration, often achieved through outsourcing, promotes efficiency across operating processes.

Globally, over the past two decades, banks have lost their traditional role as the dominant suppliers of credit in some countries, and securitisation has become a core component of the market-based supply of credit. While corporate bonds served as the main intermediated financing tool for non-financial corporations, securitisation acted as the main capital market instrument for household finance, and to a lesser degree SMEs. Post crisis, however, many of the pitfalls of the securitisation market have come to the fore. Securitisation per se has not been discredited totally though the new normal for securitisation markets is expected to be lower than its pre-crisis peak.

The Way Ahead The stable trends in the securitisation markets could receive a further push through the resolution of certain issues as discussed below. Release of final guidelines would support market growth:

The issuance of the final guidelines will provide stability and direction to the market. Several market participants who have preferred to await the final guidelines will be emboldened to enter the market again. Clarification on pending issues in the draft guidelines could eliminate ambiguities: There are several pending issues in the guidelines, which could be finalised to confirm on the final rules of the game. Three crucial unresolved matters include:

Conventional or prospective: A retrospective implementation of the guidelines could shave off significant capital from several bank balance sheets. The implementation of the guidelines could be prospective in nature, as this will allow the market to migrate to the new regime in a phased manner, and signal a stable policy framework.

Differential capital treatment between first and second loss credit enhancements: The present guidelines make no differentiation between first and second loss credit enhancements. Given the differential levels of protection to first and second loss, the second loss could be provided a definitive capital benefit vis-à-vis first loss.

• *Capital allocation pre and post securitisation:* The capital allocation on a securitisation transaction may be capped by the capital requirement on the assets on a pre securitisation basis. The originator's capital requirements post securitisation cannot be higher than the capital requirements pre securitisation. Put differently, the capital allocation on a securitisation transaction cannot be higher than the capital allocated if the asset remained on the originator's books, as the mere process of securitisation may not add to risk.

• *Separate guidelines on direct assignment transactions will be a welcome step:* Despite constituting a large component of the market, bilateral direct assignment transactions are presently not under the purview of the guidelines. Most large banks and financial institutions have been actively using this route (both rated and unrated). A separate guideline for such transactions (akin to that released for securitisation) would create a transparent public market for such transactions with the necessary checks and balances.

Finality on these and other pending issues would signal a stable policy framework to the market place at large, and enable the building of a healthy and vibrant securitisation market.

Some other suggestions that came out from various respondents to improve the Indian securitisation market are as follows-

1. *Standardization of securitization documentation:* This will help build the investor confidence and enable informed and quick decision making.

2. *Need for Market maker :* The regulations prohibits Originator from indulging in market making or dealing in the securities issued by the SPV. As a result there are no two way quotes available. To improve liquidity, the regulators may consider allowing originators to act as Market Maker at least to a limited extent.

3. *Need for more asset classes :* Most of the transaction currently involves car loans, commercial vehicle loans, construction equipment loans etc. Recently microfinance and gold loans have also been securitised. More asset classes like infrastructure receivables, credit card receivables, inventory receivables etc. need to be securitised to create wider base of market participants. In India, banks have to meet priority sector obligations and all banks may not have the infrastructure to lend to the priority structure. In such cases acquiring a microfinance portfolio through securitization may be a viable alternative to such banks.

4. *Increasing the disclosures:* There is a need for availability of industry wide asset class performance data to enhance investor confidence. For this purpose one needs to collect asset-wise performance data from originators like Banks, NBFCs and HFCs and collate it to arrive at industry wide benchmarks. Regulators need to enable such initiative. Investors should have easy access to default as well as fraud

data across all assets. This will enable investors to know about a particular asset class behaviour and see the trends across products. This will help the investors to take informed decisions and position themselves across risk profiles. This will improve investor confidence.

CONCLUSION

Non Performing Assets have emerged as uncontrolled virus, over the years posing an alarming threat to banking industry in our country. The emergence has been sending distressing signals of on the sustainability and endurability of affected banks. The recurring problem of NPAs is simply one of the inheritances. Despite the global crisis, securitisation market in India performed well with no reported defaults till date. Securitization has been proven the most effective tool for the NPAs management.

AUTHOR’S PROFILE

Dr. Seema Mahlawat is Professor at SBM Institute of Management Studies and Research, Asthal Bohar, Rohtak (Haryana) India. She is Doctorate with thesis pertaining to Securitization in Banking. She has done her Masters in Philosophy from CDLU, Sirsa and Masters in Commerce from Maharshi Dayanand University, Rohtak. She has also successfully completed Post Graduate Diploma in Business Administration with dual specialization in Marketing and HR. She has to her credit 8 years of post-graduate management teaching and industry experience along with three years of marketing experience. In her career span she has published 15 research papers in leading journals of national and international repute. Apart from this she has contributed about 21 papers in national & international conferences and seminars. Her work has been accepted for presentation in many countries: USA, Australia, Malaysia & UK. Her two books on Research Methodology & Strategic Cost Management & Control are under publication. She is chief editor ‘**Sandesh**’, ‘**Mastnath Journal of Management**’. She has teaching and research interests in Banking and Finance, Product Market strategy, Services Marketing, Research Methodology, Rural Marketing, Managing Talents, Organizational Behaviour. She can be contacted at +919996140403 or at seema_vision11@indiatimes.com, Or seema.aryan@gmail.com Address: Dr Seema Mahlawat, House No 666, Sector 1 HUDA Rohtak, 124001 Haryana ,India

CUSTOMS UNIONS OF COMMODITY-EXPORTING COUNTRIES: AN ANSWER TO SOME CHALLENGES OF GLOBALIZATION?

Vladimir Sherov-Ignatyev, Saint Petersburg State University

ABSTRACT

The paper is devoted to the contradictory implications of economic globalization and to the role of customs unions (CU) in smoothing negative implications of “shock liberalization”. The case of CU RBK (Russia-Belarus-Kazakhstan) is discussed and compared with similar asymmetric South-South CU with commodity-exporting members in South America, Arabian Peninsula and South Africa.

KEYWORDS: liberalization, disparity, resource curse, customs union, Russia.

INTRODUCTION

Theory and empirical data suggest mostly positive influence of trade liberalization and global integration on economic growth. The per capita income gap between North and South is narrowing, and progress in addressing pressing social problems of the Third World is visible. On the other hand, there are numerous indications of increasing disparities among social, ethnic groups and geographical regions within countries with dynamic economies. Economic growth is usually uneven. Rapid trade liberalization and North-South integration tends to aggravate social and regional disparities. The objective of the study is to check the ability of South-South regionalization in the form of customs unions to alleviate negative consequences of globalization for commodity exporting countries.

LITERATURE

Simon Kuznets (1955) has shown that economic development first tends to increase inequality, and then to reduce it. This dependence is called the Kuznets curve. Economic growth does not equally involve all social and ethnic groups and geographical areas of the country. Certain sectors of the economy grow faster than others, and revenues are growing rapidly in parts of the country, where fast-growing production is located. Empirical data illustrating the trend to social differentiation during trade liberalization is widely spread. The team of World Bank experts explored social dynamics in Egypt on the eve of the Arab spring and found that substantial part of Egyptian population improved their conditions during the period of growth in 2005-2008, but great number of people lost part of their incomes (Marotta, 2011). Antoine Bouët brings evidence that up to 46% of Pakistani male population (with low education) loses as the result of foreign trade liberalization, while some 25% with high level of education gain additional incomes (Bouët, 2011). The Kuznets curve gives hope, predicting the weakening of social polarization as incomes rise. It is not the case for geographical polarization. The relative importance of the basic factors of production and competitiveness has changed over the past decade. The newly created factors - infrastructure, availability of educated labor force, capital, -and entrepreneurial activity play much greater role than before. Production and capital often tend to concentrate in large urban agglomerations and not in small peripheral settlements with cheap unskilled labour. This trend has been analyzed, in particular, by Paul Krugman and Anthony Venables (1995) and added to the foundations of the New Economic Geography.

METHODS AND DATA

Our goal is to check validity of kuznets curve nowadays, to examine degree of regional differentiation in Russia and its trends and the role of foreign trade activity in regional development. We use standard regressions and statistical groupings, using data from the World Bank, UNCTAD and Russian statistical committee (Rosstat). After that we discuss customs unions trade and their vulnerability to resource curse, using INTRACEN data. This work-in-progress short version reflects part of results and main conclusions.

Social And Regional Polarization And Economic Growth

Growing external trade supports mainly the development of sea ports, large industrial agglomerations and export-oriented regions. Thus, global integration often leads to gradual disintegration of national economies. This differentiation in the early stages may play a catalytic role, encouraging people to engage in entrepreneurial activity and to study new professions, as well as encouraging people to change their place of residence. However, excessive social and geographic differentiation may instead become a source of diverse and serious problems, objecting further development. Comparison of per capita income and the Gini index for 123 countries around the world (for which information is available on the Gini index over the last decade), gives the expected pattern (Figure 1) at the beginning the 21st century.

Figure 1: Gini index and the per capita income (2009), USD for 123 countries

Calculations based on World Bank data. Gini index values - the latest in 2001-2009.

The Gini coefficient is low in less developed countries with average per capita incomes less than 2 thousand dollars a year and in the most developed countries (the U.S. is an important exception, but even there the value of the Gini index (41) is much lower than in many developing countries). The highest values of the Gini index are found in middle-income countries – USD 3 - 8 thousand per capita incomes (mainly Latin American countries - Brazil, Colombia, Honduras, and others, as well as Thailand, Angola, South Africa).. Further per capita incomes growth stimulates decreasing disparities. With average earnings of more than USD 20 thousand, the Gini index higher than 35 are rare. Multiplied growth, expanding to various layers. At this point, already formed middle class, creates a demand for democratic institutions and these institutions, in turn, provide and finance social programs that provide income equality. Problems are concentrated at the growth stage, when the growing inequality of incomes. It is in the fast-growing states with a middle income that social tensions and political conflicts often arise. Suffice it to mention Iran, late 70s, Mexico, Peru, 80-90s, Thailand, the Philippines, South Africa, and Tunisia and Egypt as the most fresh examples.

Development of Russian Federation during last two decades, after the USSR break-up, adds new evidence of the fairness of the above-mentioned assertion. In early 90-es the country experienced shock liberalization, when export (mostly – of fuel and other mineral resources) grew quickly while manufacturing and GDP collapsed. Moscow, some oil and gas extracting regions and to lesser extent, some regions with metallurgy benefited from such a liberalization, while many other regions suffered from high unemployment and dramatically falling incomes. Many things changed in 20 years, but oil-and-gas export dependence and regional polarization are still there. Regression, based on Russian regional data showed that per capita incomes in Russian regions heavily depend on per capita export of the region (Sutyryn, Sherov, 2005):

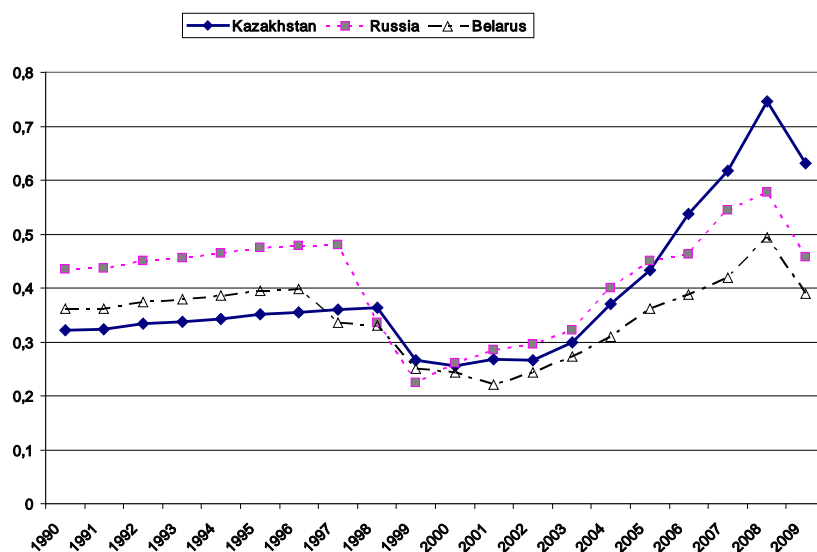

$$\text{INCOMEPC adj} = 1086 + 0,32\text{EXPORTPC} + 1805\text{MOSC}$$

t-stat. (37,8) (9,1) (7,8)

n=78, *R*²=0,75, *F*=94,

where INCOMEPC adj is per capita incomes, adjusted for price difference among regions; EXPORTPC is per capita export; MOSC is a dummy variable for Moscow city. Resource curse in Russia and some other post-soviet countries manifested also in a well known forms: volatility of commodity prices and Dutch disease – a typical challenge of globalization for commodity-exporting developing countries. The Dutch disease, decreases competitiveness of manufacturing sector due to appreciation of local currency. This happened, e.g., in Russia and Kazakhstan, where price levels fluctuate in the same direction as oil prices (figure 2).

Figure 2: Relative price levels in RBK, 1990-2009 (PPP/standard market conversion rate)

Calculations based on World Bank data.

Customs Unions As An Instrument Of Positive Collective Protectionism

South-South regional integration and trade facilitation in particular gives a chance to mitigate this problem. Improving transportation systems and alleviating border crossing procedures is a way to increase competitiveness of local manufacturing in developing and transition economies with currencies, overvalued due to the Dutch disease. It is interesting to mention that a number of resource-exporting countries have chosen customs unions shape of regional integration. Southern African Customs Union (SACU), Southern Common market (MERCOSUR), Gulf Cooperation Council (GCC), and Customs

Union of Russia, Belarus and Kazakhstan (CU RBK) are among them. Asymmetry (domination of one large country) in these four cases has not become an ultimate obstacle for creating a customs union as it happened in NAFTA or in South Asia free trade agreement (SAFTA) (table 1).

Table 1: Asymmetric Customs Unions: Export by Product Group, 2009, Per Cent

Codes	Product group	Customs Union of Russia, Belarus and Kazakhstan (CU RBK)	Gulf Cooperation Council (GCC)	South African Customs Union (SACU)	MERCOSUR
1-24	Food & agriculture	3,6	1,2	11	40,4
25-27, 71	Minerals	64,8	68,1	39,3	19,1
28-70, 72-96	Manufactured goods	24,3	17,8	49,6	40,0
97-99	Other	7,3	12,8	0	0,5

Calculations based on UNCTAD data.

Customs unions (CU) have a potential advantage in this very field: comprehensive CU with unified custom duties and custom procedures and with working mechanism of import duties collection and redistribution allows eliminating of customs control procedures on mutual borders, which induces additional trade creation and trade diversion effect (Jacob Viner's classical approach to the analysis of regional integration is worth extending to trade facilitation effects). In practice, by the way, most of CUs have not reached this stage of integration so far. Out of about 15 CUs existing today, only 2 have reached the comprehensive stage: European Union and CU of Russia, Belarus and Kazakhstan.

In Russian Federation additional positive effect of regional integration is of special importance due to the fact, that many of Russian regions with low per capita incomes and low degree of engagement in foreign trade are located in the middle of the country, close to the border with Kazakhstan. Russia's WTO accession in 2012 is expected to aggravate the problem of regional disparities even further. Deeper integration with Kazakhstan gives a chance to "Introvert" regions, their manufacturing enterprises becoming able to expand to the neighbour market easier than before. The scale of anticipated effect is serious, since, according to Sergey Glazev, the CEO of CU RBK, border-crossing waiting and procedures constitute up to half of the time of importing goods within the CIS, despite free trade among most of the alliance members (Glazev, 2010).

CONCLUSION

We conclude that CU RBK can smooth some negative consequences of further opening Russia's economy after Russia accedes WTO this year. South-South regional integration in the form of customs unions gives a chance to mitigate this problem: It is a kind of positive collective protectionism, eliminating barriers instead of creating them.

AN EXPLORATORY STUDY INTO THE FACTORS THAT IMPACT ENTREPRENEURSHIP BEHAVIORS IN DEPRESSED ECONOMIES

Sharon Didier

ABSTRACT

This paper measures students' intentions to engage in entrepreneurial behaviors. Schumpeter's (1934) concept of economic development shadows some of the constructs reviewed in the assessment of the factors that may contribute to the overall economic development of depressed economies. The Theory of Planned Behavior is used to group the independent variables for analysis. Socioeconomic, conditional, and personal factors form a solid basis in the review. A pretest was used to measure variables for the study. This resulted in the development of a 5 point Likert-Type scale measuring twenty variables. The paper's focus does not exclusively center on economic theory, but tries to present some considerations in addressing the conditions that impact the overall success of startups in relation to economic and regional development. Primary data is accumulated from four secondary schools, N=351, and the literature is focused on the four categories which form the framework of the study. In support of some of the secondary and primary data, the results indicate that socioeconomic factors show the most impact on the youths' decision to engage in entrepreneurial behavior. Internal factors such as self-awareness, passion and self-confidence also show significance. Future studies should include the impact of culture and religion.

KEYWORDS: Entrepreneurship, Support, Conditional Factors, External Factors

INTRODUCTION

The global recession has left many nations in search of options for economic development. Entrepreneurship has become a viable solution for nations that continue to struggle in an increasingly competitive global economy. The youth can become a powerful force competitively if they are empowered with the tools to pursue entrepreneurship. A review of the factors that may impact that decision is of vital importance. Regional development can be enhanced if strategies that are focused on providing support for entrepreneurial intentions are developed. The next section provides a review of the background and historical context from which the study was performed. The measures that form the basis for the three hypotheses are stated and supported with secondary data.

LITERATURE REVIEW

Numerous secondary sources were reviewed in support of the model that is used to group the 20 independent variables. The conceptual framework is supported by the works of Liebnstein (1966), Baumol (1993), Shane et al. (2003), Zaborowski (2009), Evans and Jovanovic (1989), Banerjee and Newman (1993), Pinto et al. (2011), Russell et al. (2008), Jenssen et al. (2002), Schumpeter (1934), Ram (1994), Hertzberg, (1968), Kohn,(2010) and others. The general sentiment is that social institutions can impact the overall success of entrepreneurship and economic development in a region. The work of Jenssen et al. (2002) and Andersen et al. (2010) support the notion that institutions such as schools, financial entities and the government are important in the analysis of entrepreneurship. Personal factors such as self-confidence, motivation, passion, and self-awareness are discussed in support of Goleman (1989), Ghulam et al. (2010), Mc Nerny (1994), Hertzberg (1968) and Kohn (1993). Conditional factors such as finance, need, opportunity and incentives are discussed in review of Petrov (2007) , Shane et al.

(2003), Evans and Jovanovic (1989) and Banerjee and Newman (1993) . The group called “other factors” was used to determine if they will show some significance in a study on entrepreneurship.

The paper uses extensive literature to develop three hypotheses with a focus on the internal, external and conditional groups used in review of the variables.

METHODOLOGY

Instrument: A 5 point Likert-Type scale measuring twenty independent variables and one dependent variable was used to survey four schools in a densely populated area over a period of 6 months. A similar scale was used by Ross et al. (2007). The surveys were edited and coded in preparing the data for statistical testing. Descriptive statistics, regression, correlation and single factor Anova were used to test the relationships.

Measures: The independent variables were grouped into four categories to determine the strength of their impact on entrepreneurship. Economic theory was used as the basis upon which consideration was given to entrepreneurial intentions for regional development. The Theory of Planned Behavior was used to interpret the significance of the variables as it relates to entrepreneurship. This formed the basis upon which the factors were analyzed. Descriptive Statistics was used to show the frequencies in the responses. Regression was first applied and then multiple regression was used to measure the strength of the groups in the categories ($p < .05$). The correlations provided additional information about the strength of the relationships (± 1). Tables and figures were used to summarize the findings. The variables showing a strong relationship were extensively discussed and supported with the secondary data. The hypotheses were assessed using a t-test and Anova single factor test.

RESULTS AND DISCUSSION

All of the alternate hypotheses were accepted. The independent variables showing the most significance among the four schools were in the external factors group. In addition, a few of the conditional factors had some impact on entrepreneurial intentions. Internal factors such as self-awareness and self-confidence showed strong associations. Passion was also singled out as a significant factor in entrepreneurial success. Two out of the four schools indicated that education was significant when the regression test was applied. The data confirms that there are mitigating factors that exist and, if not addressed, entrepreneurship will not be able to sustain the economic growth of the region. Students are in agreement that there is insufficient opportunity and support for entrepreneurs. As indicated in Figure 1, 80% of the respondents felt that, if they had support, they would open their own business (support). 84% of the respondents believe that people really need to love what they do to be successful in business (passion). 74% of the respondents agreed that if they knew what they were good at, they would not mind opening up their own business (self-awareness)

CONCLUSION

Shane et al. (1997) states that the pursuit of entrepreneurial opportunity is an evolutionary process that includes the evaluation of opportunities, the pursuit of resources, and the design of mechanisms for exploitation in the process of entrepreneurship. Schumpeter (1934) believes that entrepreneurial studies will continue to be in the forefront because it drives innovation and technological change, and subsequent economic growth. The current study has unraveled some of the factors that could encourage entrepreneurial intentions. Further studies need to be conducted to address these concerns if in fact entrepreneurship is considered as a viable option for economic and regional development.

Limitations

The sample N=351 was only limited to graduating seniors at schools in the North. The sample sizes from the different schools were not homogenous. The survey was only distributed to graduating seniors. The students had to respond to the surveys in the allotted time that was provided to them. The students may have been influenced by the presence of their teachers in the lecture room. The closed instrument did not allow students to include independent responses for future review.

Figure 1: Survey Responses

61% of the respondents think that St. Lucia would be doing better economically if more young people had their own business.

80% of the respondents believe that, if someone would help them, they would think about opening up their own business.

77% of the respondents believe that, if they found out what they were good at, they would not mind turning it into a business.

52% of the respondents disagreed that young people are encouraged to open up their own business in St. Lucia.

84% of the respondents believe that people really need to love what they do to be successful in business.

50% of the respondents think that people who are successful have a strong family support.

BIOGRAPHY

Sharon Didier is a Professor in the graduate business school at St. Joseph’s College in New York. She has participated in a number of lecture series on Entrepreneurship in the Caribbean. She is also involved in development projects in the Hotel and Tourism industry in the Caribbean. She is a consultant in marketing and strategy development. She has assisted in the development of a variety of Tourism products regionally. Her research interests are in interdisciplinary themes that include Education, Hospitality, Marketing, Business Research, and Strategy Development. She can be reached at deligny04@yahoo.com.

IMPACT OF CREATIVITY AND INNOVATION OF SMEs ON ECONOMIC GROWTH DEVELOPMENT IN THE KNOWLEDGE SOCIETY IN ROMANIA

Ionica Oncioiu, TOMIS University of Constanta

Florin Razvan Oncioiu, University of Agronomic Sciences and Veterinary Medicine of Bucharest
Romania

ABSTRACT

When the SMEs competitive advantage is based on knowledge as is the case in the knowledge economy, innovation and creativity become a decisive factor in the economic activity because knowledge tends to be developed in the actual contexts. Technical progress leads to innovation waves and creativity stands in the doorway of these phenomena, although it is usually not explicitly associated with it. The purpose of this paper is to analyze the impact of creativity and innovation of the SMEs on economic growth and development. Thereby we will highlight these two phenomena and draw on the available empirical evidence to explain them. In our analysis we will focus on the Romanian SMEs.

INTRODUCTION

The knowledge-based economy is a controversial term which nevertheless describes the important changes to the nature of growth and catch-up that have been taking place at the beginning of the twenty-first century. It has been defined in different ways, all of which highlight the increasing importance of knowledge as a source of growth. Researchers have been interested in innovation and growth for a long time. While macroeconomic regarding the innovation and growth nexus are relatively well developed, our knowledge is still limited about the nature of connection in the firm level. At the same time, much less is written about the majority of small and micro size firms that constitute the core of the economy.

A new business concept is the spark that triggers the innovation process. It on how the novel products or processes may be achieved from the platform of current op cents, that is, products and processes, combined with thoughts or estimates of the market new business concept. The new business concept is conceived from the current state of products and processes in the enterprise, the current markets and a perception of future market opportunities. With the current rapid transformation of markets, enterprises would quickly stagnate and competitive positions without renewing. Such renewal is most often produced by several small adjustments, commonly referred to as incremental, stepwise or gradual innovations. In many cases, incremental innovations are implemented in the course of ordinary operational activities hardly noticed from day to day. However, the cumulative effect of incremental innovations is usually sufficient to maintain a competitive position when changes in markets follow predictable patterns.

There are three concepts regarding policy measures of innovation which can be relevance in the case of Romania:

1. innovation as recombination concept promoted by Schumpeter;
2. innovation without research concept promoted by Cowan and Gert van de Paal;
3. the utilitarian vision of knowledge.

Innovation as recombination is equally economic optimization issue and result is generated from a combination of already known elements or factors. Based only on access to information and on

accumulated experience, innovation without research recombines knowledge in order to optimize the information which is not based on formalized research. The new knowledge is largely based on the old knowledge because the simplest way of stimulating the creation of new knowledge is to make the old knowledge visible. The characteristic of the visibility derives from the close connection between the knowledge content and its interface. A larger visibility reduces the information asymmetry and the associated transaction costs. The Romanian decision factors must understand that externalization of knowledge and its storage in various new knowledge objects create new cognitive potentials.

How to manage such knowledge is one of the competencies required in the knowledge economy. Practical the value of knowledge depends greatly on the cognitive capabilities of the recipients of the knowledge. The technical opportunity to amass and process large amounts of information at very low cost has potentially far-reaching effects on all economic activities. In this context productivity growth in new sectors is an important feature of structural change. Consistency between two major elements is decisive for a successful completion of the SMEs innovation process. The first element is the character of the innovation - what challenges does the innovation present. The second element is the capability of the SMEs to address these inherent challenges, that is, the capacity of the enterprise to muster resources and to act in a sufficiently dynamic way.

REVIEW

The importance of innovation as a key factor of economic growth and development was highlighted by Joseph Schumpeter in his Theory of Economic Development (1912) who considered the entrepreneur's task and capacity to realize new combinations of the production factors, i.e. innovation, as the basis of his theory. The first empirical studies on innovation have taken as a point of departure the investment in R&D by industry or at the country level as a percentage of the GDP and as output the number of patents. These studies hypothesize a positive relationship between investment in R&D and economic growth. For instance, Lichtenberg (1992) and Eaton & Kortum (1993) found that the level of R&D expenditure and the number of scientists and engineers were significant factors for explaining the income level of a country. The link between entrepreneurship and innovation has been established strongly since Joseph Schumpeter. Since then innovation is considered as an essential characteristic of entrepreneurship. The link is emphasized by any textbook on entrepreneurship, even introductory ones, such as for example Zimmerer and Scarborough in its fifth edition (2008): "Entrepreneurs also create innovations to solve problems they observe, often problems they face themselves".

The fundamental issue is the management of innovation processes, which differs from management in general (Salomo & Hölzle, 2007) due to the high level of uncertainty and application of novel competence. However, in discussions on innovation there is a tendency to associate it with large, technologically advanced firms. This was already a sensitive point for Schumpeter, as can be read in the contribution of C. Freeman in the Palgrave dictionary: "Schumpeter (1928 and 1942) is often known for his emphasis of the advantages of large size and monopoly on innovative performance, whilst traditional theory has continued to stress the advantages of competitive market structures".

Business innovation processes require access to new resources, including competence (Bayer & Gann, 2007; Chell & Baines, 2000), which are frequently tapped from external sources. Many therefore consider better access to such external resources to be a vital policy instrument to support the innovative capacity of the business sector, especially for smaller enterprises. The term innovation system (Cooke, 2001) has often been used to describe the interaction between an individual firm, on the one hand, and firms and institutions that can provide such resources on the other hand. Innovation systems have received attention from researchers as well as policy-makers as possible instruments for improving the innovation capacity of enterprises. It is imperative that innovation systems are developed with a thorough understanding of how enterprises utilize external resources in their innovation processes.

During times of dramatic changes in the business environment or when SMEs exploited completely new opportunities, incremental innovations would not provide sufficient le for rapid and large transformations. We refer to these large transitions over a short time period as radical innovations. They are also referred to with terms such as discontinuous or really-new innovate (Garcia & Calantone, 2002; McDermott & O'Connor, 2002). The innovation capacity of an enterprise thus rests on the foundation of its resources, which have been accumulated as a result of previous activities. These resources have been shaped by the needs of the past and are subsequently applied in the current innovation process to respond to the needs of the future. The ability to come up with novel solutions will therefore depend on an ability to adapt the resources in response to the new requirements of the innovation process (Eisenhardt & Martin, 2000; Pekkoo, Mahmood, & Mitchell, 2004; Teece, Pisano, & Shuen, 1997).

Eisenhardt and Martin (2000) define dynamic capability as “...the organizational and strategic routines by which firms achieve new resource configurations as markets emerge, collide, split, evolve, and die.” The dynamic capability is thus the process at the strategic level that enables the enterprise to change the content, structure and organization of the resources that are available to the innovation process. Correspondence between the dynamic capability and the dynamic change patterns of the business environment is essential for the long-term survival of the firm. Therefore, adequate flexibility in its dynamic capability constitutes a significant part of the core competence for a firm’s innovative sustainability. New firm formation is the most important mechanism by which scientific and technological knowledge is converted into economic knowledge that enables the production of new products and services as well as high value added jobs in the knowledge society.

However innovation is not only a matter of product differentiation or product management in general. It refers to all aspects of doing business. Entrepreneurs can be innovative with regard to any aspect of running their business including the production processes, the organization structure, finance management etc. Innovation can be successfully applied in ‘new’ sectors such as high-tech but as well in very ‘traditional sectors in industry, services and even agriculture. It can be successfully applied in new start-ups with an informal business culture but also in existing businesses such as family businesses with a tradition of several generations. Small as well as large businesses can be innovative with regard to their product, their technology, their organization or their financial management.

Creativity stands at the beginning of any research, innovation or new firm formation process. Lee et al. (2002) show that creativity, diversity and human capital have a positive and significant relationship with regional innovation production measured by per capita patent production. And Florida & Gates (2001) found that diversity has a positive association with regional high- tech output and growth. Lee, Florida and Acs’ research (2004) confirms a positive and significant relationship between creativity, diversity, human capital and the rate of new firm formation in a certain territory. Among these three factors creativity is the one that is more strongly correlated with new firm formation rate. The new theory and empirical research in the field of economic geography confirm the importance of agglomeration and the social context in economic growth and development (Krugman, 1991, and Acs & Varga, 2004).

Innovation And Competitiveness In The Romanian Smes

Innovation is a crucial concept involving creativity, organization and profitability but can it be measured? Is it possible to use operational concepts that allow measurement? The creation of new businesses is necessary for the renewal and modernization of the economy but not sufficient. The new businesses also must be of ‘good quality’. But what does that mean? One of the characteristics of this ‘good quality’ is the degree of innovation. Now the question arises: is it possible to measure the innovation? From the first 10 states using the GDP for each inhabitant, only one has a social contribution in the net profit resembling ours, Suede, with 38%. Next we find Finland with 29,6%. But the first 5 states as a developed well being

of the population has reduced ponders: Norway (16,3%), Island (13,7%), Switzerland (11,5%), USA (10,1%) and Denmark (2,2%). The data confirms a much tied connection between the work tax and the suburb economy, comparing that between the income tax and gray economy. The Northern states with large amount of social expenses in the brut profit have also increased suburb economies. Suede, Norway and Finland, have gray economies of 19%, while USA or Switzerland – only 8,8% of the total economy. In spite of reducing the income tax and those on the profit to 16%, Romania with assistance expenses of 38,6% has a suburb economy of 34,4%. It is very logical why a company manager to be very reticent to legalize his affair, as long as due to the “fiscal reform” it has a reduction for taxes, incomes and contributions by 2,2% of the brut profit, and not 9% as the governors say.

In Romania was created a vicious circle where the state is ensuring the minimum financial resources for stimulation of knowledge-based economy and only a few companies proved able to compete through innovation. Very often knowledge is strongly connected with people and all or part of it can do a major challenge. Innovation system is important for clarifying the area of innovation policy and also for fostering the interactions. According to the statistics of Ministry of Education and Research until 2002, a number of 590 units were involved in the innovation system. Out of which 280 were research and development institutes and 310 joint-stock companies (public or private) with research -development as the main object of activity. Since 2003 the situation of research system was improve because, on the hand, Romania became a member of the European Patent Convention in March and, on the other hand, the Government took the Decision 406/2003 where there are present specific conditions regarding the eligibility of a firm or a department of research institution to be considered as an innovation entity. In the document is specifically that the applicants for such a status provide certain documentation in order to be accepted. So, being with that decision an innovation entity can be called innovation infrastructure unit, practical a new concept was introduced refers to technological transfer centers which are financed through a governmental program. That initiative is very important for creating the visibility of the entity which wants to invest in innovation. The current situation of Romania is highly dependent upon the visibility level and the research system that includes the research institutes, the research departments of universities, and research departments of the companies.

The specific situation in Romania regarding the research system was considered to be the only policy element, so, research and innovation are not approached as different process that address distinct markets and have a different timelines. This does not mean that the research units are able to move on the global technological frontier and increase their chances to apply innovation. The initiative to the governmental level of innovative process based on the market strategies have the most important role in transforming the visible knowledge into marketable products and representing the economic opportunity of recombining knowledge. At top of that, more and more companies have involving in different stage of the innovation process. In order to stimulate the companies to start their learning process, the first necessary step is to ensure a higher visibility of the economic benefits that knowledge incorporation brings about. The policies instruments have to take account of changes in the innovation process quote the following recent developments:

- Romanian SMEs not only create added value by creating a technologically better product or service (technology push) but they do so increasingly by meeting a want or solving a problem (market pull). Due to new technologies such as ICT, businesses maintain a better contact with their customers and have better knowledge of their wants. The product increasingly becomes designed for the individual customer.

- Romanian SMEs which offer technologically advanced products master the whole trajectory of the production, from product development to marketing. Some parts of the production process may be outsourced but the business masters the intellectual property. Innovation increasingly is a matter of integration.

- Businesses innovate within the framework of open networks. Innovation needs knowledge coming from diverse sources and disciplines. In this direction in Romania the capital and financial channels for innovation activities can be the private venture capital. The availability of that capital does not depend only on financial issues, but also on other factors as follows:

- the risk propensity;
- the provider's capacity for technical evaluation;
- the provider's insertion on the innovation market.

The innovation infrastructure includes: incubators (infrastructure for start-ups), technological parks (experimental facilities), technical transfer centres and the system of intellectual property. Regarding the infrastructure the government consistent policy measures according to the recently launched National Plan for Developing the Infrastructure for Innovation and Technological Transfer. In this plan is mentioning the amount which is destined to co-finance centres of technological transfer, office for connection with industry, technological parks and technological incubators.

Ministry of Education and Research and the Ministry of Communications and Information Technology aim to attract to industrial parks with intention to create such parks in every Romanian city that has a university centre. They estimate that around 50 business incubators have been created, but there are no monitoring mechanisms and no efficiency criteria or targets for them. The whole set of documents released by the Romanian authorities regarding the evolution of research, development and innovation systems does not even address the issue of patents and it was only in 2004 that the grants are made conditional on patent applications.

RESULTS AND DISCUSSION

At the moment, companies hiring less than 10 employees produce more than 20% of Europe's value added and offers employment for approximately 50 million European Union' citizens. SME represent 98% of approximately all enterprises in Europe. Approximately 80% of their activities are carried out at a local or regional level. Therefore, for Romania the small and medium businesses are representing the engine of the economic growth and a vector for disseminating the research and development results. The increase of the small and medium businesses sector had a positive influence upon the businesses environment reducing the unemployment rate and increasing the productivity. It is necessary for the Romanian state to rethink the fiscal system in order to better sustain the growth of the small and medium businesses sector taking into consideration that even though its major role in the development of the country is known and admitted the support is not likewise. We think of this considering that even though the number of the small and medium businesses in Romania has grown, the number of small and medium businesses to 1000 inhabitants is under the number from the European Union (in Romania the number of small and medium businesses to 1000 inhabitants is 25 and in the European Union is 64).

To form an overview on SMEs in Romania, knowledge of nature in their innovation activities carried out are a starting point in analyzing the competitive advantage. Statistical data (Figure 1) for 2008 showed that innovation efforts of SMEs have focused mainly on new products (37,49%), new technology (28,75%), management and new marketing approaches (24,02%). These figures illustrate how Romanian entrepreneurs are becoming more aware that, in the context of growing competition in all areas of activity, innovation is the most effective way to ensure competitiveness.

Figure 1: Nature of innovative SMEs

Strategies related to the environment characteristics, when an accentuate competition on the internal market and a rapid change rhythm in their activity domain can be associated with the orientation to the international market- between them it should be mentioned the niche's strategy, which presupposes their concentration on the products and services for which it is disposed competitive advantages as a result of their capacity of innovation, adaptability and personalization of the production in connection with the request exigencies.

CONCLUSION

Innovation is a broad concept. Innovation is not in contradiction with tradition. Any type of entrepreneur, even when working in traditional sectors or in businesses with strong traditions such as family businesses can be innovative with the product, the production process or any aspect of doing business. Innovation is increasingly market pulled: entrepreneurs meet and want to solve a problem but at the same time the entrepreneur wants to influence his market structure or to develop new markets through his innovation. Policy has to protect intellectual property and to promote competition.

There is a high correlation but not full coincidence between entrepreneurship and innovation. To start a new business the entrepreneur must have conceived a business idea, the business model that will mould the goals, activities, and products or services of the new company. It must be based on the identification of an opportunity, which exploitation should produce product and services that satisfy a latent or manifest need in the market. The degree of innovation is monitored by policy makers. A high degree of innovation is considered to make the economy more 'competitive'. Innovation will not only support the development of new products or increase the productivity of labor and capital, but also bring more economic growth, employment, a better balance of payments, improve the labor conditions etc.

There is clearly a link between microeconomic issues such as entrepreneurial start-ups and macroeconomic performance. It is not easy to measure innovation. Businesses operate in international markets while policy makers focus on a territory. Very often the effect of a policy is felt beyond the territory of the government. In a large area such as the European Economic area there is much interdependence. This is especially the case in a small open economy operating in this type of market as is illustrated by the case of Romanian. So, the knowledge is fundamental for the creation of the wealth since with an appropriate one administration takes place a series of benefits. Is importance to improve innovation potential, quality and excellence operational? In conclusion, the major challenge is to extend the area of innovation especially in the software industry where Romania has an advantage. But this is

only the first step in this process for all parts involved. So, the state institutions have an important role in order to expand the visibility rules.

In some moments, it is necessary for the state to intervene to offset the adverse consequences of market registered small businesses. A condition for the success of Romanian SMEs is that those who decide its fate to look into the future, not past.

MANAGING THE ECONOMIC CRIMINALITY PHENOMENON - CURRENT CHALLENGES AND PERSPECTIVES

Ionica Oncioiu, TOMIS University of Constanta
Dan Balamaci, The Free International University from Moldova

ABSTRACT

The purpose of crime in business, the diversity of forms of manifestation of its area of coverage of large areas of economic, social and political as well as increased costs caused by organised crime, led to adoption in all Member of strategies to fight crime economy more or less effective. Preventing and combating crime is an ongoing social process, involving a mix of social, legal and criminal taken under the law of the state in close collaboration with various associations, to prevent and eliminate any risk of committing certain crimes. Currently, the extent and impact of particular crime phenomenon, which in many countries, threatening national sovereignty and state authority, democratic values and institutions, economy and national processes of democratization, have caused concern and interest of many international fora and organizations in developing documentation, studies, recommendations, conventions and other legal instruments to combat organised crime. In this paper I would like to present the economic criminality phenomen from the transnational point of view, as well as the juridical doctrinaire considerations upon the factual frame regarding the fight against it.

INTRODUCTION

The international community has been facing a savings "underground" large, characterized by "infiltration" of financial markets by organised crime structures in their attempt to take control of important economic sectors of national and international. Studies have revealed that the "washing" money from illegal operations is only one aspect of a broad-based global financial transactions, continues to rise. International financial markets include daily transactions worth over 175 billion dollars of which only a small proportion appear to be illicit operations. The rest is based on speculative capital, invested in the short term and that usually ensures anonymity to investors. The complexity and magnitude of this phenomenon is likely to discourage any attempt to control state and create conditions camuflare money from illegal operations. In the paper "Guide to International Monetary Laundering Law and Practice" laundering of capital is defined as "the process by which the criminal offense is hidden and transformed through the attempts to insert them in the financial system in order to give them the appearance of legal capital". After some recent studies of the International Monetary Fund (FMI), each year, the net benefits derived from criminal activities is over 1,200 billion U.S. dollars.

Index laundering of capital to large scale throughout the industrialized countries allows us to see that this phenomenon is directly proportional to all criminal activity in these countries. Finally, globalization of financial markets as a whole led to a volume of legal movement of capital such that funds can move freely washed into the general flow. Becomes practically impossible to distinguish the legal capital that are not legal. Most of the washing systems of capital transfers is based on complex financial crime concerning the transfer of foreign banks, often through financial paradise. In the current economical situation, a question that is raised is: why this phenomen is mentioned progressively in our attention? and why makes the object of the present study, being imposed a common working method for all countries?

Impact Of Economic And Financial Crime At The International Level

Most countries have realised that the fight against organised crime and international national can not be achieved only by improving the system of criminal law, through harmonization of legislation and cooperation with its recommendations and activities undertaken by international organizations involved in the criminal law. Currently, many countries on all continents harmonize its legislation and adopt measures to fight crime in light of the new issue of criminal phenomenon and recommendations of the UN. Preventing and combating crime is achieved through the identification, neutralization and removal of socio-human sources, which are likely to cause, to facilitate or encourage the perpetration of antisocial acts and finding the time and in full of the facts constituting the offense, so that any person who has committed an offense, be punished according to criminal culpability, and its no innocent person should not be held criminally liable. At present, the business criminality tends to become an antisocial phenomenon, materialized at a level of organization and specialization that expresses itself as a formal and informational network of organizations and individuals who, through the most diverse and sophisticated means and methods, manage to corrupt decision factors situated at highest levels in the areas of politics, legislation, justice and administration.

No matter if we deal with illegal transfer of patrimony towards businessmen, with theft, fraud or embezzlement to the detriment of the public property, or if they have to do with illegal capital export or contraband trade, the unlawful actions are committed in new forms and ways which are more or less sophisticated, but which really illustrate the term of “organization of the economic- financial criminality”.

During its entire evolution, the underground economy has speculated each opportunity generated by unsynchronized situations and lack of determination and has had as purpose the infiltration in any space left vacant by the official economy. In this way, in a relatively short period of time, the economy has evolved from completely uncovered forms of expression to a concealed activity. The transition was made from the traffic with goods of the size of a luggage rack to the contraband trade with vans of oil products, alcohol, and timber. In the process of building the underground structures, and later on, in the phase of growth and consolidation of the networks through tacit delimitation of action zones, the involved groups of interest had few moments of real competition or of major conflicts of interests, all of them against the background of the real professionalizing process of their criminal activity.

The involvement in the big businesses, the transactions with important sums and the connection to the international circuits of organized crime have meant the fulfilment of some conditions, namely: involving professionals, concentrating the traded values, eliminating competition through specific means and consequently focalizing decision. The relevant forecasts of the experts in this field reveal that the situation will considerably worsen in the not so distant future, unless measures will be taken against “the main enemy of the world’s stability”, the organized crime, which will come to influence and to dominate the social, economic and political life. It will achieve this influence through the control exerted by some organizations over some leaders, through the increasing control gained over mass-media that later on is transformed into a very efficient instrument for the protection of group interests or for attacks against the inconvenient ones. Thanks to that, the organized crime represents a major threat for all the fundamental elements of democracy, because it can even create an alternative political class, endangering the social stability and the harmonious development of that country where it is present. Although the activities are initiated to prevent and combat crime, it develops independently of the actions taken by public bodies for it. But what are the causes that determine factors such helplessness in the face of crime entitled? In current conditions, according to studies by the UN are the following causes:

1. criminal policy is not a priority for the political sphere.
2. lack of collaboration between all factors in the power to prevent and combat crime

3. failure due to the importance of the prevention of contact and community in this direction.

Thus, prevention is a lost battle before against root causes of delinquency. Towards a preventer effective, it is necessary that each member of the community and to understand the role that it plays in ensuring the safety civic climate.

Unfortunately, it is very difficult to change people, especially when they do not want this. Except a few strategies still experimental stage, there is a correctional easily generalized to macro-social level, to make it to interrupt the course of recurrent predictable. Predisposition to economical crime is remarkably resistant to attempts to change, especially in a state of law which prohibits the radical on people. This does not mean that offenders not recover, but yet not known what should be done to accelerate the 'natural' for reintegration into society. In addition, criminal measures are not designed as a means of more or less effective for rehabilitation or deterrence, but as a management and supervision of various types of risks. To end the deadlock that lead to repressive traditional solutions, today must be oriented towards the prevention, having as a basis of reasoning apparently emperor, that to sink economic crime, have attacked its causes. So, prevention is action on the "root causes" of economic crime.

The question to ask now is: why most projects that claim to deal with the real causes of crime does not produce the hoped? Firstly, they do not have the phenomenon of crime dynamics, diversity and new modes of operation used, and ignorance of true causes generators. Thus, poverty and unemployment are considered to cause more economic crime, watching that in periods of economic growth thefts are on the line upward. In developing prevention programs are passed unnoticed immediate causes of economic crime. Decisions of the economic offenders are strongly influenced by the circumstances of the moment, they are adapted to the circumstances that responds to fiscal "incitement and challenges". Preventing this type of crime by the action of the so-called deep cases is doomed to failure because it has a decidedly coverage, and total part of the dynamics of economic crime, claiming that changes may take place with the available resources and that may affect the freedoms person.

Criminals today watch constantly and not miss opportunities to exploit vulnerabilities in systems to protect against economic crime. It must find new ways to counter criminal tactics without minimize, under any circumstances, the ability of adapting offenders. To prevent a crime is sufficient to rupi a link of this chain, causal. Ideal is to target the link of the chain which is easily broken. Border between prevention and repression is often insignificant. But what effect has that prevent or punish prevents reprimând? That reprimând prevent a general influence. That repress preventing prevention is a state that has an important influence on activity. No strategic approach privileges neither prevention nor repression, suggesting she take more initiatives, preventive and repressive measures, instead of passive waiting, because criminals are constantly in action . The term crime prevention is often interpreted too narrow, and this leads to the view that economic crime is returning only the governments responsibility. On the other hand, the safety of the community allow broader interpretation and may encourage the participation of broad segments of society in the fight against economic crime.

CONCLUSIONS

Analysts forecast a significant increase in crime in the financial-banking and capital markets. This wave of fraud has turned the U.S. and has spread rapidly throughout the European Union. The financial crook claim runs banking business, are investors, banks shows that institutions that grant low interest savings on calls made and guarantees loans to large and tries to involve banks in their suspect in order to identify customers before. Pioneering work in this difficult area of financial crime, international banking, require the creation of bodies and intercommunication interoperativitate level of structures and services at international level, to the knowledge to prevent and counteract these phenomena.

Statistical speaking, at the moment, manz economical criminal cases having a transnational character, actualz go to trial. For manz countries, it is important not just a formal cooperation, but more that, a substantial cooperation in purpose to implement an efficient strategy including new rules of economic criminal law and economic criminal procedure law in order to stop the econoimic criminality phenomenon. he efforts of the European Union in fighting economic criminality have been directed to five areas, corresponding to those crimes severely impacting on the European economic and social environment. Only alternative is a modern state, as the aspiration of civil society, to counter effectively the scourge of global crime and the financing thereof.

THE PLACE OF THE SMEs IN THE INTERNATIONAL COMPETITION: EMPIRICAL EVIDENCE FOR ROMANIAN SMEs

Ionica Oncioiu, TOMIS University of Constanta

ABSTRACT

One of the issues covered by the current debate concerns the future of the national economy in a world in an accelerated process of globalization. It is, in fact, the transition from national economy to the global economy as homogenous global space in which national economies are melting and whose background includes a variety of positions since the companies compete globally and not states, and structuring is determined by the dynamic global economy industries and firms efforts to create competitive advantages. This paper has as main objective to understand and to approach the topic of the SMEs in the international competition, which, being considered a significant resource for those organizations is fundamental for the creation of the wealth since an appropriate administration takes place a series of benefits. Is it important to improve innovation potential, quality and operational excellence?

INTRODUCTION

Michael Porter argues, in turn, in his “Competitive advantage of nations”, the effort to assess the competitiveness of a nation must consider the standard of living result, because we can not talk about a competitive nation without that country's population has a level high standard of living. Definition, for example, strictly as part of market competitiveness, worldwide, which covers a country's exports bring limited and unproductive approach, because it takes into account the economy's ability to create the nation's welfare. Increasingly, we are witnessing changes in the business world does not resemble the past. This is why practitioners advocate for small and medium reinvention from that recognized principles have no relevance today. Competitiveness crisis facing the sector has not transient. Adam Smith's world and how it did business are a paradigm of yesterday. It turned out that a gradual transformation is illusory moment when radical transformation can not be postponed.

Recent theories and show new aspects related to the internationalization of business and, especially, the internationalization of SMEs, which raises a growing interest in academia and business in Europe and worldwide, while the transformations taking place in the economy beginning XXI century tend to bring small and medium enterprises at the forefront of economic development, giving them a new status.

As regards SME internationalization motivations, the literature associated to the two established categories of motivations for reactive and proactive type: The first category of motives which are reactive response to the pressures coming company in the business, such as: competitive pressure, lower domestic sales, excess capacity in relation to market opportunities at home, over-determined by off factors, the availability of foreign markets, etc.;The second category of motivations underlying voluntary commitment to international business in order to capitalize on competitive advantages, among them including: access to material and financial resources abroad, reducing costs by harnessing the benefits of economic or trade policy or foreign countries increasing the production scale, technological advance capitalizing held in some areas, management of external market orientation, etc.In our opinion internationalization and innovation besides Romanian SMEs lack the periodic review evaluation of their position in the market, according to the results of these tests, setting medium and long term strategies.

This refers to how powerful the SME market position, if this position is expected to improve or contrary to deteriorate, which is the position stands firm against rivals from the market (usually the local market) and each important competitive variable, which is the company's capacity to defend its position opposite the probable changes in the field of trade and competition anticipated movements.

The Romanian Smes In The International Competition: Stakes, Advantages And Limits

Increasing competition is the reality of sharp pressure on small and medium enterprises worldwide. To compete in niche markets for these companies bring unique balance resources, values and managerial capacities. The distinctive competencies they strive to build a competitive advantage relative to competitors and achieve superior financial performance, to ensure their access to some of the resources available to society. Capacity of larger firms to reduce costs through economies of scale effect, to support expensive research programs, SMEs oppose them greater flexibility and adaptation to market changes occur, greater mobility in the satisfaction of personal needs.

Innovation can be defined as new or innovative solutions in international competition. It provides small competitive advantage in that it provides, for a period of time, a monopoly to exploit unique trait obtained as a result of innovation. Furthermore, systematic innovation is probably the only indispensable lever for sustainable competitive advantage for small and medium enterprises.

To form an overview on SMEs in Romania, knowledge of nature in their innovation activities carried out are a starting point in analyzing the competitive advantage. Statistical data (Figure 1) for 2008 showed that innovation efforts of SMEs have focused mainly on new products (37,49%), new technology (28,75%), management and new marketing approaches (24,02%). These figures illustrate how Romanian entrepreneurs are becoming more aware that, in the context of growing competition in all areas of activity, innovation is the most effective way to ensure competitiveness.

Figure 1: Nature of innovative SMEs

Given the size of firms on innovative efforts is found that the extent to which companies aimed at improving staff training system and amplification increase with size businesses. Activities to introduce new products and improved uptake of technologies are more common in small organizations and small for micro-enterprises. Medium enterprises recorded in greater managerial and marketing approaches us.

Considering these aspects, it can be concluded that the processes of renewal of products and services are relatively common in most SMEs in Romania. Analysis by the results obtained in 2009 compared to 2008 reveals that companies with superior performance in innovation level is higher than the rest of economic units, which means that the business potential is influenced by the call to new technology and concerns to the managers compliance with the acquisition communitarian.

If small and medium enterprises in Romania, however, the emphasis is on motivation proactive type, and in particular on management involvement. I also raised a number of essential changes in typology and structure of small and medium enterprise sector, which have a more pronounced international dimension - its leading companies in sectors of the economy, virtual enterprises; integrated enterprises value added chain of large enterprises, business networks or clusters that raises a growing interest in literature.

Internationalization of SMEs is achieved, in principle, gradually, by going through several stages, which define as many types of companies with international activity and expressed specific motivations to participate in the global market. Studies from the 90s of last century shows that some firms, namely SMEs, there is a gradual process, the stage of internationalization, they have international activities since its establishment right to enter the market under the large geographical distance, to penetrate in several countries simultaneously, to form strategic alliances and joint ventures without the benefit of previous experience, etc. Therefore developed a new theory to explain the current process of internationalization, which is based on these developments and is centered on small and medium enterprises, which is currently in the process of consolidation. It is also generally agreed that none of these models alone can explain the dynamics of internationalization of SMEs, especially those leading sectors of the economy, whose main resource tends to be more represented by knowledge. It is often suggested a comprehensive approach that takes into account several models and theories to allow deepening phenomenon. However, most studies devoted to prioritize one of the models and the approach is still dominant stage.

At the same time essentially notes and changes in typology and structure of small and medium enterprise sector, due to these new developments. If the European Union special attention was given to the following types of SMEs: SMEs in the sectors of top technology and media have affinity with nature developed Internet business and new market developments, small and medium exploit the opportunities offered by electronic commerce, especially in services - sometimes called cyber-companies, small and medium-sized integrated value-added chains of large companies are forced to innovate under pressure from major customers. An analysis by the European Commission to member countries in May 2009 showed that 33,3% of medium firms and 32,2% of small generating over 10% of their turnover from new or renewed during the last two years. These weights are close to that of large enterprises (35,8%), which prove that European SMEs are becoming increasingly innovative.

In the U.S., SMEs account for 86% of all exporting firms. In the last 10 years, the number of small and medium exporters tripled, contributing 31% of total exports. Studies by the OECD show that the share of innovative SMEs in the total national companies varies between 30% and 60%, depending on the member country. On average, they perform research and development at a rate and a lower level of large companies, but prove more innovative redesign of products or services to better meet market demand, the introduction of new organizational forms that increase productivity or in inventing new techniques to expand the market. Worldwide, can be identified a small segment with an exceptional growth rate, which is positioned within the first 5-10% of companies in the world expanding. In many countries, the volume of jobs created by these SMEs is higher than that achieved large size firms. They are based on new technologies and developing impressive research activities.

These SMEs are found in industries knowledge-based high-tech and in regions where there is an intense economic activity. They play a pioneering role in developing new products and markets, bringing an outstanding contribution to the creation of a new type of global economy, one based on quality, professionalism and creativity of the workforce. So, in their haste to gain new markets or being forced to constantly reduce costs and increase quality, large corporations left uncovered important market niches that can be filled more effectively by small and medium enterprises. Therefore, intelligent strategies allow small businesses to grow despite increasing competition worldwide and marked the growing strength of large companies. SMEs can achieve this either independently, by promoting products / services

differentiated from those of large companies, either by working with large companies as subcontractors, or by building alliances to multiply their potential.

On the other hand, local or international alliances with big companies, strong SMEs can attract financial capital or material resources, distribution channels and internationally recognized brand names, which would not otherwise have access or would be had to make costly investments. In these alliances, small firms gain market niches, assimilates new technology or new equipment purchases performance. Access to capital is also an important benefit of this collaboration, many SMEs managed lately to obtain significant funding from sales to large firms of property rights for inventions that were made, but not had its own resources necessary to implement them.

Alliances of SMEs but is not limited only to those with big companies, they carried with companies of similar size. The sharing of infrastructure, technology and supply and distribution channels, allied SMEs manage productivity, competitiveness and ultimately profitability. But, it is necessary to be taken into account that innovation is a prerequisite for survival in the market for both companies in countries with advanced economies and for those in process development, it can change quickly today rankings that seemed unshakable. Dynamics dizzying technical progress in the current era is that companies and economies that until recently have excelled in certain areas they could lose global primacy over night the rate of introduction of innovation falls. Relevant aspects of the table are evaluated in terms of implications for business strategies, supplemented or restricted and used under the terms of each company. This type of analysis allows the positioning of the SME in relation to the competition, highlighting both their strengths and those of rivals.

Table no. 1: Competitive position of SMEs

Pluses(+):	Minuses(-):
<ul style="list-style-type: none"> - Competitive advantages; - High customer loyalty; - Well defined market strategy; - Well differentiated product offer; - Increasing market share; - High flexibility to changes in demand; - Other. 	<ul style="list-style-type: none"> - Poor competitive advantage; - Target of rival attacks; - Inadequate distribution system; - Poor response to changes in demand; - Bad reputation among customers; - Other.

Once the mission enterprise, assess business potential and positioned against the competition, the next step is to transpose the general objectives of the mission, to measure company performance. These general objectives that are established for longer periods of time vary depending on the specific terms of reference, usually focuses on SMEs: profits, turnover, market share, etc.

A rigorous system for measuring their achievement, supposedly basic parts: expressing indicator (turnover, profit, market share, etc.) unit (lei, %, units, etc.) and the (actual size). The general objectives of the Romanian SMEs can be ranked in relation to their scope of reference and hierarchical level to which they are established, the following sequence:

- Strategic overall objectives set out in the entrepreneurial SME, explicitly (usually in medium-sized companies) and implicitly (in the micro and small class), in relation to key areas of activity, they constitute the starting point objective in establishing the network of the company;
- Tactical objectives (derived) regarding the allocation of resources, they also usually set by the developer in micro and small and mid-level managers respectively of medium-sized companies;
- Operational objectives (operational) that set the business in micro-firms respectively lower level managers in medium-sized companies, they relate to specific activities, current, which serve to achieve

strategic and tactical objectives.

However, the objectives are the starting point in formulating strategies, providing the criteria against which, will be evaluating and measuring the results. These companies would be beneficial to gravitate as far as possible, around strategies difficult to imitate and / or offset, while starting from the premise that whenever one or more of the competing SMEs initiated by one nine “offensive” strategy, competitive pressures will be activated in November. Basically, the behavior of each “actor” in the market, that market influences, and this in turn affects their behavior. An important role in this regard plays various rivalries between SMEs, which appear in different market sectors. Extrapolating observations made by A. Thomson and A. Strickland on Romanian SMEs can formulate the following conclusions:

- Rivalries between SMEs tend to increase as the number of competitors increases and firms are close in size and potential;
- Rivalries are usually stronger when the growth rate of demand for our products is slow;
- Rivalries become more volatile and unpredictable, the more diversity of SMEs according to priorities and resources, etc., is higher.

Design strategies will match the specific conditions under which each company operates. In this sense, scientists have developed various classification schemes; to better define the types of strategies. Experience has shown that the wide range of strategic options can be grouped according to the general objectives set out in a few basic types known: growth strategies, maintenance strategies, defensive strategies and combined strategies, most of themselves and making their own choices achievement.

Basically Romanian SMEs are very poor offensive strategies involving:

- Anticipating issues that may create a competitive advantage;
- Planning of movements designed to surprise the opponents and give them less time to launch similar initiatives.

In preparing their strategies, SMEs can take account of a famous series of principles, which although does not guarantee success, increases the likelihood of:

1. Principle of critical masses - the concentration of actions in times and places critical to achieve a decisive effect;
2. Offensive principle - that exploiting the weaknesses of “enemy” to maintain control of the situation;
3. Principle of surprise - that such a choice of when and where action to capture the opponent unprepared.

In a highly competitive market as one that enables SMEs generally, each of which can become not only the subject, but also the object of attack rivals, be they companies or new entrants existing companies. Therefore, the purpose of defensive strategies is to minimize the risk of SMEs to be attacked, or decrease the intensity of the attack. Arsenal defensive strategies is vast, from those aimed at blocking access routes to competitors (which lends itself to a small extent but small and medium enterprises), to those designed to convince potential attacker, the effort is too high in relation to the effect (announcement intent to preserve market share, maintaining the profit share less attractive to outsiders, etc.). The benefits of successful defensive strategies are difficult to measure. Design strategies are a necessary condition but not sufficient to ensure survival and even growth of SMEs. It is therefore important that the developer be able to translate strategic vision into practice. It should be noted, however, that in a small and medium enterprises, implementation is facilitated by its structural and functional flexibility, the concentration of

power in the entrepreneur and the exercise by it of an active role authoritatively on his subordinates. The implementation of the various strategic options presented, concerns mainly the development of market strategies and financial strategy specific to each category of firms analyzed. Algorithm strategic management of SMEs can be developed on two vital directions listed: marketing and finance.

Attitude towards risk entrepreneur also has a considerable influence on strategy. Thus, those with reduced capacity to take risks will opt for so-called strategy mostly “safe”, which minimizes the impact of environmental threats; the profits are not spectacular, but acceptable. Often, the entrepreneur with risk aversion insists on addressing the financial perspective of the business, preferring financing from own resources of borrowed resources. He avoids as much as possible, significant financial commitments until the likely effects of the uncertainty is minimal. Moreover, innovations of any kind of business are interpreted as too risky, compared with the situation. Such places great value on entrepreneurial strategies “conservative” or defensive, designed to minimize risks.

A small entrepreneur with a high capacity to take risks, more proactive strategies “offensive”, with increased chances of profit, more demanding, challenging but also risky. For him, innovation is better imitation and offensive defense is better. The Romanian economy is already operating in an open and competitive. There are a number of measures that can help maintain the competitiveness of SMEs continue to operate on the domestic market more competitive and increasingly important, although often neglected in unrealistic. It would be beneficial for Romania's economic development undertakings in the sector to succeed domestically and at the same time, turn to international markets through appropriate strategic approach to find niches, avoiding direct competition with large companies on field market segment that it dominates.

CONCLUSIONS

We believe that a more general level, the shift from internationalization to globalization of economic life - one of the defining characteristics of the evolution of global business in the second half of the twentieth century - has a strong influence on SMEs and their internationalization. The influence is mixed, both negative, the top competition, increased business turbulence, but positive, facilitating access to new markets, supply and sales, accelerate the transfer of know-how, access to new technologies, partnerships and strategic alliances at international level, etc. Literature and actual developments of SMEs shows that it lies rather in a position to counter the negative effects of economic internationalization and to capitalize on the positive, especially in the peak areas of the economy.

In conclusions, the competitiveness of SMEs is therefore interdependent national business environment developments and political environment, business clusters, and development of industrial zones and internationalization of economic processes of globalization. Moreover, the internationalization of SMEs internationalization evolves with the national business environment. In the context of competitive markets XXI century, it becomes imperative need for strategic approaches to entrepreneurial survival and success of SMEs soliciting effective business strategies and actions. Strategic entrepreneurship is applicable to new SMEs and existing firms in the market, thereby facilitating the positive impact of the efforts of companies to identify the most advantageous opportunities with profit potential of the highest, according to available resources. According to Strategy 2020, Romania will harmonize legislation so as to enable promotion of the internationalization of SMEs and improve access to the single market. Entrepreneurship would need to be developed by concrete policy initiatives, including a simplification of company law (bankruptcy, the status of private companies, etc.) and initiatives to enable entrepreneurs to restart after bankruptcy. This gives in particular small means to participate fully in the Single Market.

After going through old and new concepts about the company and its competitiveness, conclusions can be drawn are very simple: from small and medium enterprises has been a competitive power market, whose springs are less predictable, but requires that any business that wants to survive to develop into a feature some form of uniqueness. Ultimately, the only sustainable competitive factor is innovation, which in turn depends on the quality of human resources and management. It is difficult to place small and medium

enterprises in domestic and foreign competition because they are less developed than in other transition countries. Their contribution to the growth performance of the Romanian economy is still needed.

The influence is mixed, both negative, by the superior concurrence, the increase of the turbulence of the businesses environment, and positive, facilitating the access at new markets of provision and sale, the acceleration of the know-how transfer, the access at new technologies, partnerships and strategic alliances at international level, etc. The full potential of the SME sector contributing to employment growth and competitiveness policy requires consistent and favorable development in general. In some moments, it is necessary for the state to intervene to offset the adverse consequences of market registered small businesses. A condition for the success of Romanian SMEs is that those who decide its fate to look into the future, not past.

THE MECHANICS OF HUMAN MIND IN THE ECONOMIC ENVIRONMENT

Catalin Neagu, The Academy of Economic Studies, Bucharest Romania

Silvia Iuscu, The Academy of Economic Studies, Bucharest Romania

Laura Neagu, HR SmartView Consulting, Bucharest Romania,

ABSTRACT

The crisis that started in 2008 in the Unites States is still producing huge losses to the world economy. Initially considered as a natural stage in the cyclic evolution of the economy, this crisis proved itself to be a real earthquake with disastrous effects, having a magnitude and a temporal breath without any precedent in the modern history of mankind. Rightly speaking, the status quo of today's economy has determined many people to point at the economists and place a big question mark upon the instruments' viability that they currently have at their disposal to anticipate, avoid, reduce or fight against the effects of such a crisis. Given the context, what becomes very clear is the need for a deep critical analysis of the fundamentals on which the entire theoretical construction of the economics sciences is built on and furthermore, the need for their adaptation to the current geo-political, economic and social context, globally. It's a must to reconsider the role that the human psychics-as trigger of the human economic behavior is playing - when economic processes are put on the move. This step can be taken through the transition from Adam Smith's "homo economicus" to the Keynesian "animal spirits".

KEYWORDS: crisis, behavior, irrational, "homo economicus", "animal spirits"

INTRODUCTION

The problems that appeared globally in the economic environment and the continuously growing difficulties that both economists and politicians face in the anticipation of the crisis emergency, out passing and counterbalancing the negative effects that this is producing, generates, - rightly speaking-question marks upon the correct fullness of the scientific fundamentals on which the entire construction of the global economic system, as we know it today, is based on.

One can notice that the implications of the crisis have long ago crossed over the borders of Economics and are already producing important changes in the world geo-political and economic configuration; no one takes hazardous chances of making definite statements on what the world would look like in one year time and even less, after the uncertain moment that announces the end of this crisis. For instance, the remarkable economic growth of China and the major problems of the United States of America, the difficult situation of the EURO currency as well as The European Union as a whole, the continuously growing ego of the states that own energetic resources, mentioning here, in the first instance, the Russian Federation, all these together, lead towards one certainty: the world after the crisis will look completely different than before it started; but what it will look like exactly, this is practically impossible to say right now.

If we take a look at the not very far away from us history, at the Big Crisis from 1930, the one that generated the unemployment phenomenon in the entire world and created a power vacuum that ultimately led to World War II resulting in over 50 million victims, we really have solid reasons to worry about. And to make the situation even more dramatic, we are facing now a context even more unfavorable than the one that generated the crisis in the '30s. To give just a few examples: the growing number of population

globally at the same time with the crisis of energy and food resources, globalization, pollution and world (wide) terrorism.

THE LIMITATIONS OF CONVENTIONAL ECONOMIC MODELS

Although number of signals showed the need for renewal between the Big Crisis and nowadays, the general pattern for economic development has stayed almost the same and starts to prove its limitations. Without minimizing the scientific, theoretical and practical value of the accumulations of the economics sciences up to now, we cannot leave unnoticed some omissions that generated, sometimes, improper answers to the challenges coming from the economic environment, especially in similar contexts with the one we are going through now. Even more than that, its scientific bases have been blessed more than 200 years ago, when the social, economic and political environment as well as the stage of technical-scientific development at global level, were completely different than the ones today.

The lack of reaction and the failure in quickly identifying solutions are caused by the fact that economists have learnt not to panic in case of economic recession or crisis phenomena. Economists know that the appearance of economic crisis based on the decline of certain markets, are part of normal cycle being even beneficial within the economy and overall progress as they lay the foundation for future economic expansion times. As a conclusion, according to the knowledge they have gathered, any disequilibrium which appears in the market will be counterbalanced by the action of the actors playing in the market, without any external intervention.

Adam Smith, mentioned in his book “Wealth of Nations” (1776), considered as fundamental to any economist, amongst other aspects, two essential ones:

1. markets have the capacity of self-regulation through the “invisible hand” that will always make a balance between demand and offer through the price;
2. people will always make rational decisions when they act as players in the economic environment (be them sellers, buyers or investors), because they are interested to satisfy as good as possible, own necessities and make profit, thus they will engage in any transaction that reaches mutual advantage.

Through his ideas, Adam Smith was one of the biggest supporters of classical liberalism the one that claimed the governmental non-intervention in the economic processes and his theories have been further on taken over and developed during the 1920-1930 by the representatives of School of Chicago and further on by their successors including, for instance, Milton Friedman. The two axioms stated by Adam Smith have dug deep down in the rationales of all generations of economists, many of these neglecting systematically any own deep analysis and placing them – consciously or unconsciously – at the basis of own conceptions about economics science. “Homo economicus” which Adam Smith created, perfectly rationale and well balanced in the decisions he makes in the market has become the key of economic theories which compose the basis of the world economic system as we know this today.

THE KEYNESIAN APPROACH OF ECONOMIC BEHAVIOR

Ever since the Big Crisis of the 30s the practical experience has proven that these theories are valid only under certain circumstances, and unfortunately, most of the specialists continue to ignore this reality even nowadays. From these realities on, the “perfectly rationale man” and “the perfectly free markets” are the two concepts which must be analyzed in the first instance when we are looking for the errors happening within the economic sciences throughout time. This doesn’t even constitute an avant-garde concern because, even with 1936, another huge economist, John Maynard Keynes, was considering exactly these aspects in his attempt of finding solutions out from the 30s Big Crisis. Keynes (1936, 1940) is introducing a couple of very interesting ideas.

In the first instance, he is describing an ingenuous procedure for diminishing unemployment which became endemic through the crisis. He says governments can borrow important amounts of money for investment in own economy to create work places. In other words, his approach is radically different to the classical one because he considers the intervention of state in the economy as a must while he contradicts at the same time some other very popular theories from that time. For instance, the monetary theory which stipulated that a natural rate of unemployment exists and in case state is trying to reduce unemployment under that rate, this will generate an increase in inflation or, the theory that said that the balance of the markets can only be troubled by the poor control of the state authorities over the quantity of money.

At the same time it was also himself to say that this intervention must not be a brutal one, but limited only to correct some of the unbalances caused by markets irrationalities or by some wrong perceptions of people. Keynes had a very plastic vision over the role state should have in economy, seeing similarities between this role and the one a parent has in the growth and education of the children (Levine, 2006). Government gets involved by defining limits and ensures that it does not develop much the basic instincts of people and markets and, at the same time, allowing independence to learn and be creative. Capitalist societies can be extraordinary creative but not necessarily in a good direction for the system and the government must take into account the following. Left on their own, these economies will chase excess out of the desire to make bigger and easy coming earnings; this will generate mania, then panic and ultimately unemployment; people will consume too much and will spare too little, minorities will be discriminated against, prices (houses, shares, oil etc.) will know big fluctuations generating instability and lack of confidence.

This recipe was not understood and appreciated enough during the Big Crisis, being only partially applied in the United States. It was systematically implemented only after World War II and practically led to the disappearance of unemployment until the '50s and afterwards ensuring a good control over the phenomenon. The macroeconomic Keynesian policies managed to keep, with small exceptions (Japan 1990, Indonesia after 1998 or Argentina 2001), the unemployment at acceptable and controllable levels until nowadays. Moreover, this measure could be equally effectively used in both market driven economies as well as in socialist markets. The remarkable results of these measures determined even the most fervent supporters of Adam Smith's "invisible hand" to recognize the merits of Keynes in the evolution of world economics after World War II. Happy with the solution found by Keynes regarding unemployment, people have not studied with the same carefulness another component from the findings of this great economist, one that was offering a more profound analysis of the way economy works and of the role government (authorities) play within the economy. Keynes (1936) is officially fighting, for the first time, the "homo economicus" concept of Adam Smith, saying that, in fact, people are not always rationale when they make decisions in the market, even more, are dominated by "animal spirits" when they action without any restrictions in the economic environment.

Keynes used to say that, although the main part of the economic activities has its origins in rational economic motivations, an important component of economic activity is set on motion by „animal spirits“. People have also non-economic motivations and cannot always be rationale when they chase their economic interests. On the other hand, the traditional economy is offering a perspective that derives from people's economic motivations and from rational, but it is ignoring the economic processes determined by the non-economic motivations or/and the irrational answers.

Anyway, according to the opinion of Akerlof and Schiller (2009), Keynesian theories that demonstrate the practical role of the state in remedying unbalances caused by the irrationalities of the markets or by the wrong perceptions of people, couldn't have become at that time very popular, given the historical and political context - and the economists - under the influence of libertarianism - were not prepared to accept such ideas. The Keynesian wording "animal spirits" has been seen as implying a negative meaning and

was avoided by many economists. In fact, at a closer look, the wording "animal spirits" doesn't necessarily imply such meaning, as one could believe when first hearing it, even if this is included.

Keeping silence over the emotional component of Keynes theory led to a shorter version of the General Theory, which, unfortunately, was largely accepted during 1950-1960. The slogan: "I believe in free economy" (without any intervention from the authorities) became a glorifying title for politicians and economists and influenced national policies all over the world. Thus, we meet in England the "Thatcherism", or in the US – the "Reaganism". The authorities' involvement in economic processes was only accepted on the one hand for investments made in order to control unemployment and, on the other hand, towards controlling the monetary mass. The role of authorities in making the regulations of the market in order to diminish the emotional activities in the economic environment was disapproved and denied by many generations of economists and even politicians. The transition from "homo economicus" as described by Adam Smith to "animal spirits" which Keynes spoke about for the first time, was not taking place yet (Akerlof and Shiller 2009). Even more, nowadays they cannot be embraced by those who understand labor and money market through the theories of Milton Friedman (1970), one of the well-known fighters against the Keynesian macroeconomic model. But Keynes has the big merit of being the first economist who included the emotions as well as the illusion among the factors that explain recessions/economic fluctuations which not always respect the macroeconomic models, even more these behave sometimes against the predictions.

THE BEHAVIORISTS' THINKING IN NOWADAYS ECONOMIC PROCESSES

The painful lesson we learnt during the Big Crisis was too soon forgotten. The minimal or inappropriate intervention of governments to support markets balance ended as of 2001 into series of bankruptcies which pointed out completely irrational and toxic behaviors that the players (individuals or groups) on different markets used to have, especially those from the financial markets. Specialized literature is full of such examples (Enron together with its accountant Arthur Andersen in 2001, Lehman-Brothers, Chrysler so on), and this made, for the first time, some of the strongest supporters of rational thinking in the economic processes admit that the thinking pattern that they used to promote for so many years, was a wrong one. For instance, Alan Greenspan, the ex-president of Federal Reserve declared himself "blocked" by the fact that markets did not self-regulate as the classical economic theory is stipulating ever since Adam Smith's (Ariely, 2009).

Unfortunately, the mechanism of nowadays economy has in the middle of its conception the notion of profit as the single thing that is putting the world in motion. The complexity of human being is systematically ignored and people are referred to as simple "resources" used for getting even more profit. The best example for this statement is given by the name of the personnel department in most organizations all over the world. It is named "Human Resources Department" and this represents a good proof regarding the mentality.

Our economic system is ignoring that, in fact, the identity of people is unique and set up on complex basis. The complexity of each individual could be introduced through the so-called "paradigm of the integral human being" (Covey, 2004). According to this, people are not things which need to be motivated and controlled, they have four dimensions: body, mind, heart and spirit. Actually, even if they are ignored by economists, these four dimensions can be identified throughout all the religion or philosophy progress of humanity along its history. These dimensions are revealing the four fundamental needs and motivations of every person: to live (survival - body), to love (relation - hart), to learn (raise and development - mind) and to leave behind a legacy (significance and contribution - spirit).

The economists are tempted to simplify the human motivations in the economic field by associating a "utility function" to each person (Akerlof and Kranton, 2010). The utility function represents a

mathematical expression which is describing in a formal way the things people care about and is giving us the possibility to classify the motivations. According to these, each person is taking decisions which are able to maximize his/her utility function. The problem is that most of the motivation theories are based on the pecuniary ones. But people have also non-pecuniary motivations as need of status, their wish to have children or need of equity.

Starting with 1957, Garry Becker tried to change this establishment, by developing different ways of representation for human real preferences taking into account discrimination, children's mind, altruism, addiction or punishment. He tried to explain the involvement of non-economic motivations like the above mentioned ones, over the markets, including the labor market. Becker was one of the first promoters of the enlargement of the field of Economics as a science, and his direction of research was approved by other economists who are trying to identify the non-economic motivation of people acting in the economic environment. These motivations also depend of the individual characteristics close connected to the social norms and social context. The main part of these motivations is based on the notion called *identity* (Akerlof and Kranton, 2010), that puts people in a social context. Taking into account the identity, individuals are seen as normal persons who act naturally, even instinctual, not necessary according to rational ways, in real situations and environments.

It is very clear now that the economic phenomena, as part of human being, are to be studied through the complexity of human being in order to be fully understood and well explained. In this way the economy as science can return to its primordial condition to be a social one, with and about people and not only about money and profit.

On the other hand, starting with 2008, it has become clearer than ever that the mistakes that people are doing in the economic field are not happening by chance but are part of the human being, representing an intrinsic characteristic. "The mistakes" that people make in economy, no matter the role they play within, put all together, generate effects which are impossible to anticipate by using the traditional methods of economy. The truth discovered by Keynes and forgotten or ignored by so many generations of economists, appears today clearer than ever: people, in their decisions and actions defy, for many times, rational thinking despite the fact that human mind is considered to be one of nature's works which is coming closest to perfection.

Keynes initial ideas about the human behavior, together with all the accumulations from him on, led to the development of a new trend in modern economy, named *behaviorism*. As long as things were moving in the direction of choice, no one could, and even if wanted, wouldn't manage to destroy the fundamental paradigms on which the entire economic construction was staying. The approach of the economic processes by taking into account the behaviorist ideas is enlarging very much the perspective over the degree to which the economic processes are known. The last crisis, but also others from the history have not been foreseen because there are no principles of conventional economic theories to consider animal spirits. Most of the economic theories treat "rational expectations" and "effective markets" and exclude changing thinking patterns, irrational types of behavior in business, loss of confidence and security, they exclude the feeling of right approach which diminishes the flexibility of salaries and prices, exclude the role of corruption and of selling low quality products during economic boost, the role of the stories through which we "interpret the economy".

The outburst of the crisis in 2008 meant a new breath for the ones who support such ideas. The behaviorist economy jumped from the status of niche domain to the emergent side of the economics sciences. Behaviorism has a strong connection with other sciences, especially with the ones that study human mind and actions from different perspectives, such as psychology, medicine or sociology, fact that means a much bigger cognitive effort.

Contemporary behaviorists are offering an even more complete image over the concept of “animal spirits”. They define it as a native optimism which makes the consumer spend and the entrepreneur invest, state of mind that leads to ignoring fear of failure, fear of bankruptcy or loss- which is similar to a healthy person ignoring death. Also, they have identified some different sides of the animal spirits (Akerlof and Shiller 2009, Ariely 2009) that affect the economic decisions of people. Many of the unanswered questions from the classical theories can find their answers by taking these aspects into account when we analyze the way economy works.

The main thing we have to take into account when we try to consider people in the economic science is the relativity which is acting always and everywhere in our lives. Taken into account even by the more precise sciences like physics or mathematics, relativity was systematically ignored by the economy, although it is playing an important role in the decision making process. It modifies the decision depending on the reporting basis (Ariely, 2009); we are assessing decisions depending on other aspects and we compare them with the available alternative where we stand. This is partially explaining why people tend to have wishes and expectations above own necessities and financial possibilities. There is a vicious circle, in which, the more they have, the more they want to have. The same relativity appears in establishing the price in the market, which, far from being established by demand/offer mechanics is being influenced to a great degree, by human subjectivity.

The relativity in economics is close connected with the perceptual processes of mind, which have a main role in the economic decision of people. McShane (2004) defines perception as the process of selecting, organizing, and interpreting information in order to make sense of the world around us. It is pretty complex and involves deciding which information to take into account, how to classify it, and how to interpret it within the framework of our existing knowledge. Perception is one of the main things which are building the identity because it is different from one person to another. It depends on the interactions between our senses and the environmental stimuli. Although this concept was largely treated in sociology, psychology or even philosophy, it was unvalued by the economists. The individual perception is also influenced by our expectations, according to which the human mind is “seeing” only what it expects to see and can influence almost all aspects of our lives. The consumer behavior can be easily influenced by the way in which the product is presented. In this way, similar products can know success to different degrees depending on the way in which they are wrapped up and offered in the selling process.

Dan Ariely (2009) considers that the expectations are offering valid explanations for many of the human activities: they make us understand one another even if around us it is noise and we cannot hear every word of the person who is talking, they help us understand a SMS written on the mobile, even if not all wording is correct, etc. An interesting phenomenon is the placebo effect that is also formed based on expectations through two mechanics: 1. Belief - the trust we have in the medicine or the procedure; 2. Conditionality – the body knows what to expect, based on repeated previous expectations. Moreover, Ariely (2009) observed that expectations are influenced by stereotypes, ways of classifying information, hoping to foresee an experience. The stereotype is generated by the fact that human brain cannot start all over again from 0, every time it is confronted with a new situation as it needs certain benchmarks which can only be found in similar past experiences. They are generally positive but can have negative effects as they influence negatively our perceptions and our behavior.

The same mechanism is working regarding the stories – they are in fact stories of events that took place in the past, and can be used as examples or actions to be avoided by people. The social psychologists Schank and Abelson (1977, 1995) concluded that stories and retelling them represent the fundament of human knowing. Also, they are telling that the human memories are staying in our brain around the stories. This is the reason why they are influencing the economic balances because human mind is programmed to

think following the patterns of past examples. Thus, stories affect the markets because stories are not only explaining the facts; they ARE the facts (Akerlof and Schiller, 2009).

On the other hand, the economic processes have to take into account the notion of trust/un-trust that we have ones towards the others. Behaviorists noticed that, in the opinion of the traditionalist economists, the meaning of trust is a prediction, the feeling of trust or untrusted projects an optimistic or dark future. But this is incomplete because people are unsure and inconsistent about making estimates of efficiency, productivity and, generally speaking, with the effects that their actions have in the medium and long run. In reality, trust is much more than a prediction; it is a “belief” or “total faith”. At the same time, it is an economic term that defines those elements of UNREST and INCONSISTENCY in economy; it refers to our peculiar relationship with ambiguity which can paralyze us or, on the contrary, can give us a new impulse, helping us out pass our fears and indecisiveness (Akerlof and Schiller 2009). Keynes (1937) also looked at this side of “animal spirits”, referring to a multiplier of trust = the change in income which results from a change with one unit in trust, no matter how this is quantified. Unfortunately, the only Keynesian multiplier that stayed in the minds of the economists was the multiplier of investments. This is very important especially in the description of decision making processes. As the classical theories say, the decision is the result of the weighted average of quantitative benefits, multiplied by the qualitative probabilities.

The notion of “equity” is also missing from the manuals of economy because, in the conception of traditionalists, these should address economic subjects and not such subjects who rather belong to the area of psychology, anthropology, philosophy, or any other side of knowing that teaches us equity. Equity is a factor from outside the formal spectrum of the economic subject, many times ignored, but which represents the fundamental cause of main economic phenomena. The motivation given by equity can out pass the rational economic motivation because people are concerned with equity. For instance, if potential investors feel corruption, antisocial behavior or bad faith on the financial markets, they may want to withdraw or stop making further investments. This can be a major factor which gives orientation to important flows of money. On the other hand, too much trust can generate disequilibria – having moved their focus from the financial markets leading to loss of control of their money. This happened, as an example, in Enron case of 2001 when the investors got too much trust in real estate markets as a consequence of losing trust in financial markets. We can notice that there is a closer connection between this and equity, the two sides being in an inverse ratio one against another: the high levels of equity mean that corruption, antisocial behavior or bad faith are situated at supportable levels in the people perception. On the other hand, according to the classical economic statements starting with Adam Smith (1776), people are considered to be honest and having the gift of not disturbing others, the hypothesis which is yet, an incomplete one.

Also, the traditional economy is ignoring that every individual is simultaneously living in two worlds: one in which social norms prevail (family, work place, the friends relationship) and another one in which the norms are made by the rules of the market (as buyer, seller, and worker). Social norms are vague, permissive and come from our need of living in the community as well as the need of communicating. In this case, the reward for an action is not really necessary because the support a person gives is motivated as a gesture by friendship as mutuality is not necessary at all means. The other world is much tougher and completely different from the first one: it is based on the rules of mutuality: you give me; I give you or more nicely said: the report cost – benefit. The symbols of change are very well defined: prices, salaries, interest rates, rents or trade-off. Everything is fine as long as the two worlds exist in parallel and do not cross into each other brutally. One must know how to face each of these worlds, otherwise he/she are considered misfit. Introducing the norms of the markets in the social relationship breaks the social norms and is badly affecting human relations (e.g. sex – for free, received in a social context, or against charge, according to the rules of the market – Akerloff and Shiller, 2009). The ideas with two worlds expressed by Dan Ariely (2009) have to be completed with the third world, an internal one, what is inside each of

us. In this world, the social or market rules or norms have a secondary role and give us the liberty to dream, to imagine things or facts or to have hidden wishes, even if they break the rules or norms. The internal world is the ground of the other two worlds.

Freud (1923) concluded that humans are hiding beneath three sides – a super-ego (ideal-ego), an ego and an “id”, a dark side capable of transforming him/her in a beast under certain circumstances. This malefic side can be associated with passion, an exaggerated passion above the limits of rational. Freud was explaining through this, part of most horrible actions undertaken by some of the human beings: crimes, rapes and in general any action that can be classified as irrational.

By studying this duality within some experiments of a sociology nature Ariely (2009) reaches a rather surprising conclusion that even the most sparking and rational person, in the turmoil of passion, seems to be completely separated from what he/she thought about himself. By generalizing, people not only make wrong predictions about themselves, but the error margin is a broad one. The excitement state, in which the brain is brought through various stimuli, makes people lose control and adopt a behavior which is totally different than what they were anticipating their reactions would be, when they were not under the respective stimuli. The following question appears: what is happening when the irrational ego prevails? It is clear that our self-control and self-censoring power is a limited one; and if we cannot anticipate our own reactions under certain circumstances, we definitely cannot anticipate the actions undertaken by others. It is practically impossible to judge the way in which we will behave when we lose our temper or lose our heads. The decisions made in such moments cannot be considered to be rational. In the economic environment we act with passion, we want to buy an expensive good (the newest gadget, the most recent model of an expensive car), forgetting about the practical assessment that we previously did to the good, analyzing its usefulness, also our financial possibilities, the risk of producing embarrassment to the people around us, our family etc. The answer to the same question will be different depending on the mood we are in: excited, normal or relaxed. This is a typical example of irrational decision which influences to a big degree the balances in the markets by artificially increasing the demand. If we talk about organizations, we notice that the same irrational, passionate behavior stays at the basis of decisions which are important to the life of the organization and its members.

Dan Hill (2007) stressed the necessity of making the separation between rational and emotional within the frame of the economic processes. He observed that the business people are feeling good with rational proceedings and tend to skip over the emotional aspects that are not necessarily logical. The main reason of ignoring emotions in the business world is given by the difficulty to quantify, anticipate or control them. The main issue that the economists are to face is given by the real difficulties regarding the transposal of the mechanisms of human thinking or feeling into mathematical models.

Although it is much more difficult to quantify, the irrational/non-economic component will have to be considered when establishing the future macroeconomic models. At the same time, studying the economic processes through behavior perspective, we can notice some variables that are constantly influencing the thinking of people and are able to radically modify the results and conclusions that classical models are leading us to. Starting from some very interesting experiments about the elements that people base their thinking on, Dan Ariely (2009) goes even further and states that people are not only simply irrational but even irrational in a predictable way because their irrationality is repeating in the same manner in different circumstances.

One first predictable behavior is the natural tendency of human being to get most with the minimum effort. This can be seen as an absolutely rational decision and it is called efficiency, or its mathematical opposite: proficiency. Ariely (2009) observed that people were happy when they received free promotional products, they accepted them gladly, either they were or not useful to them. Marketing as a branch of economics has well understood this natural tendency that people have and based on this, series

of strategies for boosting sales have been developed. Free products, pay for two and get three, promotional materials nicely presented, they have all been developed to maximize sales. Example: a person will buy two products even if they are not really useful to him/her, only for the desire to nourish own pleasure of getting the third product for free – this is influencing the demand. Changes in price are influencing the rationale of the buyers' decisions – this one has the availability to give away part of the usefulness of a product against the price. The price is clearly influencing the rationality of the decision.

Also, people have a systematic tendency to postpone putting in practice some important decisions: going to the doctor, giving up smoking, start practicing sport, students starting to learn long before the examination period, etc., these are only a couple of rational decisions that people make and they are perfectly conscious about, but they tend to postpone on undetermined periods of time or even forget them for good, once they have been clearly defined. Postponing is part of our way of being and this affects fundamentally the economic balances. For instance, postponing putting into practice the decision of saving money is a problem affecting the economy. Procrastination is part of our behavior and can be defined as the act of giving in, piece by piece, our strategic long term objectives in favor of some small but immediate satisfactions. Actually, this says that we all have problems with our self-control.

Moreover, people have a tendency to overestimate what they possess. Owning may refer to different objects, but also ideas that we consider to be much more valuable than they really are, and we present them to the others, without being able to give them up.

Additionally, people are endowed, most of the times, with an unjustified desire to have the possibility to choose among options. When one is actually confronted with such a situation, he either doesn't know how to choose (he doesn't establish well the criteria), or makes late choices, or gets blocked being incapable to make a final decision. As a conclusion, someone's desire to have alternatives is a predictably irrational one (Ariely, 2009).

Beside this, Ariely (2009) observed that people are not necessarily honest. When they are given the chance, many honest people will cheat. Yet, most people will not exaggerate with this procedure and will take into account the degree in which they disturb the people around them. Even more, cheating does not offer to the human mind the same satisfaction received through honest means. The satisfaction is nourished also by the appreciation received from the others, who, generally, will not tolerate cheating. Even the decision regarding the way of action: honest – dishonest is based on the analysis cost – benefit. Platoon used to say that honesty is a moral virtue in almost all societies.

Last but not least, the truth is that people have the illusion of money (Akerloff and Schiller, 2009). This reality was denied by the supporters of rational thinking in economy and this was actually the weak point of many economic theories like the theory of the natural rate of unemployment launched in 1967 by Milton Friedman. We can see the proof of such illusion day by day, for instance in the resistance against salaries being reduced, named also "the decreasing rigidity of salaries in money". The illusion of money is contradicting also another wrong hypothesis of modern macroeconomics which states that people "see" through the cover of inflation; in fact, people have no sense for inflation and we can notice this in the fact that many negotiated contracts are not being indexed with inflation (salaries, bonds, etc.).

CONCLUSIONS

The human mind does not have an infinite capacity to think but it is based on previous experiences, environment, social stereotypes, personal state of mind, emotions, myopia and all of these are producing major derailments from the rational. This perspective gives us the feeling that we are pawns in a game of forces which we cannot understand. We consider that we master the situations that we are confronting with, but, in fact, we are the prisoners of our own mind, which, influenced by various optical illusions, is showing us the rational in a different way than it is in reality. Although the irrational does exist almost

everywhere, this doesn't mean that we cannot control the economic phenomena or that we must give in as we will not be able to anticipate the future developments. Once we are aware of this status quo, we can initiate measures to come as close as possible to the limits of rational: self-control, methodical decision making and not based on the impulses of the moment, vigilance, usage of technology, etc.

This is why, no matter what macroeconomic model we consider, this is incomplete unless we take into account all the complexity of the human being. Thus, in order to fully understand the economy, we must understand how this is being influenced by "animal spirits".

EMOTIONAL INTELLIGENCE ESSENTIAL COMPONENT OF LEADERSHIP

ABSTRACT

Emotional intelligence has come to play an essential part in the way present day leaders react to daily challenges. Improvement of their emotional intelligence makes them excel in mastering the complex and difficult work of leadership. Emotional intelligence is important for both personal and as institutional development because its principles provide a new path toward understanding and assessing people's behaviours, skills, abilities, potential and management styles. Leaders feature some common traits such as clear vision, purpose, passion and integrity that boil down to self-awareness, candor and maturity as their components. Emotional intelligence has become a vital part of the way present day leaders face the significant challenges they have to face. Emotional intelligence is an important factor in planning human resources, staff recruitment, managerial development, customer relations and many others. Success requires much more than IQ (the coefficient of conventional intelligence), which tends to be taken as the traditional measurement of intelligence, overlooking essential kinds of behavior and characteristic elements. Emotional intelligence describes the capacity of perceiving, evaluating, understanding and managing one's own emotions as well as the emotions of other people; it means recognizing your emotions and acting upon them in a rational way.

INTRODUCTION

"My definition of a leader . . . is a man who can persuade people to do what they don't want to do, or do what they're too lazy to do, and like it." - Harry S. Truman, 1884-1972, Thirty-third President of the United States. A simple definition of leadership might be that it represents the art of motivating a group of people towards attaining a common goal. The leader is the person who combines a range of skills and personality likely to make the people around want to follow in his/her footsteps. John C. Maxwell (2007) stated in his book entitled *The 21 Irrefutable Laws of Leadership: Follow Them and People Will Follow You* that: "Leadership is influence – nothing more and nothing less". The originating source of leadership has become a moot point. Some consider that it might be accounted for by some inborn ability whereas others claim that leadership can be learnt by focusing on improving leadership skills.

Leader Versus Manager

Basically, a leader's role in an organization involves:

- ♦ developing clear vision
- ♦ imparting this vision to others so that it might be followed freely
- ♦ providing information, knowledge and methods for implementing this vision

- ♦ coordinating and managing the conflicts of interests of all parties involved

Unlike management, leadership springs from personality and it may be consolidated through training or counseling. Management is a career. Leadership is a calling. The greatest difference between managers and leaders lies in the ability of motivating their work staff into following them and that sets the ring for most of the other work related issues. Most people, actually, are both managers and leaders. They occupy management positions but realize that one cannot simply buy out people into making them follow in their wake, particularly along a tough road; hence they act as genuine leaders. By definition, managers have subordinates. Managers occupy a position of authority with the company's endorsement.

All leaders seem to share some common features. Firstly, it is their guiding vision or goal. A leader has a clear idea of what is to be done on the personal or professional level, and s/he will focus on the goal irrespective of obstacles. A second characteristic is passion or enthusiasm and the ability to impart passion to others. Thirdly, it is integrity with its three components: self – awareness, candor and maturity. Self-awareness means being aware of one's weak and strong points. Candor means being sincere with oneself, and it is the key to self-knowledge. Maturity is the result of lessons learnt through the observation of the people around and by working with them. Maturity is always genuine and it is never subservient. The latter two traits go hand in hand: curiosity and bravery. A leader wants to learn as much as possible and he is ready to take risks. Some of the leader - manager differences have been illustrated in the following table:

Table 1: The differences between leader and manager

Leader	Manager
Is original	Is a copy
Is in search of change	Is in search of stabilization
Has followers	Has subordinates
Sees the long term picture	Sees the short term picture
Is vision bound	Is objectives bound
Has charisma	Has authority
Is proactive	Is reactive
Sells	Talks
Fights	Acts
Develops	Maintains
Follows new directions	Follows existing paths
Gives credit	Takes credit
Takes blame upon himself	Blames
Has formal power	Has informal power
Innovates	Manages
Inspires confidence	Resorts to control
Asks questions about what and why	Asks questions about how and when

Forms of leadership are to be found in a wide range of human concerns such as business, organizations, politics, trade unions, sports and the army down to the children's playground where little leaders might emerge. They represent true role models in a range of situations for the people around. Initiative, persuasion, tenacity, capacity of action and decision are the common features of great leaders. 98% of the "top performers" have a high coefficient of emotional intelligence.

Emotional Intelligence And Leadership

The essential component of leadership, emotional intelligence is an attitude, a way of life. Emotional intelligence has become a vital part of the way present day leaders face the significant challenges they have to face. Emotional intelligence can help leaders to play their part, always a difficult one, a part that most people seem to find difficult to play. Andy Green (2009) claims that perceptions are based more

often than not on feelings rather than on facts. Leadership is an inner state; one cannot learn it from books. Acquiring a leadership role springs from one's heart and soul. If the leader transmits positive emotions, enthusiasm, energy, the organization will prosper whereas if the leader transmits negative emotions, then the whole company will suffer.

Emotional intelligence describes the capacity of perceiving, evaluating, understanding and managing one's own emotions as well as the emotions of other people; it means recognizing your emotions and acting upon them in a rational way. Andy Green states that emotional abilities allow us to adopt an upfront attitude towards our colleagues and people in general and impart our knowledge. We will ask for help when needed, discussing suggestions and opinions in order to promote a culture of informational exchange. By using our personal experience we will understand issues better. We will ask questions about the problems other people have and try to understand their motivations. Our emotional abilities allow us to grasp the verbal and nonverbal clues in any communication (Green, 2009).

Emotional intelligence has acquired an essential role in the way present day leaders cope with everyday challenges. Emotional intelligence improves a leader's capacity of excellent performance in carrying out increasingly more complex and difficult tasks. Emotional intelligence is becoming increasingly relevant both for personal development as well as institutional one, since the principles of emotional intelligence offer a new way of comprehending and evaluating the behavior of the people, their aptitudes, skills, and potential and management styles. The same Andy Green (2009) claims that when we communicate we use our emotional abilities in order to adapt communication to the needs of the audience and to speak convincingly. Emotional intelligence is an important factor in planning human resources, in staff recruitment, in managerial development, customer relations and many others. Andy Green states that our emotional skills allow us to have a holistic view upon any situation. They help us to go beyond obviously logical elements by taking into consideration the connections and similarities among seemingly unrelated objects which eventually allows us to discriminate between the essential and the accidental. The emotional coefficients help us with managing ambiguous situations and capitalize on possible opportunities in any situation (Green, 2009).

The emotional coefficient – in Green's opinion (2009) – helps us assume responsibility and acknowledge we might have been mistaken, or even be the first ones to admit our errors. It helps us face criticism and learn from it, see it as feedback not as accusation, a constructive kind of feedback which has eventually earned us a good lesson. The emotional coefficient gives us confidence in communicating a message. Emotional intelligence is becoming increasingly more relevant for both personal development as well as organizational development as the principles of emotional intelligence offer a new path of understanding and assessing people's behaviors, skills, abilities and their potential and management styles. Emotional intelligence is an important factor in planning human resources, staff recruitment, managerial development, customer relations and many others.

For a long period of time the emphasis has been on certain aspects of intelligence, such as logical reasoning, verbal, visual, spatial and mathematical skills. All of them can be measured by using the instrument named IQ. We can find in this way how fast one learns new things, how well one focuses on new tasks, how well we support our point of view. Researchers have been confused by the fact that while IQ was likely to predict academic performance, there were people featuring high IQs with poor life records, but also people featuring average IQ, with spectacular life records. Some of us do certain tasks with great ease while others cannot simply do them. That is how one came to conclude that the success equation lacked one item – emotional intelligence.

Success requires much more than IQ (the coefficient of conventional intelligence), which tends to be taken as the traditional measurement of intelligence, overlooking essential kinds of behavior and characteristic elements. The IQ, states Green, measures how fast we can learn new things, or focus on

tasks and exercises; how we remember and recall fact based information; how we deal with the process of argumentation; how we manipulate numbers; how we can think both analytically as well as in an abstract way as well as how we can solve problems based on applying previous knowledge” (Stein and Book, 2007). Each of us has come across at least one person who from an intellectual point of view is a genius though utterly incapable of expressing ideas, feelings or communicating with other people. A high IQ coefficient does not automatically spell success. The development of emotional intelligence helps us to capitalize on our intellectual attitudes and ensures success on the personal professional level.

It goes without saying that emotional intelligence- the capacity of giving our best – is an essential area in the repertoire of a leader. Our work with emotionally minded organizations can make a difference between an efficient result and a mediocre professional output. An executive leader’s intelligence or IQ- represents less than 25% of the success he/she might have in carrying out a range of activities in his/her company. A percentage ranging between 75% and 96% from a leader’s success is based on his/her emotional intelligence. If classical intelligence is the one that makes a manager reach senior leadership position, holding it and getting results come from emotional intelligence. That is the essential difference between artists and performers.

The areas of emotional intelligence and incumbent competences as seen by Goleman (2005) are :
Personal Competence reflects the way we deal with ourselves.

Self-awareness

Emotional self-awareness
Fair self-evaluation
Self-confidence

Self-control

Emotional self-control
Transparency
Adaptability

Ambition
Initiative
Optimism

Social Competence reflects the way we manage our relations.

Social awareness

Empathy
Organizational awareness
Kindness

Relationships management

Inspired leadership
Influence
Training others
Sparking off change
Conflict management
Team spirit and collaboration

The elements of emotional intelligence are:

- Awareness of personal emotions

- Emotion management
- Guiding emotions toward reaching a goal
- Empathy
- Adeptness at inducing positive interpersonal relations

CONCLUSIONS

In the United States of America social and emotional learning (SEL – Social and Emotional Learning) is part of the compulsory school curriculum. Children discuss about emotional and social education in schools from Singapore, Malaysia, Japan, Korea and Hong Kong. In the United Kingdom of Great Britain, Australia, New Zealand, as well as in Latin America and Africa there are schools that have accepted the concept of emotional intelligence. In Romania there are few companies that have become aware of the role of emotional intelligence in business management. On the other hand however, there have emerged consultancy companies that provide induction programs into the mysteries of emotional intelligence and its development. A leader has to be emotionally intelligent in order to fine tune his personal objectives and subordinate them to the completion of company objectives.

AIDING AND ABETTING: THE PROBLEMS OF MAINTAINING ADEQUATE ACCOUNTING RECORDS FOR A NON-PROFIT ORGANIZATION IN SUB-SAHARAN AFRICA

John R. Ledgerwood, Embry-Riddle Aeronautical University
Stephen N. Morgan, Fulbright Scholar to Zambia, Africa

ABSTRACT

Designing an organizational accounting system that stands up to the challenges of working in sub-Saharan Africa is difficult for any organization, especially the small scale non-profit that relies on international donations for support. This paper uses the case of Enright Flight Ministries, Inc. a 501(c)3 non-profit organization based in Florida and operating evangelical and humanitarian projects in Zambia. Building upon field interviews with administrative staff and project managers, we analyze the various problems facing the organization in maintaining adequate accounting records. After looking at both external and internal problems, we investigate the solutions employed by Enright Flight Ministries to maintain the integrity of accounting systems to derive best practices for the small-scale international non-profit organization .

JEL: M41 – Accounting

KEY WORDS: Non-profit, accounting issues, Zambia

INTRODUCTION

Maintaining adequate accounting records can be a problem for any non-profit organization. This paper will look at Enright Flight Ministries, Inc. (EFM), a 501(c)3 non-profit corporation which aims to promote Christian evangelism and economic development in Central Africa. Founded in 1992, EFM was designed to be a vehicle through which retired missionaries could continue their work in both Zambia and the Democratic Republic of the Congo with the support of private individuals across the United States. EFM operates out of Daytona Beach, Florida where two non-paid administrators reside. The third administrator is based in Zambia. The Chief Operating Officer (COO) is also stationed in Zambia to oversee all daily operations and the seven additional EFM employees engaged in project support and development. In addition to these individuals, the various field projects employ approximately 150 local Zambians at any given time. The business investments undertaken by EFM are designed to provide goods, services, and training to local populations. Revenues generated from the project portfolio are used to supplement private donations in the support of continued business investment, church building activities, and an intensive annual training program for pastors. The major project activities are focused on five distinct areas: a woodworking factory, aloe vera production, banana production, organic honey apiaries, tilapia fisheries, and poultry/beef production. Drawing on field interviews with the administrators of EFM and its various project managers, we will analyze the problems faced in maintaining strong and accurate accounting practices in the operation of these businesses and the solutions employed to mitigate these challenges.

The Need For Good Accounting Records

Maintaining adequate accounting records is an imperative for any business organization that aims to be profitable, accountable, transparent, and legitimate. For most project managers, having solid and

dependable information is the key to success. Good accounting practices ensure that managers are provided with current records about the state of operations so that correct business decisions can be made. Because of the diverse portfolio of EFM investments, each business venture is responsible for maintaining complete accounting records under the supervision of a project manager. On a recurring basis, EFM conducts internal audits of the records to ensure that good accounting practices are in effect and are reported to the corporation administrators.

EFM also has a moral responsibility to the private donors who support the organization to ensure that accounting procedures throughout the organization are strong and accurate. Recent years have seen increased media attention to non-profit organizations that maintain obscene overhead costs or cannot account for funds received. As donors become savvier, non-profits have begun to provide more information to donors in an effort to increase levels of accountability and transparency. To this end, EFM ensures that complete information regarding any donation can be provided to an individual upon request. Finally, the strongest reason to devote scarce resources to the preparation of sound financial statements derives from the legal and regulatory obligations of the corporation to government. In the case of EFM, the fact that the organization is incorporated in Florida and is funded through private individuals across the U.S. necessitates that EFM file an annual US Information Return with the Internal Revenue Service. Because EFM conducts business activities internationally, there are also regulatory requirements that must be met in Zambia. The Zambian institution charged with collecting taxes and auditing the financial statements of individuals and corporations is the Zambian Revenue Authority (ZRA). The basic requirements imposed by the ZRA are as follows. A corporation is subject to a turnover tax that is divided into two levels. For a "small" corporation with less than \$40,000 in turnover the tax rate is 3% of net revenue. For a "large" corporation with more than \$40,000 in turnover the tax rate is 15% in the agricultural sector and 35% for everything else. The only caveat is that large corporations are permitted to deduct Value Added Tax (VAT) where small corporations are not.

Reporting requirements also differ on the size of the corporation. For a small corporation you are required to prepare monthly financial statements to be filed with an accountant. The main purpose of this law is to ensure that businesses are paying into pension programs for employees. Large corporations are required to file quarterly financial statements and tax payments based upon annual projections. The ZRA requires that each corporation be audited annually by an external accountant who serves as the liaison between the business and the ZRA. All financial records (receipt books, payroll records, etc.) are required to be stored at an external accountant's office. Only after the ZRA conducts an audit with the business accountant is the ZRA legally allowed to proceed to the business site to conduct a field audit.

Problems

As with any international non-profit organization, EFM has faced a significant number of challenges in maintaining adequate accounting systems that meet the needs of project managers, donors, and governments. We choose to look at these problems in two groups - external and internal challenges.

External Challenges

One of the biggest challenges to EFM has been in understanding the often incomprehensible regulatory requirements imposed by the ZRA. As a former British colony, the ZRA has inherited a legacy of bureaucracy that makes it difficult to navigate the filing of annual paperwork without incurring major fines. Even with the services of external accountants, there is a serious problem of information transfer between the ZRA and the businesses and accountants who follow their guidelines. In one such instance, the accountants who conducted the audit felt that there was no need to file a quarterly report since there was no profit on which to pay taxes. During the ZRA audit the accountant's mistake resulted in a hefty fine, further emphasizing the steep learning curve.

EFM must also cope with the monetary uncertainty of conducting business in sub-Saharan Africa. Zambia operates primarily as a cash-based economy, especially in the small-scale agricultural sales of EFM business activities. The largest bill presently in circulation is a 50,000 kwacha note which is valued at roughly ten U.S. dollars. Such denominations mean that EFM is forced to account for massive amounts of cash leaving a large amount of room for accounting errors. Recent reports in Zambian periodicals also suggest that a major revaluation of the currency will occur in mid 2012 to cut three zeroes from each bill. This means that the 50,000 kwacha note will become a 50 Kwacha note, and in the process make it very difficult to maintain accurate accounting during the change.

Historical underdevelopment also contributes to the difficulty in maintaining strong accounting practices because high volumes of business are a relatively new phenomenon. In the past two decades, huge investment in Zambia's mining sector from Asian and European markets have helped to spur a national growth rate in excess of 6%. Rising incomes and an emerging middle class have boosted sales across all sectors of the economy, and both businesses and their accountants are dealing with significantly larger operations than in the past. EFM has found that Zambia's historically small business based economy has made it difficult to find qualified accounting talent to handle larger volume corporations. As noted before, mistakes on the part of the accountant can result in fines and penalties that are imposed with the ZRA. This combination has resulted in significant search costs for EFM in securing a permanent accountant. Zambia's historically "thin" markets for goods and services have produced an underdeveloped banking sector that is struggling to cope with new volumes of financial transactions. In the past year, several of the EFM businesses were required to open new corporate accounts at local financial institutions to facilitate new grants and expanded business activities. From these new accounts, fastest time to completion was six weeks and the slowest was over five months due to a labyrinthine bureaucracy. There is also a significant challenge to EFM accounting records in the transfer of funds from U.S. banking institutions to Zambia. Fees are imposed in the U.S. when funds are sent and in Zambia when funds are collected, representing a significant cost in the management of multiple separate accounts.

Internal Challenges

EFM faces the constant obstacle of balancing the goals of a humanitarian organization with those of a business venture. Managers must constantly evaluate their business decisions to ensure that ventures are economically viable, but that they are also contributing to the overall well-being of the community. These forces are best demonstrated in the wood-shop venture. Manufacturing high-end custom doors, tables, and chairs for sale to private individuals and businesses in northern Zambia is the main goal of the venture and brings in a healthy profit for the business. What happens when another aid activity, say a women's sewing class, needs a table to work on? Should the manager provide a quote that includes a normal markup or should the product be produced for the mission at cost? Under which business is this transaction accounted for? These situations are common in the daily activities of EFM ventures.

Accounting is also made more difficult for EFM due to the limitations of human capital. Because of EFM operations in rural Zambia, agricultural laborers often have very little formal schooling or training in math which can result in significant difficulties in regards to selling, pricing, and inventories. One recent example is in the averaging of weights for the chicken business. The selling price is based on the average weight of a random sample of ten chickens that are taken from each batch of 500. Every day, this sampling procedure is repeated and results are reported to managers. In February 2012, the average weight reported was consistently greater than the weight of any individual chicken. When investigated, it was revealed that the workers conducting the sampling were not aware of how to conduct an average, even after two years of agricultural college.

Besides worker skills, employee character has been a constant problem for EFM operations in Zambia. Managers must be vigilant in maintaining accounting checks in inventory and sales because theft has been a huge problem. In the banana venture this year, there was widespread incidence of theft among the employees charged with sorting the bananas into quality grades of "A", "B", "C", and "no grade". What the graders were doing was assigning high-quality "A" grade bananas into "no grade" crates. Because the low-quality "no grade" bananas are unfit for sale, managers often give them to the employees at the end of the day. In this manner, the employees were smuggling high-quality bananas home, which they were then able to sell for a profit in local produce markets. Other instances of theft have included employees forging receipts, stealing inventory outright, lying about cash advances, and the shorting of change to customers. It requires a significant amount of time and resources for the organization to monitor financial records to both identify and correct these discrepancies.

Employee compensation also presents a challenge for EFM for several reasons. First, Zambian law through the ZRA only allows for the payment of employees on a monthly basis. This requires maintaining huge amounts of cash on hand at the end of each month, and can often delay project activities due to a cash shortage. Second, the businesses struggle with meeting employee needs. This goes back to the idea of balancing for-profit business strategies with the realities of working for a non-profit humanitarian mission. Situations arise among the employees of each business (emergencies, illness, school fees, etc.) where a cash advance is needed. Unfortunately, in sub-Saharan Africa these issues arise on an almost weekly basis creating a nightmare of accounting records because most employee pay is generally already advanced before the end of the month. Finally, because EFM deals almost exclusively in agricultural products, many workers ask to receive a portion of their pay in the product produced. This practice also produces additional paperwork that convolutes the accounting records.

EFM has also had difficulty maintaining field managers over a longer period. This has created significant continuity issues with internal accounting procedures whenever there is the departure by a major staff member. Because each venture is compartmentalized in operations, there has been no back-up solution or succession plan in place for lower level managers. The case in point for EFM has been the wood-shop, which has gone through a series of four managers in under ten years. Each shift has left the finances in disarray and caused EFM to bear greater costs when preparing the venture for a replacement manager.

Solutions

For EFM, there are no simple solutions to the external challenges to maintaining adequate accounting records in sub-Saharan Africa but there are some significant steps that can be taken to mitigate external risk and correct the internal problems. One major step is to use the services of two independent accountants in Zambia. An internal accountant who conducts audits and prepares reports for project managers has now been hired by EFM. This internal accountant is the first barrier against the often incomprehensible laws and accounting mistakes that can result in significant fines. When the internal accountant runs up against an issue that is not fully understood, it provides EFM with advance warning to determine the appropriate actions and paperwork needed to rectify a problem before it reaches the ZRA. This is where the services of the second accountant come into play. The second accountant for EFM works in an external office, and the project managers use reports from the internal audits in their meetings here. The external accountant serves as an important second opinion and is the liaison between EFM and the ZRA. Having both an internal and external accountant helps to minimize the risk of misunderstandings and fines. Doing this is crucial to create a central record and institutional memory of good accounting practices that can be maintained with the departure of key EFM staff members or accountants. Having these two individuals working for EFM will also help to develop the accounting skills necessary to handle the ever increasing quantities of business transactions.

Until Zambia improves the state of banking and finance, large amounts of cash and the fees associated with cash transfers from the U.S. will remain an operating reality for EFM activities. This is why a significant second step for EFM has been maintaining the services of an accounting firm in the U.S. as a means to adequately account for all funds received from U.S. donors and to prepare the annual U.S. Information Return for EFM. Having a U.S. based accountant is imperative to provide financial information to interested donors and to facilitate the cash transfers to Zambia in the lowest cost manner. EFM attempts to send money in the fewest number of transactions possible to minimize the fees incurred at the bank and maximize the funds available for project implementation. At the same time, holding most of EFM resources in U.S. dollars is a sound strategy that allows the non-profit administrators to mitigate some of the risks and uncertainty associated with the Zambian kwacha. EFM has moved the responsibility for cash accounting onto the managers of each separate venture. At the close of each business day, each manager must reconcile inventory, sales, and cash receipts for review by the internal accountant the next morning. When a discrepancy arises, the internal accountant notifies the relevant manager, who now has the ability to investigate the problem immediately. In addition to managing the large amounts of currency on hand, this process helps to safeguard against the problem of employee theft.

In regards to employee skills, EFM has instituted numerous training programs to help boost the language and business abilities of employees to prevent accounting or business errors that arise from miscommunication and human error. One of the most popular efforts has been the formation of English classes for beginners and advanced speakers. These classes are open to employees of all EFM ventures and occur twice each week. Additional training classes are conducted weekly by managers of the individual ventures. Every employee of that venture is required to attend, and they spend time teaching each worker how every aspect of the business operates. These sessions are useful for teaching the skills required for each employee position (mathematical, technical, accounting, etc.) and serve as an important mechanism for building a relationship of trust and accountability between the managers and the employees. EFM feels that training sessions are the best vehicle to combat failings in the character of the employees and lower the incidence of theft. If the organization is transparent and makes an effort to supply full information to the employees they will be less likely to try to steal because they feel like an integral part of the business activities.

Fostering ideas of community ownership, teamwork, and camaraderie are central to this effort and supplemented by external activities such as employee dinners, picnics, and celebrations. EFM has also come up with a novel means to address the accounting issue of the single pay period per month. For several of the businesses, every employee now receives a portion of their pay, about 30%, in the form of a cash advance during the second week of each month. This allows the ventures to meet the needs of employee requests for advances while also reducing the amount of cash that must be on hand for payroll at the end of the month. This practice falls entirely in line with Zambian law for employee compensation and has been a large success among workers. It has also streamlined the accounting process because there is not an individual cash advance for each employee, but a standard amount across the board. Also streamlining the process of paying employees in agricultural products has been a new EFM policy where employees are allowed to receive a fixed amount of their salary in the form of finished product. This practice only extends to employees of the relevant venture. For example, a worker in the chicken business can receive part of a salary in the form of three chickens but cannot receive part of the salary in the form of fish. This has cut down on confusion (and discord) that arises between the separate ventures, and has gone a long way to improving the clarity of accounting records .

CONCLUSION

Maintaining adequate accounting records requires the significant investment of time and resources for any organization. For Enright Flight Ministries, Inc. this responsibility is especially important in an effort to

be transparent for private donors, meet the legal obligations of the various countries where operations take place, and to ensure that program funds are used to meet the humanitarian goals of the organization. EFM faces a myriad of challenges to maintaining strong accounting records. Cash based economies, currency uncertainty, and historical under-development, are the biggest external problems. Internal problems include balancing business goals with humanitarian goals, limited employee abilities, and payroll management. EFM manages external challenges through the use of a two accountant system in Zambia and the services of a U.S. based accountant to mitigate the risks associated with international operations and foreign currencies. Internally, the compartmentalization of business ventures under the leadership of project managers has led to a more horizontal business structure that allows for greater monitoring and accountability within the business. Additionally, significant investment in employee training and knowledge sharing are used to combat the prevalence of low education among workers and poor character. From this case we believe the most significant lessons for small-scale non-profit organizations can be derived from the implementation of a system of checks and balances that include accountants in each country of operations. Too often, the managers of non-profit organizations are so involved in the implementation of projects or other humanitarian efforts that they are not equipped with the time or knowledge to fully understand the nuances of accounting law applicable in the region. Having accountants in both the U.S. and Zambia allow EFM to satisfy responsibilities to donors and governments in a professional and timely manner, with minimal waste of scarce aid dollars.

This system extends into the system of checks permitted by the close interactions of project managers with an internal accountant who works in the field. This system has provided EFM managers with extremely reliable financial reports that have been invaluable in the preparation of annual budgets and sales projections to solicit new donors. Additionally, it prevents accounting errors in one business venture from permeating through the entire organization because the internal accountant has the opportunity to correct bad practices at an early stage. The key to maintaining adequate accounting records in sub-Saharan Africa is to design an accounting system that is able to efficiently adapt to the harsh realities of operating in the developing world.

BUSINESS ETHICS AS AN ACCREDITATION REQUIREMENT: A KNOWLEDGE MAPPING APPROACH

Albert D. Spalding, Jr., Wayne State University

Rita A. Franks, Louisiana Tech University

ABSTRACT

Most of the more prominent and highly ranked business and management schools in the United States and elsewhere are accredited by one of two international accrediting organizations, the Association to Advance Collegiate Schools of Business (AACSB) or the Accreditation Council for Business Schools & Programs (ACBSP). Both of these organizations require the inclusion of business ethics in the curriculum of each accredited institution. "Business ethics," however, is a concept that includes, overlaps or integrates with such notions as social issues in management, corporate social responsibility, corporate citizenship and sustainability. Larger disciplines such as philosophy, psychology, the social sciences and even religion can also impact and interact with business ethics. This paper uses knowledge mapping to organize the various pockets of knowledge that comprise the business ethics domain, relying in part on traditional library science classification systems. The paper concludes that the accreditation regime would benefit from a more carefully constructed articulation of the content of business ethics.

JEL: A2, M14, Z12

KEYWORDS: Business ethics, accreditation, knowledge mapping, philosophy, religion.

INTRODUCTION

There are two international accreditation bodies for higher education business schools, the Association to Advance Collegiate Schools of Business (AACSB) and the Accreditation Council for Business Schools and Programs (ACBSP). Both of these organizations require business schools to incorporate ethics into their curricula. The standards put forth by the AACSB are more detailed than those put forth by the ACBSP. Under the AACSB approach, ethics education is required as part of the general knowledge and skills portion of the standards for undergraduates, and in the management-specific portion of the standards for undergraduate and master's students. Ethics education under this regime involves four subject areas: (a) responsibility of business and society, (b) ethical leadership, (c) ethical corporate governance, and (d) ethical decision-making (2004). Under the ACBSP regime ethical issues are expected to be addressed within several contexts. For example, business ethics is considered to be part of a member school's education in regard to the impact of business on society. In addition, the standards require that ethical awareness and global awareness be included in the student skills that are assessed by member schools. Business ethics is also included as part of the common professional component of a typical business school curriculum (2011). Despite these accreditation requirements, the content of business ethics is not specifically defined or circumscribed by either of the major business school accreditation bodies.

In their glossary section, for example, the ACBSP provides a definition of ethical behavior that refers to how organization insures that all its decisions, actions and stakeholder interactions conformed to the organization's moral and professional principles. Even though the ACBSP standards acknowledge that an organization's "moral principles" define right and wrong, the standards do not require instruction in moral theory *per se*, and the standards do not offer any guidance as to how those moral and professional principles are or ought to be derived (ACBSP, 2011, p. 62). Similarly, the AACSB standards suggest that students should be provided with the opportunity to learn and practice "multiple models for ethical

decision making” as an important step in supporting their ability to make good personal choices and business decisions in the future (AACSB, 2004, p. 18). As an assurance of learning guideline, the AACSB offers as possible learning goal the ability of students to “identify an ethical dilemma in a scenario case and apply an ethics model or framework to propose and defend a resolution” (AACSB, 2007, p.7). No guidance is provided as to which models ought to be considered, or what content should be included. The possible depth and breadth of required ethics education is also not addressed.

As a result of the vagueness of the ethical standards of business school accreditation agencies, the idea and the ideals of business ethics may have been somewhat diluted. Various notions such as corporate social responsibility, corporate citizenship and social issues in management are accommodated under the broad umbrella of business ethics, but the theoretical connections between these larger social concepts and business ethics proper are not always articulated. This paper serves as an effort to sort through the various overlapping ideas that comprise the current business ethics pedagogy, in an effort to highlight the components and characteristics of the body of knowledge of business ethics proper. We employ knowledge mapping as it used in such fields as library science and the social sciences in this effort.

LITERATURE REVIEW AND BACKGROUND

Business Ethics As An Accreditation Requirement

Heller and Heller (2011) examined the standards established for business ethics education in AACSB accredited programs, and reviewed AACSB accredited business school courses to determine if they were addressing the standards set by the accreditation body. The researchers examined business ethics course content, syllabi, textbooks and related readings. Their content analysis of 50 ethics courses revealed that the four broad AACSB themes (responsibility of business and society, ethical decision-making, ethical leadership, and corporate governance) were inconsistently addressed in the courses examined. Ethical decision-making had the lowest scores. Perhaps most significantly, the authors found that most of the discourse that took place around applied ethical decision-making involved very little reference to theoretical ethical foundations of decision-making. Heller and Heller’s quantitative analysis of the content of ethics education in business schools study confirmed many of the expressions of concern that had already been proffered by other observers. Lowrie and Willmott (2009), for example, pointed out that “there is no core curriculum for, or minimal level of provision of, for example, ethics education” (p. 414). Swanson (2004) was more blunt, asserting that:

AACSB can give its stamp of approval to the most superficial coverage of ethics in MBA and undergraduate degree programs, such as the promise that ethics will be mentioned in a few courses and/or condensed into a two-week seminar for new students. In other words, AACSB’s allegiance to flexibility is a loophole through which ethics can be slipped out. It is a green light that ethics can be strewn across curriculum, even haphazardly, and delivered by professors who have plenty to do without trying to learn practical applications of a 2000-year-old moral tradition of Western philosophy (p.49).

Some have attributed this apparent ambivalence toward specific ethical content or curricular standards to a shift in focus on the part of accreditation bodies. The AACSB, in particular, changed from a model requiring universally applied standards, to a mission-linked model incorporating a peer-review process with a more recent emphasis upon continuous improvement in achieving the school-specific mission (Lowrie & Willmott, 2009, p. 414). This shift to a mission-linked approach has resulted in the erosion, if not elimination, of any core business ethics curriculum, and it seems to reflect an institutionalized inability or unwillingness to fill this vacuum with AACSB-preferred recommendations or guidelines (Lowrie & Willmott, 2009, p. 415). Swanson and Frederick (2003, p.26) have also suggested that an

added consequence of the mission-linked approach is that it contributes directly to reducing or eliminating the number of professors teaching ethics in business schools.

Others, such as Francisco *et al* (2008) have expressed a high degree of cynicism toward the AACSB's commitment to ethics education generally, suggesting that ethics (like the use of technology and the internationalization of the curriculum) is a subject area that comes into vogue from time to time but is not necessarily a core component of business education (pp. 25-26). Meanwhile, business schools are often blamed for ethical lapses by their alumni. For example, in a survey conducted by the *Harvard Business Review* on whether business schools are to blame for the current global crisis, 67 percent of the respondents felt that business schools were at least partially responsible for the ethical and strategic lapses of their graduates (Podolny, 2009).

Prior Descriptions of the Components of the Business Ethics Domain

Kahn (1990) conceptualized the content of business ethics after interviewing business ethics researchers. He organized the field's concepts into two general categories, normative and contextual (p. 312). Normative concepts represent a focus on how individuals "ought" to behave, given normative standards and justifications of morality, i.e., such Enlightenment theories as utilitarianism, Kantian ethics and deontology (p. 312). Contextual concepts focus on organizational climate and culture, corporate governance, work group segmentation and organizational behavior. Nicholson's (1994) taxonomy of business ethics writings involved four categories: texts, essays, results of surveys, and popular writings. He found that the format of business ethics textbooks "typically comprises a high-speed tour of ethics philosophy, a high-speed tour of ethical philosophy, followed by discussion of common ethical dilemmas and case examples, concluding with a review of strategies on themes and issues such as pollution, safety, business conduct and the like" (p. 582). By comparison, the essays and empirical research categories emphasized sociological, psychological, organizational behavior, economic and cultural/anthropological studies (pp. 582-583). The popular writings were generally "aimed at the managerial market, with the avowedly missionary intent of raising the ethical tone of business conduct" and with the general theme that "good business is good for business" (p. 582). Nicholson acknowledged that "Underlying these four strands of writings is a vast body of more disparate and discipline-specific literature" including philosophical literature that incorporates concerns and theories about justice, rights, utilitarianism, theism, humanism, ideology and dialectics (p.582).

As part of their effort to develop their "Walk the Talk" case-based approach designed to help students develop personal ethical agency, Matherne *et al* (2006) organized the various approaches to ethical decision-making around seven domains: utilitarianism, virtue, moral duty, rights, justice, caring and religious ideals. These seven domains were, in turn, consulted by students as they discussed and attempted to resolve various business ethics issues arising from real and hypothetical cases.

These and similar previous efforts at taking into account the content of business ethics are not themselves efforts to map the conceptual domain of business ethics. They are not intended to serve as guidance for and articulation of the appropriate content of business ethics in view of the accreditation standards. This paper, by contrast, will look more directly at the components of business ethics in an effort to initiate a discussion about what should be included under the banner of business ethics at accredited institutions.

Business Ethics without Rigorous Ethical Theory

The paucity of content guidelines on the part of the accreditation agencies may be part of a structural problem of business ethics education. At its deepest levels, ethics addresses behavioral norms which, in turn, represents some of the highest aspirations in society. These include values such as respect for human dignity, justice, freedom, and liberty (Bird, 1996). Ethics has been defined as "the study of what is good

or right for human beings. It asks what goals people ought to pursue and what actions they ought to perform” (Hoffman & Moore, 1990, p.1). Business ethics is an applied ethics discipline, and is built on the same foundation of moral philosophy as is ethics proper. As Dienhart and Curnutt (1998) observed, “The roots of business ethics are in philosophy, theology, and in the business community itself” (p.2). As in the case of ethics generally, business ethics uses logic, reason, faith, and/or tradition, to address many issues involving difficult decisions concerning business situations (Hunt, 2000). The lack of emphasis on ethical theory in business ethics education, however, has been the subject of consistent criticism, as described by Anninos and Chytiris (2011):

Incomplete theories, unquestioned assumptions by management practitioners and scholars and the "bottom line" culture have stripped business education off its ethical dimension and have degraded management, from a comprehensive to a technocratic knowledge corpus, whose consequences are often combined with complaints that management educators fail to meet corporate needs (p. 884).

Anninos and Chytiris suggest that the humanities have much to offer in adding depth and dimension to ethical epistemology, and propose that training in philosophy, logic and classical studies be added to the ethics education of business students (p.888). They conclude that by “reflecting on classical works, building virtues to students, cultivating logic, teaching management through philosophically sound rudiments and researching for solving true business problems, the first step for excellent business education will have been achieved” (p.889). A widely cited definition of the moral domain is that of Turiel’s (1983, p.3): “prescriptive judgments of justice, rights, and welfare pertaining to how people ought to relate to each other.” For Turiel, morality pertains mostly to the consequences of interactions between people. This somewhat narrow view of morality results in ethics being understood largely in terms of “do no harm” and not in terms of “do no evil.”

Seemingly harmless offenses are rarely condemned under this definition, even when they are disgusting or disrespectful (Haidt, Koller, & Dias, 1993). In recent years, however, there has been a broadening of the scope of the moral domain, in the view of many researchers and scholars, beyond analysis of actions that result in empirically measurable negative consequences. One of the reasons that ethics is viewed as a discipline that overlaps such domains as philosophy and religion is that for many people ethics is not limited to such a consequentialistic “do no harm” paradigm. As Joseph and Haidt (2007, p. 239) observed, “Even a cursory look at foundational religious texts reveals that, while God or the gods do seem to care about whether we help or hurt each other, they care about many other things besides. It would be a gross misunderstanding of ancient Judaism, for example, to describe the Ten Commandments as a mixture of moral rules (about not stealing, killing, or lying) and social conventions (about the Sabbath, and prescribed ways of speaking and worshipping.)”

Business Ethics Diluted by Other Related Subject Areas

The lack of content guidelines on the part of the accreditation agencies may be part of a structural problem of business ethics education. As a result of this vague guidance provided by the accreditation agencies, business schools are not required to focus on traditional concepts of moral philosophy and ethics. Instead, related subjects such as corporate social responsibility (CSR), global corporate citizenship, sustainability, social issues in management, organizational behavior and management science compete with business ethics proper for attention by business faculty. In many colleges and universities, faculty who are experts in accounting, finance, management, marketing, information systems and other disciplines are called upon to incorporate ethics into their courses. Most of these instructors are experts in their specific fields, but do not have formal training in ethics.

Business ethics can be properly distinguished from other subjects such as corporate social responsibility (CSR) and sustainability. Christensen *et al* (2007) define business ethics as a form of applied ethics that emphasizes the examination of ethical rules and principles within a commercial context, taking into account the various moral or ethical problems that can arise in a business setting as well as any special duties or obligations that apply to persons who are engaged in commerce (p.351). CSR, by contrast, pertains to voluntary actions taken by a company to address economic, social, and environmental impacts of its business operations and the concerns of its principal stakeholders (p. 351). Sustainability refers to the contributions of business to an equitable and ecologically sustainable economy by offering products and services that fulfill society's needs while contributing to the well-being of the earth's inhabitants (p. 351). In their content study of ethics and ethics-related courses at top MBA programs in the United States, Christensen *et al* (2007) found that of the 75% of such programs that required ethics study, only 5% did so by way of a separate ethics course in their curriculum (pp. 3541-352).

The other programs combined ethics with CSR, leadership or other subjects. For the most part, ethics was not labeled or taught as a stand-alone topic within these latter mixed courses. In other words, there was not a separate focus on ethical theory or principles. Early business school programs grew out of a traditional liberal arts background and often included a course in moral philosophy in their curricula. That course was often required as a capstone course at the end of a student's program and was in many cases taught by the school's president (Pamental, 1988). More recently, most undergraduate courses business ethics courses continue to be taught at the freshman and sophomore level by faculty from philosophy departments, while most graduate level courses that focus on business ethics are taught by business faculty (Pamental, 1989). McDonald and Donleavy (1995) have observed that there is often a reluctance among business school faculty, if not overt resistance, to the teaching of business ethics.

The oft-stated criticisms range from the view that business ethics does not focus on profit-maximization and is therefore not seen to be part of the domain of business, to the pragmatic difficulties of introducing business ethics into existing business school curricula (p.842). There is also an ambivalence toward the subjects of philosophy and religion, which overlap normative ethical and moral principles of right and wrong. Philosophy and religion, it is argued, are theoretical, while business ethics is more practical subject that does not benefit from such lofty viewpoints. McDonald and Donleavy (p. 846) point to McCoy's (1983) assertions in this regard:

A well-led course in business ethics should impart self-confidence in dealing with ethical issues without formal philosophical or theological training. To suggest otherwise removes ethics from day-to-day normal activities (McCoy, 1983, p. 22).

The antipathy toward philosophy and religion as expressed by McDonald and Donleavy, and by McCoy, is not universally shared by business ethics scholars. Klein (1998) contends that McDonald and Donleavy, in particular, are:

simply out of line with respect to this caricature of philosophers – as not having any conception of the "real world." This criticism is as old as Plato and more hackneyed. It is so misconceived that I am surprised that it is still being bandied about. This shows me that the members of the academic business community are seriously out of touch with what is going on in both the scholarly pedagogical literature as well as the contemporary business ethics classrooms of people like De George, Robert Ladenson, Norman Bowie and Patricia Werhane (p. 568).

Klein suggests that philosophy and the philosophical method of inquiry are essential to the study and teaching of business ethics, so much so that the AACSB standards requiring coverage of ethics in the common body of knowledge cannot be met without the intentional incorporation of philosophy (p. 563).

Knowledge Map of Business Ethics

We believe that Klein's claim, that philosophy forms the foundation of business ethics, is a good starting place for rediscovering the essential content of business ethics. Ethics, after all, can be simply defined as moral philosophy, and at its deepest level ethics represents the highest aspirations of humanity (Bird, 1996). The question that we face, however, is how to unravel the various themes, causes, special interests and perspectives that are intertwined with the idea and ideals of business ethics *per se*. In order to begin to find an answer to that question, we turned to the technique of knowledge mapping.

Knowledge maps are node-link representations in which ideas are located in nodes are connected to other related ideas through a series of labeled links. Knowledge maps can be used as primary sources for knowledge acquisition, adjunct aids to text processing, communication tools for organizing ideas, or retrieval cues (O'Donnell *et al*, 2002, p.74). Knowledge maps have been employed in many contexts, including systems support (Ebener *et al*, 2006), information science (Zins, 2007), technology management (Pelc, 2002), knowledge management (Wexler, 2001) and library science (Chaudhry & Higgins, 2003). In their effort to map the moral domain, Graham *et al* (2011) revealed that “moral considerations beyond the individual-based concerns of harm and fairness, involving concerns about spiritual purity and degradation (even for acts that involve no harm), concerns about proper hierarchical role fulfillment, and moral expectations of loyalty to the local or national group” (p.367). The authors noted that participants in morality studies tend to think of morality and ethics in terms of harm-avoidance, but also in terms of duty, obedience, respect, and the preservation of tradition, irrespective of the presence or lack of specific measurable consequences of behavior. Many participants also made references to God or religious norms, decency, the soul, and the maintenance of purity for its own sake. Graham *et al* concluded that scales that attempt to measure morality by assessing attitudes about harm and fairness are thus leaving out much of what people – including Westerners and non-Westerners – explicitly and spontaneously include in their descriptions of the moral domain (p.367).

Our methodology in this study involves the construction of a rudimentary knowledge map for business ethics. We first consider the theoretical and practical implications of Graham *et al* (2011), whose effort to map the moral domain addressed the scope of psychological views of morality while taking into account demographic and cultural differences in moral intuitions. These researchers observed that the moral domain is broader than “empathy” and “justice” concerns assessed by existing moral competence, and that it is not just a subset of the values assessed by value inventories. With that study as a backdrop, we use the knowledge mapping techniques that have been developed and employed within education and related fields (McCagg & Dansereau, 1991; O'Donnell 1993).

Dewey Decimal Classification System

One approach to the organization of ethics-related knowledge involves the emulation of the classifications of knowledge under library systems such as the Dewey Decimal Classification System (DDC). That system arranges theoretical knowledge into four parts: the realm of reason (wherein the mind attempts to understand itself and the spiritual and physical world outside of itself); the realm of imagination (wherein the mind produces literary inventions regarding life, no matter how much based in fact); the realm of memory (where the mind records events and conditions regarding the life of the planet and of humanity); and all other topics not included in these three realms (Scott, 1998, p. 13). Under the DDC, ethics proper (that is, moral philosophy) is classified under the realm of reason in the larger category of philosophy and psychology (i.e., the 100's). Ethics-related subjects such as metaphysics, epistemology, humanism and related systems, pantheism, and moral development reside within this category.

The DDC accommodates specific sub-categories of ethics, including ethics of recreation and leisure, ethics of sex and reproduction, ethics of social relations, ethical consumption, and other ethical norms.

Ancient Greek systems such as Epicurean philosophy and Stoic philosophy are included with MIDI evil Western philosophy, modern Western philosophy, and related topics.

By comparison, the DDC classifies the subject of "good and evil" under the larger category of religion (i.e., the 200's), rather than philosophy and psychology. All of the subject areas normally associated with religious studies, including philosophy of religion, sacred texts, moral theology, comparative religion, and the historical development of world religions are included within the category of religion proper. The social sciences (except psychology) comprise the third larger category (i.e., the 300's). Various social issues such as civil rights, slavery and emancipation are included. Social policies, such as socialism and related systems, law and legal studies, social services, social welfare problems, criminology, and customs and etiquette are folded into this third category. Also included among the social sciences are management-oriented disciplines such as management science and organizational behavior.

Specific ethical issues, norms and applications are sprinkled throughout the remainder of the DDC. For example, research ethics affects nearly every area of knowledge. Applied arts such as architecture necessarily take into account the ethics of accommodating human needs (including the needs of those with disabilities), and also take into account religion and religious symbolism where appropriate. For the most part, though, ethics, understood in terms of the engagement of principles of right and wrong, are ensconced in the first three larger categories of knowledge described above. Each of the three larger categories of knowledge includes a robust body of ethical content. There is a significant amount of overlapping among them around the notion of ethics within the DDC. A helpful way to visualize the interaction of these three larger categories of knowledge within the DDC would be to depict a Venn diagram wherein ethical principals are found at center of several overlapping circles, as in *Figure 1*.

Dewey Decimal Classification (DDC) Knowledge Domains.

Figure 1.

Library of Congress Classification of Knowledge Domains

The Library of Congress classification scheme (LOC), like the DDC, organizes knowledge around major categories, and then subdivides those categories. In comparison to the DDC, the LOC classifies the social sciences in one large category (Class H.), but combines philosophy, psychology and religion in a single large category (Class B.). Within class B., however, there are subclasses for the history of philosophy,

speculative philosophy (including metaphysics and epistemology), psychology, ethics, religion, theology, and religious denominational studies. The ethics subclass includes general works on ethics, history of ethics, religious ethics, evolutionary and genetic ethics, positivist ethics, socialist and communist ethics, feminist ethics, professional ethics, and etiquette. Even though ethics is ensconced in its own subclass, many of the other subclasses noted above include subject matter that overlaps with ethics.

Class H., the social sciences category, includes various topics that intersect with ethics. These include business ethics, sexual ethics, mental and moral life, workplace etiquette and, as in the DDC, a variety of social issues that brush up against ethical principles. Similarly, Class K., Law, takes into account moral and ethical issues pertaining to public policy, specific legal systems (including canon law and Islamic sharia law), corporate governance, the ethics of jurisprudence, and professional legal ethics. Moral education, character building, and related subject areas are included in Class L., Education. *Figure 2* depicts the interaction of these categories of knowledge within the LOC by representing several overlapping circles.

Library of Congress (LOC) of Knowledge Domains.

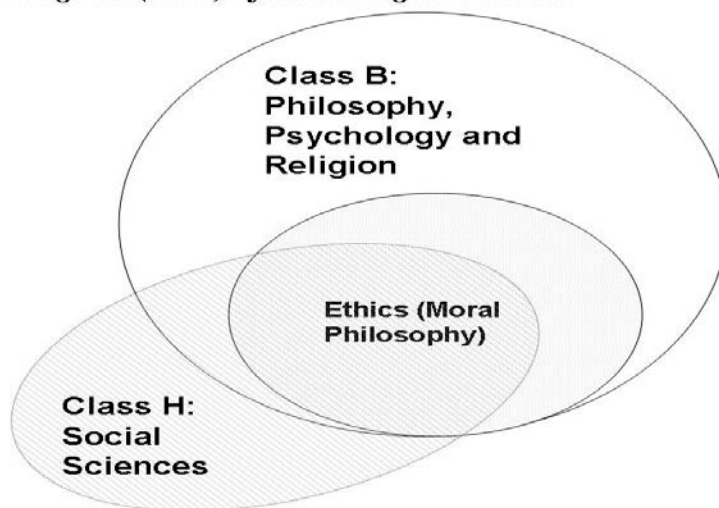

Figure 2.

Other Classification Systems and Approaches

Two other library classification systems were considered as part of this study. The Universal Decimal Classification system, used primarily outside of the United States, is based on the DDC (Harper, 1954), and categorizes ethics-related topics in the same manner as the DDC. The Colon Classification, also used primarily outside of the United States, resembles the LOC in its organization and structure (Satija, 1990 & 2002), including its manner of taking into account ethics-related subjects.

What About The R-Word (Religion)?

One of the advantages of using knowledge mapping is the manner in which the technique highlights conceptual relationships that are not necessarily intuitive or even particularly rational. As a result of our effort here, we note that there is a significant amount of overlapping between moral philosophy and religion (or religious studies, or theology). Business ethics and religious notions are seldom paired in the modern Western thought, but they are not so severely segregated in other cultures. We find this outcome

of our study to be interesting in two ways: first, it raises the question as to whether there has been too much effort to ban religion from the discussion of business ethics in the Western business schools; and second, it raises the question as to whether modern Western efforts to ensure the secular goal of objective education has created an environment where those for whom ethics and faith are not separated and compartmentalized find themselves at odds the prevailing tone of the business ethics classroom. The former is a question of intellectual honesty and open-mindedness, and the latter is a question of multiculturalism and the accommodation of intellectual diversity. Prowse (2002) claims that we are living “in times that might aptly be called ‘post-ethical’” (p.2). He suggests that people still use moral language, but that they have increasingly stopped believing that it has any objective foundation. In other words, Prowse believes that people today are for the most part emotivists, that is, that they increasingly treat moral judgments as no more than personal expressions of approval or disapproval:

That being so, many people's behaviour is now guided almost exclusively by prudential considerations: in other words they obey the law, help others and respect customs and mores only if they calculate that this will benefit them personally in some way. They do not accept the validity of "oughts" or "shoulds". On this view, "doing one's duty, regardless of the personal cost" is a philosophy to which only fools should subscribe. (p.2).

Prowse proposes that a waning of religious faith in Western culture is the ultimate cause of the loss of ethics:

What accounts for this hollowing out of morality, for this loss of belief in objective ethical standards? Why are so many people de facto emotivists? The growing authority of empirical science and the loss of faith in religion are partly responsible. If people believe the world consists of nothing but tiny particles or quantum wave functions, why should they treat ethics as anything but a matter of taste? (p.2)

If Prowse was right, the fading of religion might well be a mixed “blessing.” As Glover (2000) has observed:

Those of us who do not believe in a religious moral law should still be troubled by its fading. The evils of religious intolerance, religious persecution and religious wars are well known, but it is striking how many protests against and acts of resistance to atrocity have also come from principled religious commitment (p. 405).

The research of Evans *et al* (2006) demonstrated that religious affiliation is highly influential in determining the amount of ethics content in the curriculum. Comegys (2010) also found evidence that students attending religiously affiliated colleges and universities may have more ethically inclined attitudes about business, and concluded that the religious orientated climate at such institutions may influence the attitudes of these students. In any event, it may well be a mistake to attempt to ban religion from the domain of business ethics for both conceptual and practical reasons. In this regard, Caroline Whitbeck (Glagola *et al*, 1997) makes an interesting observation. She argues that the use of traditional secular theories of ethics (utilitarianism, Kantian duty-based ethics, etc.) actually alienates students. She notes that by using these theories, students are taught to choose their theory, restrict their vocabulary, and then defend that position within the constraints of that theory, rather than to examine all morally relevant considerations (p.446). Irrespective of the extent to which specific religious tenets accommodate promote diversity, respect for religious views is a diversity issue. Indeed, diversity can be properly defined to include “real or perceived differences among people with regard to race, ethnicity, sex, religion, age, physical and mental ability, sexual orientation, and family status that affect their treatment, opportunities, and outcomes” (Bell *et al*, 2009, p. 598).

CONCLUSION

Knowledge mapping is a helpful technique for the identification, definition and taxonomy of components of business ethics. By working from well-established categories of knowledge as used in the field of library science, we have demonstrated that business ethics is a field that draws from both the humanities and the social sciences. Any effort to focus on one without the other will result in something less than the optimization of the knowledge base of this important domain. As an example of the benefit of knowledge mapping, we have been alerted to the possible neglect of some of the metaphysical aspects of business ethics. In particular, business ethics educators risk alienating some of those students whose moral epistemology is informed by faith (including both Western students of faith as well as international students whose cultural backgrounds include Islamic, Buddhist, Hindu, Christianity and other religious influences). A robust discourse in business ethics can, and in many cases should, allow for the possibility that students of faith have something to say about issues of right and wrong behavior in the marketplace. This widened discourse will not only serve to be more respectful of those students, but it will likely enrich the business discourse itself. Along the way, business ethics research and scholars should probably lead the way in helping to push accreditation guidelines toward more structure and more specific content. In so doing, related subjects such as corporate social responsibility, social issues in management, business and society, and sustainability need not be weakened. Indeed, the first principles that can be promoted by theoretically diverse and strong business ethics, will likely strengthen these related subjects as well.

ABSTRACT

This research studies firm size stock index using Taiwanese stock market companies (listed and over-the-counter) and their market value as proxy variable for firm size. Samples were sequenced according to lowest turnover and divided into 10 groups each with 110 companies using Taiwan Capitalization Weighted Stock Index to calculate the indices of different firm sizes. EGARCH was used to analyze the asymmetric volatility, and the results show that small scale stock indices have no asymmetric volatility during the pre-financial tsunami period, and that of medium and large scale indices showed significant decrease during post-financial tsunami period.

KEY WORDS: financial tsunami, size index, asymmetric volatility, EGARCH

INTRODUCTION

The diversification of investment channels in recent years has made the strengthening of asset risk management necessary. Past studies used rate of return to explain risk. However, Fama (1971) pointed out the relationship between risk and rate of return, and risk became a factor in explaining rate of return. Yet there is a need to find a suitable proxy variable for risk. Most conventional financial literatures support using volatility as proxy variable for risk. Asymmetric volatility occurs when new information brings about price volatility. When the new information is positive, the volatility of the prices in the future is smaller; when the new information is negative, the volatility of the prices in the future is bigger. Whether there will be a significant difference in asymmetric volatility within the same market with different firm sizes in the post-financial tsunami period became the objective of this paper. Stock market prices and turnover are high frequency financial time series data. Because linear models would be unable to handle the leptokurtosis and volatility clustering of financial time series (Brooks, 2002), a non-linear model, such as the Autoregressive Conditional Heteroskedasticity (ARCH) model and the Switching Model, must be used instead. The ARCH model was proposed by Engle (1982). Bollerslev (1986) expanded this into the GARCH (Generalized ARCH) model but because the GARCH model could not differentiate between the impacts to volatility of positive and negative information (i.e., asymmetric volatility), Nelson (1991) developed Exponential GARCH (EGARCH). Campbell and Hentschel (1992) then used the Quadratic GARCH model (QGARCH) to fit asymmetric volatility scenarios. However, Engle and Ng (1993) discovered that EGARCH had a better fit than QGARCH. Hafner (1998) also proved that EGARCH was more superior in fitting the volatility of high frequency data.

METHODOLOGY

The financial tsunami started with the subprime mortgage crisis in the United States. After New Century Financial declared bankruptcy on April 2, 2007, the global stock market suffered a huge bear market on July 27, 2007 due to the US subprime mortgage problem. Taiwan's Weighted Stock Index indices were greatly affected, dropping by 404.14 points. This also triggered many bankruptcy declarations and bank takeovers in the United States in 2008. The financial tsunami was triggered when Lehman Brothers

declared bankruptcy on September 15, 2008. The Taiwan government implemented a series of measures to support the market but it still dropped by 258.33 points. Europe also had a debt crisis in 2009 and 2010. Thus, 2007 to 2010 is dubbed the financial tsunami period. Taiwan's stock market was greatly affected. This paper primarily studies the changes in volatility of the Taiwanese stock market before and after the financial tsunami. Data between September 1, 2007 and August 31, 2010 and between September 1, 2003 and August 31, 2006 were gathered from Taiwan Economic Journal Data Bank (TEJ) for the post- and pre-financial tsunami analyses, respectively. For the pre-tsunami period, 860 companies were selected as samples, while for the post-tsunami period, 1100 companies were selected as samples. These samples were divided into 10 groups each with 110 companies. Companies with the biggest firm size comprised the large size stocks; companies with the smallest firm size comprised the small size stocks. The medium size indices were selected from the latter half of the fifth group and the former half of the sixth group. For the pre-tsunami period, 110 companies from each type were selected, so the first 110 companies with the biggest market values were classified into large-sized stocks, while the last 110 companies with the smallest market values were classified into small-sized stocks. Companies with sequence numbers 376 to 485 based on market value were classified as medium-sized stocks. The calculation method for Taiwan Weighted Capital Index was applied in calculating for the indices. The equation is as follows:

$$I_i \equiv \frac{\text{Total Market Value of Stocks Per Size Type}}{\text{Total Market Value (base period)}} * 9000 \quad i = B, M, S \quad (1)$$

Using the first day of post-financial tsunami (September 3, 2007) as the base period, the index for the base period per size type was set as 9000 for the calculations (the selection of base period and indices does not affect the results). Based on the trends in each period for each size type (not shown), it can be observed that during the pre-financial tsunami period, the trends of the indices in each type were considerably stable. However, during the post-financial tsunami period, the volatility of the indices significantly increased. The rate of return was calculated from the natural logarithm of the daily close index at t day divided by daily close index at $t-1$ day, multiplied by 100. The rate of variation for the trading volume was obtained by the natural logarithm of the total trading volume on t day divided by the total trading volume on day $t-1$, multiplied by 100. The equations are shown below:

$$r_{i,t} = \left[\ln \left(\frac{I_{i,t}}{I_{i,t-1}} \right) \right] \times 100 \quad (2)$$

$$v_{i,t} = \left[\ln \left(\frac{V_{i,t}}{V_{i,t-1}} \right) \right] \times 100 \quad (3)$$

wherein r and v are the indices' rate of return and rate of variation for trading volume; I and V are the indices' closing price and total trading volume for the day. t refers to the time while i refers to the company's size type. $i = b, m, s$, refers to Taiwan's big size type stocks, medium size stocks, and small size stocks, respectively.

Table 1 shows basic statistics, Jarque-Bera statistics and ADF, and PP unit-root test statistics of the four. The mean of each sample's stock price index's rate of return was negative in the post-financial tsunami period, while the mean of the samples was positive in the pre-financial tsunami period, with the exception of the small type stocks. The standard deviations of the indices in each firm size type were larger in the post-financial than in the pre-financial tsunami. All of the indices skewed to the left regardless of period, and all series were leptokurtic. It was observed from the results of the Jarque-Bera statistics test that the sections related to the rate of return rejected the null hypothesis of normality, signifying that all series data of rate of return do not fit normal distribution. As for the ADF and PP tests, the P values of all series data were smaller than the critical value for a 1% level of significance (-3.44). This signifies that the series data

as the constant null hypothesis cannot be rejected. Thus, the series of the rate of return of all indices' stock price index were stationary.

Table 1: The Basic Statistics and Unit Root Tests of Rate of the Return and Trading Volume Variation Rate for Each Type of Taiwan Stock Market's Stock Price Index

Size	Period	Observed Value	Mean	Standard Deviation	Skewness	Kurtosis	JB	ADF	PP
Large Size Index	Pre-	746	0.0323	1.2111	-0.4654	6.7358	461 **	-	**

	Post-	746	0.0217	23.3489	0.0017	3.7481	17 **	16.9618 *	51.8239 *

This table shows basic statistics of the four indices in the two periods. *, **, *** represent under 10%, 5% and 1% level of significance, respectively. JB is Jarque-Bera test statistics, which signifies rejection of the null hypothesis of normality. ADF and PP are Augmented Dickey-Fuller and Phillips-Perron unit root tests. The threshold values of ADF and PP at .01, .05 and .1 are -3.44, -2.86 and -2.57 respectively.

To analyze the ARCH effect, this paper uses Engle's (1982) Lagrange multiplier (LM) test and observes Ljung-Box's Q statistics. In Table 2 majority of the series LB (12) in this paper are significant, and majority of the LB (12)² and LM tests are significant at 1% level of significance. This means that the series have conditional heteroscedasticity. Using the GARCH model is the optimal choice as the series in this research show conditional variances.

Table 2: Ljung-Box's Q statistics and ARCH Test Effects of The Rate of Returns of Each Type of Stock Price Indices in Taiwan

Firm Size	Period	LB(12)	LB(12) ²	ARCH LM(6)
Large Size Index	Pre-	21.69 *	173.74 ***	73.42 ***

	Post-	100.41 ***	18.56 *	11.91 *

This table shows that majority of the series LB (12) in this paper are significant, and that majority of the LB (12)² and LM tests are significant at 1% level of significance. The ARCH(LM) test is the Chi-square test with 6 degrees of freedom. The GARCH (1,1) model (Brooks, 2002) is used for the testing. After estimation of coefficients, whether or not the autocorrelation effect still exists for standardized residual or the standardized residual's sum of squares is tested in order to confirm the compatibility of the GARCH (1,1) model. For the most suitable lag factor for the mean equation, studies generally use the smallest

model of AIC (Akaike's Information Criterion) value. The AIC values of each type of indices are as shown in Table 3, from which the optimal mean equation for each type of indices can be derived. For example, for Taiwan's big size indices at the post period, the optimal mean equation is:

$$r_t = \alpha_0 + \alpha_1 r_{t-1} + \alpha_2 r_{t-2} + \alpha_3 r_{t-3} + \alpha_4 r_{t-4} + \varepsilon \quad (4)$$

This paper uses the EGARCH (1,1) model developed by Nelson (1991) for analysis, describing the model as follows:

$$R_t | I_{t-1} \sim f(\mu_t, \sigma_t^2) \quad (5)$$

$$R_t = \beta_0 + \sum_{i=1}^p \beta_i R_{t-i} + \varepsilon_t \quad (6)$$

$$n(h_t) = \alpha_0 + \alpha_1 \left(|z_{t-1}| - E[|z_{t-1}|] + \delta \cdot z_{t-1} \right) + \phi \ln(h_{t-1}) \quad (7)$$

Equation (4) represents the distribution of the rate of return (R_t) at t period from expected value to variance as they change through time with the information collected (I_{t-1}) at $t-1$ period. Equation (5) is the mean equation that describes the rate of return's autocorrelation behavior. The variance equation in Equation (6) is the key to the EGARCH model, showing that variances have the autocorrelation of indices, and that residuals can impact future variances. The $z_t \equiv \varepsilon_t/h_t$ in the equation is the value after residuals have undergone conditional variance. The degree of impact of the previous period's standardized residual on the current period's variances can be seen in the coefficient α_1 from Equation (3). If the α_1 is positive, the new information will cause the future volatility to increase. However, because the positive information's z_{t-1} is positive, and the negative information's z_{t-1} is negative, when the coefficient δ is negative, the degree of increase in future volatility brought about by negative information is greater than the increase in future volatility caused by positive information; on the other hand, if the coefficient δ is positive, the degree of increase in the future volatility caused by positive information will be greater than the future volatility caused by negative information. This is asymmetric volatility.

Table 3: Determination of the Most Fitting Lag Factor for the GARCH Model Mean Equation

firm size	period	aic value					
		ar(1)	ar(2)	ar(3)	ar(4)	ar(5)	ar(6)
large size index	pre-	3.2251	3.2228	3.2241	3.2210	3.2583	3.2244
	post-	3.9080	3.8978	3.8981	3.9017	3.9025	3.9049
medium size index	pre-	3.0795	3.0806	3.0737	3.0762	3.0781	3.0780
	post-	3.9864	4.0079	3.9914	3.9950	3.9990	4.0027
small size index	pre-	2.7063	2.7064	2.7035	2.7072	2.7098	2.7123
	post-	3.4187	3.4170	3.4201	3.4233	3.4271	3.4298

This table shows the AIC values of each type of indices, allowing this paper to construct the most optimal mean equation for each type of indices. The smallest values are shown in bold.

EMPIRICAL ANALYSIS

Asymmetric volatility primarily uses the EGARCH model (see results in Table 4). It refers to a situation wherein the increase in volatility caused by positive and negative information is different. The estimation of the EGARCH model is as follows:

$$\ln(\sigma_t^2) = \alpha_0 + \alpha_1 \left(|z_{t-1}| - E[|z_{t-1}|] + \delta z_{t-1} \right) + \phi \ln(\sigma_{t-1}^2) \quad (13)$$

Table 4: Measures of Asymmetric Volatility in the Pre- and Post-financial Tsunami Periods Derived from the EGARCH Model

Indices	Period	AR(p)	α_0	α_1	Δ	Ψ	$1 + \delta $
Large Scale Index	Pre-	4	-0.5812 *** (0.0001)	0.0759 * (0.0590)	-0.0820 ** (0.0470)	0.8374 *** (0.0000)	1.1787
	Post-	2	-0.0691 *** (0.0015)	0.1008 *** (0.0004)	-0.0580 *** (0.0020)	0.9888 *** (0.0000)	1.1232
Medium Scale Index	Pre-	3	-0.1360 *** (0.0085)	0.1739 *** (0.0088)	-0.1888 *** (0.0002)	0.8577 *** (0.0000)	1.4654
	Post-	1	-0.1002 *** (0.0030)	0.2024 *** (0.0001)	-0.1097 *** (0.0001)	0.9391 *** (0.0000)	1.2465
Small Scale Index	Pre-	3	-0.2845 *** (0.0000)	0.3207 *** (0.0000)	-0.0630 (0.1509)	0.8849 *** (0.0000)	1.1346
	Post-	2	-0.1060 ** (0.0233)	0.2039 *** (0.0020)	-0.1201 *** (0.0025)	0.8800 *** (0.0000)	1.2729

This table shows asymmetric volatility of the three indices during the two periods as derived from EGARCH. The figures in parentheses are p values.

This paper assumes a generalized error distribution of a null hypothesis, and uses the large-scale index post-financial tsunami period’s AR(4)-EGARCH(1,1) model to estimate results, as follows:

$$R_t = 0.0223 - 0.0383R_{t-1} - 0.0133R_{t-2} + \varepsilon_t \tag{14}$$

$$\ln(\sigma_t^2) = -0.0691 + 0.1008(|z_{t-1}| - E[|z_{t-1}|]) - 0.0580z_{t-1} + 0.9888\ln(\sigma_{t-1}^2) \tag{15}$$

If during the $t-1$ period a negative information causes ε_{t-1} to be negative, $z_{t-1} = \varepsilon_{t-1} / \sigma_{t-1}^2$ would be a negative value. Thus, every unit’s z_{t-1} will cause the next period’s (t period) $\ln(\sigma_t^2)$ to increase by $0.1008(1+0.0580)$ units, which is 0.1066 units. If the $t-1$ period has positive information, every unit’s z_{t-1} will cause the next period’s $\ln(\sigma_t^2)$ to increase by $0.1008(1-0.0580)$ units, which is 0.0950 units. Thus, the degree of volatility caused by negative information is 1.1231 times greater than the degree of volatility caused by positive information. The coefficient for asymmetric volatility can be measured using $(1+|\delta|) / (1-|\delta|)$ (Koutmos and Saidi (1995)), because when $(1+|\delta|) / (1-|\delta|)$ are biggest, the absolute value of δ would also be very big, so we can use $(1+|\delta|) / (1-|\delta|)$ to study the changes in asymmetric volatility in the post-financial tsunami period. The t test is used to determine whether the asymmetric volatility conditions were similar for pre- and post-financial tsunami periods. The results in Table 5 show that post-financial tsunami, asymmetric volatility decreased significantly except with small-size stocks.

On the effect of different firm sizes on asymmetric volatility, before the financial tsunami (0.0820 · 0.1888 · 0.0630 (insignificant)), the small-size stocks did not show signs of asymmetric volatility. But, after the financial tsunami (0.0580, 0.1097 · 0.1201) the volatility of large-size stocks significantly decreased. Then the Taiwan government implemented a policy prohibiting shorting of large-size stocks which helped with the asymmetric volatility situation. This reaffirms Wei and Yang’s (2011) findings that prohibition of shorting is effective in slowing down the occurrence of asymmetric volatility. On the other hand, shorting has always been prohibited for small-size stocks, which seems to explain why there is no asymmetric volatility with small-size stocks. After the financial tsunami, small-size stocks experienced asymmetric volatility while shorting was prohibited for large-size stocks in order to minimize asymmetric volatility. This helps provide a reasonable explanation on how prohibition of shorting policies can slow down asymmetric volatility.

Table 5: T-tests of the Asymmetric Volatility Indices $|\delta|$ Pre- and Post-Financial Tsunami Periods

Indices	Periods	Obs.	$ \delta $	t-value	
Large Size Indices	Pre-	746	0.0820	-14.4449	***
	Post-	746	0.0580		
Medium Size Indices	Pre-	746	0.1888	-37.0236	***
	Post-	746	0.1097		
Small Size Indices	Pre-	746	0.0630	26.3426	***
	Post-	746	0.1201		

This table shows that the asymmetric volatility decreased significantly except for those with small size stocks. Note that

$$t = \frac{|\delta_{post}| - |\delta_{pre}|}{\sqrt{\frac{\hat{\sigma}_{post}^2}{n_{post}} + \frac{\hat{\sigma}_{pre}^2}{n_{pre}}}}$$

CONCLUSION

This research primarily studies the changes in volatility under different firm size indices, in particular, the asymmetric volatility of uni-variance, during the pre- and post-financial tsunami periods. This results show that not all firm size types show signs of asymmetric volatility during the two periods. After the financial tsunami, the significant decrease in large-size stocks' volatility seems to reflect their higher accessibility of information so their asymmetric volatility was lower than those of medium and small-size stocks. After the financial tsunami, the Taiwanese government implemented a policy prohibiting shorting large-size stocks, which influenced the asymmetric volatility situation, thus reaffirming Wei and Yang's (2011) research that prohibition of shorting can slow down asymmetric volatility. Shorting has always been prohibited for small-size stocks, so this provides a reasonable explanation as to why there was no asymmetric volatility for small-size stocks during the pre-financial tsunami period. Basically, the Taiwan government implemented various policies to lessen the asymmetric volatility situation post-financial tsunami, which may help reduce panic and fear, and it seems to be effective in some way. Results also show that the asymmetric volatility of the Taiwanese stock market during post-financial tsunami slowed down compared to pre-financial tsunami. This could be related to the measures implemented by the government. However, the effects of these measures are beyond the scope of this paper. This could be the foundation for future studies.

EARNINGS MANAGEMENT DURING THE FOURTH QUARTER: AN EMPIRICAL STUDY FOR LISTED COMPANIES IN TAIWAN

Li-Hua Lin, TransWorld University
Szu-Hsien Lin, TransWorld University

ABSTRACT

From both local and foreign literatures in the past, it can be observed that there exists a large discontinuity or kink when the annual earnings distribution of firms is around zero. Theoretically, this can be treated as a result of earnings management, a phenomenon that managers manipulate earnings to avoid earnings decreases or losses (Burgstahler and Dichev, 1997). This paper follows the model of Kerstein and Rai (2007) and proposes two hypotheses: 1. Firms with a small cumulative loss at the end of the third quarter are more likely to manage and convert earnings to a small annual profit; 2. Firms with a small cumulative profit at the end of the third quarter are more likely to manage and prevent earnings from a small annual loss. Our empirical results after using logistic multiple regressions support the above two hypotheses. In other words, managers of listed companies in Taiwan manipulate earnings upward during the fourth quarter to avoid losses or decreases in earnings. Thus, auditors should pay more attention in the future to those firms with cumulative earnings distribution surrounding zero at the end of the third quarter.

KEY WORDS: Earnings Management, Earnings Distribution, Loss, Kink

INTRODUCTION

The earnings of a firm not only concern the firm's survival, but also affect the performance measurement of the managers, and the decision-making of stakeholders to invest or extend credit to the firm. Yet Business Accounting Law stipulates that firms must use accrual basis in accounting, providing managers with discretion in handling financial reports. The strategic exercise of managerial discretion in influencing the earnings figure reported to external audiences is known as earnings management (Schipper, 1989). From both local and foreign literatures in the past, it can be observed that there exists a large discontinuity or kink when the annual earnings distribution of firms around zero. Theoretically, this can be treated as a result of earnings management (Burgstahler and Dichev, 1997). Kerstein and Rai (2007) show that managers could use their discretion during the fourth quarter, causing considerable changes between the cumulative earnings distribution at the end of the third quarter and at the end of the fourth quarter. Due to the fact that there hasn't been a similar study in Taiwan, this paper can fill the void and contribute to international comparison. Besides the introduction in the first section, section 2 reviews past related literatures, and proposes our hypotheses. Section 3 describes the data used and its research methods, while section 4 analyzes its empirical results. Finally, the last section concludes the paper.

REVIEW OF RELATED LITERATURE AND HYPOTHESES

In order to comply with Generally Accepted Accounting Principles (GAAP) and in view of revenue and cost matching principle, accounting information uses accrual basis in keeping accounts. However, there exists a huge room for choice and discretion in accrual basis, providing managers the incentives to engage in earnings management behavior. Past literatures pointed out that the motives for managers to manipulate reported earnings include maximization of bonus plans, company's debt covenants, political costs, capital market motives, loss avoidance, etc. (Healy, 1985; Watts, and Zimmerman, 1978, 1990; Gaver, et al., 1995; Hayn, 1995; Burgstahler and Dichev, 1997). Previous studies indicate that there exists

a large discontinuity or kink when the annual earnings distribution of firms is around zero (such as Hayn, 1995; Burgstahler and Dichev, 1997; Kerstein and Rai, 2007; Lin, et al., 2009; Cui and Wang, 2010; Esteban and Devesa, 2011). This is owing to firms display unusually low frequencies of small decreases in earnings and small losses, and unusually high frequencies of small increases in earnings and small positive income. Theoretically, this can be a result of earnings management; in some situations, managers may manipulate earnings to avoid earnings decreases or losses (Hayn, 1995; Burgstahler and Dichev, 1997). Kerstein and Rai (2007) show that managers could use their discretion during the fourth quarter, causing considerable changes between the cumulative earnings distribution at the end of the third quarter and the annual net income distribution at the end of the fourth quarter. Particularly, for firms with small cumulative losses or profits after three quarters, since their cost in earnings management is the smallest, they are most likely to manage earnings upward to avoid small losses. Although there are a few local literatures which studied the relationship between firms' earnings thresholds and earnings management (such as Young and Wu, 2003; Zhang and Huang, 2005; Cai and Yang, 2006; Lin, et al., 2009), they did not focus on firms that are close to zero profit threshold in cumulative earnings distribution after three quarters and whether or not these firms engaged in earnings management during the fourth quarter.

This paper can supplement this gap. This paper follows the model of Kerstein and Rai (2007) to examine the earnings management during the fourth quarter. Generally speaking, managers would engage in earnings management only when its benefit outweighs its cost. If the benefit of avoiding losses and earning profits is similar for all firms, *ceteris paribus*, it is expected that firms closest to zero earnings threshold with small losses would only need the least amount of upward earnings management to obtain positive profit. Besides, their earnings management is most difficult to find, with the maximum flexibility for earnings management in the future. Hence, these firms are at the core of our observation and are set as the treatment group. If no earnings management occurred, firms with very similar cumulative earnings distribution after three quarters should also have similar pattern in length and direction of fourth-quarter shifts in earnings distribution. Therefore, firms with cumulative earnings distribution after three quarters very close to the treatment group are set as our control group. Based on the aforementioned loss avoidance theory, we expect that firms with the smallest losses in the treatment group would more probably move their annual earnings distribution upwards and achieve the smallest profits than those firms with small losses in the control group. Similarly, we expect the probability of firms with the smallest profits in the treatment group to move downwards and suffer small annual losses is lower than those firms with small profits in the control group. Hence, we propose two hypotheses below:

H1: Firms with small cumulative losses after three quarters would make their effort to shift earnings upward during the fourth quarter and convert cumulative annual net income into small profits.

H2: Firms with small cumulative profits after three quarters would make their effort to shift earnings upward during the fourth quarter and avoid cumulative annual net income becoming small losses.

DATA AND RESEARCH METHODS

Data and Interval Setting

From the Taiwan Stock Exchange Market Observation Post System, this paper selects all the listed companies from 1990 to 2010. After panel data analysis and elimination of firms with incomplete data (including finance-related firms), 8502 firms remain. First, we use market value of equity (MV) at the beginning of the year as the company's scaling variable, and use this variable to standardize the annual net income distributions (NI) and the cumulative earnings distribution of the first three quarters (Y3). Similar to the methods of Burgstahler and Dichev (1997) and Kerstein and Rai (2007), this paper sets the interval width of each scaled Y3 and NI distribution as 0.005. The "smallest profit interval" is set as "+1 interval" while the "smallest loss interval" is set as "-1 interval". These two are the intervals at the right and left of zero annual net income line. As a result, it can be deduced that "+2 interval", "+3 interval", "+4 interval",

and "+5 interval" are intervals that follow on the right side of "+1 interval", while "-2 interval", "-3 interval", "-4 interval", and "-5 interval" are intervals that follow on the left side of "-1 interval".

Research Methods and Variable Setting

Following Kerstein and Rai (2007), to test our hypotheses mentioned in last section, this paper uses two methods to test firms whose Y_3 are surrounding the zero profit line. First, we investigate fourth-quarter shifts near the kink area in NI line. Particularly, we estimate the percentage of these firms moving towards the right (the higher adjacent interval), moving towards the left (the lower adjacent interval), and remaining in the same interval. Second, we use logistic regression to test whether movements of the treatment group firms to the smallest profit interval of NI differs from movements of the control group firms of the same length and direction, *ceteris paribus*.

The logistic regression model and variable setting used by this paper are as follows:

$$UP_{jt} = \beta_0 + \beta_1 \text{Small_loss}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt} \quad (1)$$

$$\text{Stay}_{jt} = \beta_0 + \beta_1 \text{Small_profit}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt} \quad (2)$$

$$\text{Down}_{jt} = \beta_0 + \beta_1 \text{Small_profit}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt} \quad (3)$$

In equations (1)~(3), the variables are set as:

UP_{jt} : =1, if during the fourth quarter of year t, firm j shifts up from the observed interval of Y_3 to the next-higher interval of NI, else =0.

Stay_{jt} : =1, if during the fourth quarter of year t, firm j shifts from the observed interval of Y_3 to the same interval of NI, else =0.

Down_{jt} : =1, if during the fourth quarter of year t, firm j shifts down from the observed interval of Y_3 to the next-lower interval of NI, else =0.

Small_loss_{jt} : =1, if in year t, firm j belongs in "-1 interval" of Y_3 , else =0.

Small_profit_{jt} : =1, if in year t, firm j belongs in "+1 interval" of Y_3 , else =0.

BM_{jt} : book-to-market value ratio of firm j at the beginning of year t = book value / MV_{jt} .

Size_{jt} : Firm size of firm j in year t = $\text{Log}(MV_{jt})$.

IND_{jt} : =1, If in year t firm j belongs to a non-electronics industry, else =0.

YR_{jt} : =1, If the fiscal year is t (t=1990 to 2007), else =0.

Regression equation (1) is used to test H1, while regression equations (2) and (3) are used to test H2. The treatment group is composed of firms closest to zero profit line in Y_3 , which are also the firms we assume to be the highest possibility of earnings management. In regression equation (1), the treatment groups are firms in the -1 interval of Y_3 ; for regression equations (2) and (3), these are firms in the +1 interval of Y_3 . We include size, book-to-market value ratio, type of industry, and year as control variables.

In comparison with the treatment group, we use firms with the -2 interval of Y_3 as the control group in regression equation (1). The control group in regression equations (2) and (3) is composed of firms with the +2 interval of Y_3 . H1 predicts that firms with the smallest losses of Y_3 (in the -1 interval, the treatment group) would arrange for upward movement to the +1 interval during the fourth quarter, so that NI would be converted to small profits. For firms in the -2 interval (the control group), they have incentives to move downward one interval in order to create room for future profits (as bonus plans hypothesis expected), or move upward one interval to report smaller losses. Although the incentives of firms in the -1 interval are similar to those in the -2 interval, the strongest incentive for firms in the -1 interval is to move upward to report small annual profits. Thus, in regression equation (1), the probability of firms that are in the -1 interval of Y_3 to move upward to a higher interval (+1) is higher than those in the -2 interval of Y_3 . The

null hypothesis for H1 is that the probability of these firms is similar. Thus, we expect that the coefficient β_1 of the $Small_loss_{jt}$ variable would be positive.

We have two expectations for H2:

1. If firms with small profits in Y_3 have small losses during the fourth quarter, they will have incentives to manage earnings upward to avoid reporting small annual losses. Otherwise, if firms with small profits in Y_3 have small profits during the fourth quarter, they will have incentives to manage earnings downward to reserve room for future profits (under the guarantee that they will have positive annual profits). Thus, firms in the +1 interval of Y_3 have a considerable high probability to stay in the +1 interval of NI. The null hypothesis of H2 is that the difference between the two is zero. Therefore, H2 hypothesis expects that the coefficient β_1 of $Small_profit_{jt}$ in regression equation (2) is positive.

2. H2 expects that the probability of firms in the +1 interval of Y_3 moving downward to the -1 interval of NI would be lower than the probability of firms in the +2 interval of Y_3 (the control group) moving downward to the +1 interval of NI. For firms that are in the +1 interval of Y_3 would try to avoid losses as much as possible, while firms that are in the +2 interval of Y_3 have a higher probability of manipulate earnings downward, moving one interval down to reserve room for future profits. The null hypothesis of H2 is that the difference of these two is zero. And we expect that the coefficient β_1 of $small_profit_{jt}$ in regression equation (3) is negative.

EMPIRICAL RESULTS

Figure 1 shows that with the scope from -0.2 to +0.2 intervals (with equal distance of 0.005), the number of firms with annual loss (-0.2 to 0) is significantly less than number of firms with positive earnings. Also, there exists a large kink surrounding the zero annual earnings. This is aligned with the observations of foreign and local related literatures (such as Kerstein and Rai, 2007; Burgstahler and Dichev, 1997; Lin et al., 2009; Cui and Wang, 2010; Esteban and Devesa, 2011). Then, we investigate the changes of earnings distribution of the firms in the -5 to +5 intervals during the fourth quarter (sample size equals 1,666 firms). Untabulated results show that in the fourth quarter, the number of firms in the -1 interval (the $smallest_loss$ interval) decreases the most (from 137 to 71 firms, decreasing by 48.18%). This is followed by the decrease in number of firms in the -2 interval (from 152 to 79 firms, decreasing by 48.03%).

The behavior of firms in the +1 interval (the $smallest_profit$ interval) greatly differs from the rest. The number of firms not only does not decrease, but rather increase (from 247 to 249 firms). This explains why there exists a large kink around zero annual net income distribution. We further examine the direction of earnings movement of firms in the -5 to +5 intervals. Untabulated results show that the percentage of firms in the -1 interval that moved upward one interval (to +1 interval) is 13.87%. This is 3.5 times of firms in the -2 interval (3.95%), and is also higher than the percentages of those in the loss intervals (-3 to -5 intervals). This is aligned with the hypothesis of H1.

The percentage of firms with Y_3 in the +1 interval that move down one interval (to -1 interval) is 4.86%, it is significantly lower than those in the +2 interval (16.67%) and those in the other profit intervals (+3 to +5 intervals) that move down one interval. The percentage of firms with Y_3 in the +1 interval and remains in the +1 interval of NI is 24.29%, it is higher than those remain in the +2 interval of NI (12.08%) and those remain in the other profit intervals (+3 to +5). All these are in line with the expectations of H2.

Figure 1 : Scaled Cumulative Annual Earnings Distribution, 1990-2010

This figure shows the number of listed companies of the cumulative annual earnings distribution (scaled by market value of equity at the beginning of the year) around zero profit line from 1990 to 2010.

Table 1 checks out H1 (the control group is composed of firms in the -2 interval of Y_3) and shows the empirical results of logistic regression equation (1) $UP_{jt} = \beta_0 + \beta_1 \text{Small_loss}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt}$. The result shows that the Small_loss regression coefficient (β_1) is 1.520. This means that if the firm's cumulative earnings of Y_3 are in the -1 interval (and not in the -2 interval), the likelihood of the company's annual net income moving one interval upward will increase by (Δ odds) 357% (refer to the explanation at Table 1). As tested with Wald χ^2 , the regression coefficients are significant under 0.5% level of significance. This supports H1's statement that firms with small losses of Y_3 (in the -1 interval) would manipulate earnings up during the fourth quarter to convert to small profits of NI. This result is in line with Kerstein and Rai (2007).

Table 2 checks out H2 (the control group is composed of firms whose Y_3 are in the +2 interval) and shows the empirical results of logistic regression equation (2) $\text{Stay}_{jt} = \beta_0 + \beta_1 \text{small_profit}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt}$. Table 2 shows that the regression coefficient of small_profit variable is 0.706. This means that if firms' cumulative Y_3 distribution belong to the +1 interval (and not +2 interval), then the likelihood of the firms' NI remaining in the same interval will increase by 102.6%. As tested with Wald χ^2 , the regression coefficients are significant at 1% level of significance. This supports H2's statement that firms with small cumulative profits after-three quarters would make their effort to shift earnings upward during the fourth quarter and avoid cumulative annual net income becoming small losses.

Table 1 : Logistic Regression Results of the Smallest Loss Interval of the Cumulative Earnings Distribution after Three Quarters Moving One Interval Up to the Smallest Profit Interval of Annual Net Income

Variable Name	Regression Coefficient		Δ odds(%) ¹	Wald χ^2 ²	P Value
	Symbol	Estimated Value			
Intercept	β_0	4.890		1.22	0.2689
small_loss	β_1	1.520	357.0%	9.27	0.0023
Size	β_2	-0.710		2.74	0.0979
BM	β_3	-1.328		5.31	0.0212

This table shows the empirical results of logistic regression equation (1) $UP_{jt} = \beta_0 + \beta_1 \text{Small_loss}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt}$. We do not list the results of β_4 and β_5 for brief. The treatment group and the control group are separately composed of firms in the -1 and -2 interval of Y3. 1: odds ratio is using regression coefficient to derive antilog (as Excel function $\text{EXP}(\beta_i)$). Since $\beta_1 = 1.52 > 0$, Δ odds = $\text{EXP}(1.52) - 1 = 3.57$. This means that if the cumulative earnings distribution of the firms from the previous three quarters are in the -1 interval (and not in the -2 interval), then the likelihood of the firms' annual net income moving upward one interval (Δ odds) will increase by 357%. 2: Wald χ^2 is a test for singular regression coefficient β_i . Its null hypothesis H_0 is $\beta_i = 0$. Number of firms = 289, McFadden R-squared = 10.30%, Log likelihood ratio test for $\beta = 0$: $\chi^2 = 17.52$ ($p < 0.05$)

Table 3 further tests H2 (control group is comprised of firms whose cumulative earnings distribution after three quarters are in the +2 interval) and shows the results of the logistic regression equation (3) $\text{Down}_{jt} = \beta_0 + \beta_1 \text{Small_profit}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt}$. Table 3 shows that the Small_profit regression coefficient β_1 is -1.550. This means that if the firms' Y3 are in the +1 interval (and not in the +2 interval), then the likelihood of the firms' NI moving downward one interval will decrease by 78.8%. As tested by Wald χ^2 , the regression coefficients are significant at 0.5% level of significance. This further supports hypothesis H2's statement that firms with small cumulative profits after three quarters would make their effort to shift earnings upward during the fourth quarter and avoid cumulative annual net income becoming small annual losses. Summing-up the aforementioned results, Table 1-3 support hypotheses H1 and H2. The kink in annual net income intervals could possibly be due to the fact that many firms with Y3 in the -1 interval unusually move towards the +1 interval of NI, and that many firms with Y3 in the +1 interval unusually remain in the +1 interval of NI (the same interval).

Table 2 : Logistic Regression Results of the Smallest Profit Interval of the Cumulative Earnings Distribution after Three Quarters Remaining in the Same Interval of the Annual Net Income

Variable Name	Regression Coefficient		Δ odds(%) ¹	Wald χ^2 ²	P Value
	Symbol	Estimated Value			
Intercept	β_0	-3.575		2.06	0.1512
small_profit	β_1	0.706	102.6%	7.66	0.0056
size	β_2	0.228		0.91	0.3396
BM	β_3	-0.843		9.35	0.0022

This table shows the empirical results of logistic regression equation (1) $UP_{jt} = \beta_0 + \beta_1 \text{Small_loss}_{jt} + \beta_2 \text{Size}_{jt} + \beta_3 \text{BM}_{jt} + \beta_4 \text{IND}_{jt} + \beta_5 \text{YR}_{jt} + e_{jt}$. We do not list the results of β_4 and β_5 for brief. The treatment group and the control group are separately composed of firms in the -1 and -2 interval of Y3. 1: odds ratio is using regression coefficient to derive antilog (as Excel function $\text{EXP}(\beta_i)$). Since $\beta_1 = 1.52 > 0$, Δ odds = $\text{EXP}(1.52) - 1 = 3.57$. This means that if the cumulative earnings distribution of the firms from the previous three quarters are in the +1 interval (and not in the +2 interval), then the likelihood of the firms' annual net income moving upward one interval (Δ odds) will increase by 357%. 2: Wald χ^2 is a test for singular regression coefficient β_i . Its null hypothesis H_0 is $\beta_i = 0$. Number of firms = 488, McFadden R-squared = 10.96%, Log likelihood ratio test for $\beta = 0$: $\chi^2 = 51.46$ ($p < 0.0001$)

Furthermore, we use sensitivity analysis to examine the logistic regression results when we replace control groups, such as -2 interval replaced by -2~-5 interval, +2 interval replaced by +2~-+5 interval. Although unlisted results show that the regression coefficients slightly change (the Small_loss regression coefficient in regression equation (1) reduces from 1.520 to 0.922; the Small_profit regression coefficient in regression equation (2) increases from 0.706 to 0.908; and the Small_profit regression coefficient in regression equation (3) reduces from -1.551 to -0.972), they all still support hypotheses H1 and H2, and the results are in line with Kerstein and Rai (2007).

Table 3: Logistic Regression Results of the Smallest Profit Interval of the Cumulative Earnings Distribution after Three Quarters Moving Downward One Interval to the Smallest Loss Interval of Annual Net Income

Variable Name	Regression Coefficient		Δ odds(%) ¹	Wald χ^2	P Value
	Symbol	Estimated Value			
Intercept	β_0	-4.138		1.80	0.1795
small_profit	β_1	-1.551	-78.8%	16.87	0
size	β_2	0.291		0.95	0.3304
BM	β_3	-0.152		0.34	0.5594

This table shows the results of the logistic regression equation (3) $Down_{ijt} = \beta_0 + \beta_1 Small_profit_{ijt} + \beta_2 Size_{ijt} + \beta_3 BM_{ijt} + \beta_4 IND_{ijt} + \beta_5 YR_{ijt} + \epsilon_{ijt}$. We do not list the results of β_4 and β_5 for brief. The treatment group and the control group are separately composed of firms in the +1 and +2 interval of Y3. 1: odds ratio is using regression coefficient to derive antilog (as Excel function EXP(β_i)). Since $\beta_1 = -1.55 < 0$, Δ odds = $1 - EXP(-1.55) = 0.788$. This means that if the firms' Y3 are in the +1 interval (and not in the +2 interval), then the likelihood of the firms' NI moving downward one interval will decrease by 78.8%. Number of firms = 488, McFadden R-squared = 7.99%, Log likelihood ratio test for $\beta = 0: \chi^2 = 24.34$ ($p < 0.0002$)

CONCLUSION

This paper follows the model of Kerstein and Rai (2007) and proposes two hypotheses to explain why a large kink exists for the listed companies in Taiwan whose scaled annual earnings are distributed around zero. This paper uses data obtained from the Taiwan Stock Exchange Market Observation Post System from 1990 to 2010. Our empirical results from logistic multiple regressions support the above two hypotheses: 1. Firms with cumulative smallest losses at the end of the third quarter are more likely to manage earnings up to convert losses into smallest annual profit; 2. Firms with cumulative smallest profits at the end of the third quarter are more likely to manage earnings up to avoid becoming small annual losses. This paper shows that in comparison with firms in the control group, there is a significant higher percentage of firms with cumulative smallest loss (-1 interval) after three quarters to move to the smallest annual profit (+1) interval; and there is a significant higher percentage of firms with cumulative smallest profit (+1 interval) after three quarters to remain at the smallest annual profit (+1) interval rather than move downward to the smallest annual loss (-1) interval. This causes the number of firms with the smallest annual loss to be quite low, while the number of firms with the smallest annual profit to be quite high. Thus, there exists a large kink at the scaled annual net income distribution around zero. This is in line with the empirical results of Kerstein and Rai (2007). This paper recommends that in order to safeguard the interests of the investors and to strengthen audit quality, the related executive staff of the Financial Supervisory Commission and accountants should pay more attention to listed firms whose cumulative earnings distribution after three quarters are close to the profit threshold and to prevent them from managing earnings during the fourth quarter.

THE CULTURAL AND CREATIVE POWER OF TELEVISION: HOW CONSUMERS PERCEIVE TV PROGRAM MERCHANDISE

Szu-Yu Chen, Chaoyang University of Technology

ABSTRACT

The cultural and creative industries have been receiving increasing attention worldwide. In Asia, South Korea's achievements in its cultural and creative sector have been greatly noticed, particularly in TV dramas. This study takes a Korean TV drama as the case, intending to examine the effects of TV drama merchandising on consumer attitudes toward the goods. The research focuses on the relationship between consumers' attitudes to the characters and their attitudes to the products. The concept is based on balance theory, in which attitude alignment is the explanation for links between a triad composed of the consumer, the drama character, and the drama merchandise. An online questionnaire survey with viewers of the case TV drama was conducted to investigate the relationship between the variables. Results of the study showed that in general respondents were positive toward the drama paraphernalia, and that individuals who were more positive toward the characters also tended to be more positive toward the merchandise. To conclude, this paper may be of importance in exploring the relationship between attitudes to the characters and attitudes to the paraphernalia, as well as in providing broadcasters, in Taiwan in particular, with a better understanding of the marketing potential of television-based merchandising.

KEYWORDS: attitude theory, television merchandising, cultural and creative industries

INTRODUCTION

Background and Motivation

Over the past few decades, the cultural and creative industries (CCI) have received more attention across the world. In Taiwan, the term *cultural and creative industry* has emerged in the last decade as an issue for which official policies and propaganda have been made and propelled by the Council for Economic Planning and Development as well as the Council for Cultural Affairs (CCA), with the aim of helping industries that possess knowledge economy content to gain standing on the international stage.

The broadcast television industry was the top performer among the cultural and creative industries in 2007, with a turnover of NT\$130.8 billion (New Taiwan Dollars) (CCA, 2009). While being acknowledged as critical to cultural exports, Taiwan's television sector is actually in a predicament, which has partially resulted from over importing foreign programs, among which Korean TV programs have stood out (Liu, 2010; Sun, 2006). Moreover, the popularity of Korean dramas often creates demand for program-related merchandise, generating additional benefits.

Korea did not begin developing its cultural and creative industries (CCI) earlier than Taiwan, but its accomplishments have been discussed worldwide. In particular, the achievements of Korean TV dramas, online games, and entertainment industry have attracted global attention, making the country a window of cultural exports (Chen, 2009). Hence, Korea's successful experience of developing its cultural and creative industries is worth referring to by Taiwan.

Purpose

The objective of this research is therefore to explore Korea's success in the CCI sector, with a focus on the effects of its TV drama merchandising on Taiwanese viewers, in the hope of providing useful information for the television industry in Taiwan. The case Korean TV drama taken in this paper is *Minami Shineyo* (You're Beautiful).

LITERATURE REVIEW

The Cultural and Creative Industry in Taiwan

In order to discover new sources of competitive advantage, Taiwan's industries have to tap into the concept of the knowledge economy, identifying areas of production that lay stress on innovation. The cultural and creative sector has accordingly been regarded as a potential core economic propellant for Taiwan and entitled to government's support (Her, 2011; Hsueh, Lin, & Taylor, 2004).

The Cultural and Creative Industry (CCI) in Taiwan includes visual arts, music and performing arts, cultural property application as well as exhibition and performing arts facilities, crafts, cinema, broadcast and television, publishing, advertising, products design, visual communication design, designer fashion, architecture, digital content, lifestyle, popular music and cultural content, and others (Council for Cultural Affairs [CCA], 2010).

The Television Industry and Merchandising

The broadcast television industry is one of Taiwan's CCI's Flagship Industries (CCA, 2009). While program production is the core value activity of the television sector, merchandising is one of its important ancillary businesses (Council for Economic Planning and Development, 2002). For instance, the vogue of Korean TV series increases not only the popularity of Korean idol stars in Taiwan but also that of paraphernalia, such as fashionable clothes, cuisine, tourism, and numerous websites, related to the programs and characters (Nian, 2001).

A study that researched the relationship between young Taiwanese's watching Korean TV dramas and their purchasing behavior toward drama merchandise has revealed that the extent of viewing Korean TV miniseries is significantly positively correlated to purchase frequency of and expenditure on program paraphernalia (Wang, Chang, & Hong, 2006). The researchers have pointed out that Korean dramas, as a medium, may foster consumers' positive attitudes and purchase intentions toward show-related products.

Balance Theory

The premise of balance theory is that when a person perceives a set of components as linked, the perceiver (A) endeavors to maintain balance in her/his attitude toward another individual (B) and with an object associated with person B (Osgood & Tannenbaum, 1955). The conception underlies the proposal of this paper that if a viewer likes a drama character and a product is positively associated with the character, then the individual will also like the article.

METHODOLOGY

Instrument

An online survey Web site was utilized to program the survey and collect the data. The questionnaire was composed of three parts. Part 1 was a three-item, seven-point attitude toward the show characters measure. Part 2 focused on attitudes regarding the drama merchandise. Finally, demographic information was collected in Part 3.

Participants

The requirements for participation were that the respondent had to be a viewer of the case TV serial, *Minami Shineyo* (You're Beautiful), and an inhabitant of Taiwan. The final sample of the study consisted of 747 complete responses.

RESULTS

The results showed that overall, the respondents were positive toward the drama paraphernalia (grand mean on all three attitude items = 5.53, on 7-point scale, $SD = 1.206$), and toward the drama characters ($M = 6.17$, $SD = 1.028$). Furthermore, a significant positive correlation was found between consumers' attitudes to the characters and their attitudes to the merchandise ($r = .686$, $p < .001$).

CONCLUSION

In sum, the current research is a case study on television merchandising of a Korean TV drama. A major finding is that the effect of TV merchandising on viewers' attitudes toward the products was found. The results indicated that individuals who were more positive toward the characters tended to be more positive toward the program paraphernalia as well. It can be reasoned that a viewer's evaluation of a product associated with a character of a show is affected by the relationship the person has with the character, based on balance theory. As a result, broadcasters in Taiwan are encouraged to make greater use of television merchandising.

Limitations and Future Research

This research provided evidence that attitude toward characters and attitude toward drama paraphernalia are positively correlated. However, more rigorous statistical testing of this relationship could be performed. In addition, given the case study nature of this paper, the results may not be generalized. Thus, a wider array of consumers, programs, and genres should be included in future research.

USING ACTUAL MOTOR CARRIER FREIGHT RATES IN EXCEL SOLVER MODELS FOR LOGISTICS DECISION MAKING

Michael Godfrey, University of Wisconsin Oshkosh

Andrew Manikas, University of Wisconsin Oshkosh

ABSTRACT

In this paper, we analyze a purchase lot-sizing decision that includes transport cost using actual motor carrier freight rates. Lot-sizing models in the literature either estimate motor carrier freight rates with a continuous function or simplify less-than-truckload freight rates unrealistically by using too few weight-break ranges. We present an Excel Solver model that we use in a supply chain management class to teach students the following principles: how to look up less-than-truckload freight rates using a carrier's software, how to calculate less-than-truckload and truckload freight rates, to decide whether to over-declare (artificially inflate) the weight of a less-than-truckload shipment to lower the freight charge, and how to find the purchase lot size that minimizes annual logistics cost. We assume that all-units purchase quantity discounts are offered by the supplier and the product is shipped FOB Origin, Freight Collect. We discuss how to solve this model with Excel's GRG Nonlinear Solver.

KEYWORDS: Excel Solver, linear programming, logistics, purchase lot-sizing

INTRODUCTION

Total annual logistics cost models have been discussed in the literature since 1970. These “inventory theoretic” models add transportation costs to the economic order quantity (EOQ) model, resulting in a model that combines transport, order, holding, and purchase costs. The inventory theoretic model in this paper has been used in an exercise in our supply chain management courses. We have used this model to teach students how to perform the following: (a) to look up less-than-truckload (LTL) freight rates using software from an LTL carrier; (b) to calculate LTL and truckload (TL) freight rates; (c) to decide whether to over-declare the weight of an LTL shipment to lower the total freight charge, and (d) to find the purchase lot size that minimizes annual logistics cost. Annual logistics cost equals the total of annual order cost, annual warehouse holding cost, annual in-transit holding cost, annual transportation cost, and annual purchase cost. In the next section, we review the literature discussing inventory theoretic models. Next, we present the methodology: the data and the Excel spreadsheet and Solver model. Next, we report and discuss the results from this exercise. The last section is the conclusion section.

LITERATURE REVIEW

Baumol and Vinod (1970) introduced the inventory theoretic model. Later, other researchers (e.g., Carter & Ferrin, 1996; Gaither, 1982; Langley, 1980; Larson, 1988; Tyworth, 1991b; Wehrman, 1984) demonstrated adding actual motor carrier freight rates to the purchase lot-sizing decision by using enumeration techniques. Other researchers, e.g., Burwell, Dave, Fitzpatrick, & Roy, 1997; Hwan, Moon, & Shin, 1990; Lee, 1986; Madadi, Kurz, & Ashayeri, 2010; Ramasesh, 1993; Russell & Krajewski, 1991; Tersine & Barman, 1991; Tersine, Larson, & Barman, 1989, created complex algorithms to add actual freight rates into the purchase lot-sizing decision. More recently, Mendoza and Ventura (2008) presented an algorithm based on a grossly simplified freight rate structure (using either a constant charge per truckload (TL) or a constant cost per unit for less-than-truckload (LTL) shipments). Their algorithm also

included two types of purchase quantity discounts (all-units and incremental). He, Hu, and Guo (2010) explained an algorithm for finding the optimal purchase quantity using actual freight rates; however, their model did not incorporate purchase quantity discounts.

The difficulty in solving the inventory theoretic model when using actual motor carrier freight rates is created by the complexity of the LTL freight rates. This complexity is caused by the practice of over-declaring LTL shipments (this issue is discussed later in this paper). Given this complexity, researchers resorted to using enumeration techniques or complex algorithms when using actual freight rates. Alternatively, other researchers decided to model freight rates with continuous functions as described next. Modeling freight rates is estimating freight rates based on the value of some parameter in a continuous function. Examples of these parameters include: (a) the TL charge in an inverse function (Blumenfeld, Burns, Daganzo, Frick, & Hall, 1987; Sheffi, Eskandari, & Koutsopoulos, 1988; Swenseth & Godfrey, 2002; Yildirmaz, Karabati, & Sayin, 2009); (b) distance in a proportional function (Ballou, 1991); (c) the constant used as an exponent in an exponential function (Buffa, 1987, 1988); (d) the smoothing constant in an adjusted inverse function (Swenseth & Buffa, 1990, 1991; Swenseth & Godfrey, 1996; Swenseth & Godfrey, 2002); and (e) load density, shipment weight, and shipment distance in a nonlinear model (Kay & Warsing, 2009).

Ballou (1991) argued that considerations such as time, effort, and cost often dictate that logistics decision-makers should use estimated, rather than actual, freight rates. Mendoza and Ventura (2009) described several limitations when trying to use actual freight rates: time and expense determining exact rates between origin and destination and the issue of the freight rate function not being differentiable. Time, effort, and cost would be expended searching for LTL freight rates for all possible weight-break ranges, determining over-declared weights for each LTL weight-break range, and enumerating all possible lot-size alternatives. In addition, Kay and Warsing (2009) argued that representing the freight rates with an equation makes it easy to determine the optimal purchase lot size, and that shippers would be able to avoid paying for access to LTL tariffs. Using freight rate functions, however, leads to another problem. Tyworth (1991a) and Higginson (1993) criticized existing freight rate functions for not estimating freight rates accurately. Besides, LTL freight rate software can be downloaded at no cost from some LTL carriers. In addition, the minimum cost purchase lot size can be determined with a basic Excel Solver model that uses actual LTL and TL freight rates.

METHODOLOGY

Data

The inventory theoretic model presented here uses the data shown in Table 1 (copied from the Excel spreadsheet). The instructor provides students the data for a single purchased item that is shipped FOB Origin, Freight Collect. We assume the buyer arranges transportation, pays the carrier, and bears the freight charges. In addition, the supplier offers all-units purchase quantity discounts.

Table 1 displays part of the Excel spreadsheet used for entering data. The instructor provides students most of the data except for the less-than-truckload (LTL) freight rates, which the students must find using ABF's Q-Rate for Windows[®] (Q-Rate Download). Students must enter the following data for the problem on the left part of the screen: Holding Cost Rate Warehouse (Cell C7), Holding Cost Rate In-transit (Cell C10), Annual Demand in units (Cell C12), Order Cost (Cell C14), Unit Weight in pounds (Cell C16), Unit Cube in cubic feet (Cell C17), Freight Class (Cell C18), Less-than-Truckload (LTL) Shipping Time Days (Cell C22), Truckload (TL) Shipping Time Days (Cell C23), Maximum TL Weight in pounds (Cell C25), and Maximum TL Cube (Cell C27). The Maximum TL weight is based on a

trailer loaded exactly at the U.S. gross weight limit of 80,000 pounds. Similarly, the TL cube is based on the maximum cubic capacity of a 53-foot trailer. We caution students that companies will create guidelines for limits on weight and cube limits for different products based on their unique product characteristics and transport equipment.

Table 1: Input Screen

	B	C	D	E	F	G
5	Origin Zip Code:	19140		Destination Zip Code:		54901
6	Inputs:				Unit Cost Schedule	
7	Holding Cost Rate	0.65		At Least	Unit Cost	
8	at Warehouse			1		\$195.00
9				300		\$194.90

11	In-transit					
12	Annual Demand	5,000			Nominal Freight Rate Schedule	
13				Range		Rate
14	Order Cost	\$42.00		Minimum LTL Charge		\$367.79
15				1		\$234.46 /CWT
16	Unit Weight	40.00		500		\$196.36 /CWT
17	Unit Cube	4.50		1000		\$164.00 /CWT
18	Freight Class	100		2000		\$145.50 /CWT
19				5000		\$115.89 /CWT
20				10000		\$104.30 /CWT
21	Shipping Time (days)			20000		\$93.87 /CWT
22	(LTL)	3		LTL Discount (%)		60.00%
23	(TL)	2		LTL Fuel Surcharge (%)		30.50%
24						
25	Max.TL Weight	46,100				
26	(Pounds)			TL Fuel Surcharge/Mile		\$0.64 /MILE
27	Max. TL Cube	3,936		TL RATE/MILE (\$)		\$0.97 /MILE
28				MILES		909
29				Min. TL CHARGE		\$600.00

This table shows all of the data that a student must enter for this purchased item, including holding cost rates, order costs, shipment characteristics, shipping times, trailer capacities, purchase costs, and freight charges.

On the right of the screen are data related to purchase costs and transportation costs. The all-units purchase quantity discount schedule is listed in a table array named, "UnitCostLookup" (Cells E8:F11). This array is created as follows: (a) Highlight Cells E8:F11, (b) Select "Formulas" from the Excel toolbar, (c) Select "Define Name" from "Name Manager," enter the name, "UnitCostLookup," and select "OK." This table array can be searched using the "VLOOKUP" function of Excel to find the purchase cost per unit for a given order quantity. The problem considered here has three purchase quantity ranges: 1 – 299 units, 300 – 599 units, and 600+ units. The LTL freight rates (Cells F14:F21) are nominal freight rates (no LTL discount has been applied) and are available on Q-Rate for Windows ®.

The instructions for retrieving LTL freight rates from this software are as follows: (1) Download and install Q-Rate for Windows ®, (2) Enter the origin zip code and the destination zip code, (3) Uncheck "Single shipment charge," (4) Left click on "Tools," (5) Left click on "Rate Inquiry," (6) Print the nominal tariff of LTL freight charges. This tariff lists nominal freight rates for all freight classes (based mainly on product density) and weight-break ranges. Once students have printed the tariff of nominal freight rates, they must find the row for the given freight class (Class 100 was used in this exercise) and the matching freight rates. Then, students must enter those freight rates in Cells F14:F21 under the labels "Range" and "Rate." The Minimum LTL Charge (Cell F14) serves as a floor on the freight charge assessed by the LTL carrier, in this case a flat charge of \$367.79. The next range labeled "1" corresponds to 1 – 499.99 pounds. The freight rate for this range is \$234.46/CWT, where CWT corresponds to century weight (hundreds of pounds). The remaining ranges correspond to 500 – 999.99 pounds, 1,000 – 1,999.99 pounds, 2,000 – 4,999.99 pounds, 5,000 – 9,999.99 pounds, 10,000 – 19,999.99 pounds, and 20,000+ pounds. Directly below the 20,000+ pounds range is the LTL Discount (Cell F22) negotiated between the customer and ABF. The LTL Discount must be applied to the nominal LTL freight rates in Cells F14:F21. The LTL Fuel Surcharge (Cell F23) is a fixed percentage added to the LTL freight charge

to offset the cost of rising diesel prices. The LTL freight charge is: (a) the linehaul rate (based on dividing the shipment weight by 100 and then multiplying by the \$/CWT) plus (b) the LTL Fuel Surcharge (the linehaul rate multiplied by the LTL Fuel Surcharge %).

The LTL rates also must account for the practice of over-declaring a shipment at the next weight-break range. This over-declared weight is based on looking at the next highest LTL weight-break range only. It can be shown algebraically that every LTL weight-break range, except for the last weight-break range of 20,000+ pounds, always will have some weight at which it becomes less expensive to over-declare the shipment at the minimum weight and corresponding freight rate of the next weight-break range. For example, if the shipment weight fell within 500 – 999.99 pounds (rate = \$196.36/CWT), it would be less expensive to label the shipment weight, for example, as follows: 990 pounds as 1,000 pounds @ \$164.00/CWT). LTL carriers will allow the shipment to be artificially increased if doing so saves the customer money. The benefit to the LTL carrier is that customers list true weights on the bill of lading, which allows the LTL carrier to avoid having to weigh every shipment.

TL freight rate data are listed below the LTL freight rate data. The fuel surcharge for the TL carrier must be entered in Cell F26. Notice that TL Fuel Surcharge is stated in \$/mile. The TL Rate/Mile (Cell F27) must be negotiated by the TL carrier and the party paying the freight (the customer in this example). The Miles (Cell F28) were obtained from ABF's software. The Minimum TL Charge (Cell F29) serves as a floor on what the TL carrier will charge. In general, the freight rate per CWT, per pound, and per unit decrease at a decreasing rate as shipment weight increases (economies of weight). The TL freight charge is competitive compared to the LTL freight charges beyond 10,000 pounds (and sometimes even at lower weights). Therefore, we always must check to determine if an LTL shipment should ship with the TL carrier, i.e., over-declared as a TL. Before this problem can be modeled using Excel Solver, some other calculations are necessary to calculate the actual freight rates. Actual freight rates must account for the following: LTL Discount, LTL and TL Fuel Surcharges, the weights over which the Minimum LTL Charge applies, the LTL over-declared weights, and the TL over-declared weights.

Table 2 from the Excel spreadsheet includes most of these: LTL Discount, LTL and TL Fuel Surcharges, weights over which the Minimum LTL Charge applies, and the LTL over-declared weights. The TL over-declared weight is addressed later in this paper. Cell C36 in Table 2 applies the LTL Discount and the LTL Fuel Surcharge to the Minimum LTL Charge as follows: $=(F14*(1-F\$22))*(1+F\$23)$, where Cell F14 corresponds to the nominal Minimum LTL Charge, Cell F22 corresponds to the LTL Discount, and Cell F23 corresponds to the LTL Fuel Surcharge %. For the LTL weight range of 1 – 499.99 pounds (Cell C37), the LTL Discount and the LTL Fuel Surcharge % are applied as follows: $=(F15*(1-F\$22))*(1+F\$23)$. The formulas for all LTL weight ranges are as follows:

Cell C36: $=(F14*(1-F\$22))*(1+F\$23)$
 Cell C37: $=(F15*(1-F\$22))*(1+F\$23)$.
 Cell C38: $=(F16*(1-F\$22))*(1+F\$23)$
 Cell C39: $=(F17*(1-F\$22))*(1+F\$23)$
 Cell C40: $=(F18*(1-F\$22))*(1+F\$23)$
 Cell C41: $=(F19*(1-F\$22))*(1+F\$23)$
 Cell C42: $=(F20*(1-F\$22))*(1+F\$23)$
 Cell C43: $=(F21*(1-F\$22))*(1+F\$23)$

Table 2: Freight Rates after Applying LTL Discount & Surcharges

	B	C	D	E	F
35	Weight (pounds)	Actual Rate*		Weight Breakpoints	
36	Min. LTL Charge	\$191.99		156.87	Weight up to which Min. LTL applies
37	1	\$122.39	per cwt	418.74	Weight at which to over-declare to next LTL range
38	500	\$102.50	per cwt	835.22	Weight at which to over-declare to next LTL range
39	1000	\$85.61	per cwt	1774.33	Weight at which to over-declare to next LTL range
40	2000	\$75.95	per cwt	3982.23	Weight at which to over-declare to next LTL range
41	5000	\$60.49	per cwt	8999.83	Weight at which to over-declare to next LTL range
42	10000	\$54.44	per cwt	18001.47	Weight at which to over-declare to next LTL range
43	20000	\$49.00	per cwt		
44	TL Charge	\$1463.49			

This table applies the LTL discount and the LTL and TL fuel surcharges. In addition, weight breakpoints are determined for which the Minimum LTL charge applies and for the LTL over-declared weights.

The TL Charge (Cell C44) equals the maximum of two charges: the Minimum TL Charge and the applicable TL charge, which is calculated as [(TL Fuel Surcharge/Mile + TL Rate/Mile) * Miles]. The formula in Cell C44 is =MAX(F29,((F26+F27)*F28)). In Cells E36:E42 are the “Weight Breakpoints.” Cell E36 determines the Weight Breakpoint (indifference point) between the Minimum LTL Charge (\$191.99) and the freight rate of \$122.39/CWT for the range of 1 – 499.99 pounds. The weight breakpoint is calculated as $\$191.99 = \$122.39X$. Then, solving for X provides 1.5687 CWT (156.87 CWT * 100 = 156.87 pounds). Therefore, the Minimum LTL Charge applies for weights between 1 – 156.86 pounds. For the range of 1 – 499.99 pounds (\$122.30/CWT), we must first determine the weight at which we will over-declare a shipment as 500 pounds @ \$102.50/CWT. This over-declared weight is calculated as $\$122.39X = 500 * \102.50 , or $\$122.39X = \512.50 . Then, solving for X provides 418.74 pounds. Therefore, the freight rate for 156.87 pounds – 418.73 pounds will equal \$122.39/CWT, and the freight rate for 418.74 pounds – 499.99 pounds will equal a flat charge of \$512.50. The remaining LTL over-declared weights are calculated similarly. The formulas for all the Weight Breakpoints are as follows:

Cell E36: =(C36/C37)*100
 Cell E37: =(B38*C38)/C37
 Cell E38: =(B39*C39)/C38
 Cell E39: =(B40*C40)/C39
 Cell E40: =(B41*C41)/C40
 Cell E41: =(B42*C42)/C41
 Cell E42: =(B43*C43)/C42

Note: Students could confirm all of these Weight Breakpoints using Q-Rate for Windows ®.

Table 3 displays the restructured tariff of all freight rates after building in the over-declared weight ranges. The values in Cells B54:B67 correspond to the beginning of each LTL weight-break range.

Table 3: Actual Freight with Over-Declared Weight Ranges Added

	B	C	D	E	F	G
53	Weight (pounds)	Actual Rate				Formula
54	1	\$191.99	Minimum LTL flat charge			=C54
55	156.87	\$122.39	per cwt			=K\$10/100*C55
56	418.74	\$512.50	flat charge (over-declared to next LTL breakpoint)			=C56
57	500	\$102.50	per cwt			=K\$10/100*C57
58	835.22	\$856.10	flat charge (over-declared to next LTL breakpoint)			=C58
59	1000	\$85.61	per cwt			=K\$10/100*C59
60	1774.33	\$1519.00	flat charge (over-declared to next LTL breakpoint)			=C60
61	2000	\$75.95	per cwt			=K\$10/100*C61
62	3982.23	\$3024.50	flat charge (over-declared to next LTL breakpoint)			=C62
63	5000	\$60.49	per cwt			=K\$10/100*C63
64	8999.83	\$5444.00	flat charge (over-declared to next LTL breakpoint)			=C64
65	10000	\$54.44	per cwt			=K\$10/100*C65

67	20000	\$49.00	per cwt			=K\$10/100*C67
68	TL Charge	\$1463.49	flat charge			=C68

This table shows the weight-break ranges, the actual LTL and TL freight rates, and the formulas for calculating freight rates based on the shipment weight.

Cells C54:C67 contain the relevant freight rates for each LTL weight-break range using the following formulas:

Cell C54: =C36
 Cell C55: =C37
 Cell C56: =B38/100*C38
 Cell C57: =C38
 Cell C58: =B39/100*C39
 Cell C59: =C39
 Cell C60: =B40/100*C40
 Cell C61: =C40
 Cell C62: =B41/100*C41
 Cell C63: =C41
 Cell C64: =B42/100*C42
 Cell C65: =C42
 Cell C66: =B43/100*C43
 Cell C67: =C43
 Cell C68: =C44

Note: Cell C68 contains the TL charge. As shown in Table 3, for the first weight range of 1 – 156.86 pounds, the Minimum LTL Charge (\$191.99) applies. For 156.87 – 418.73 pounds, the LTL freight rate is equal to the Shipment Weight (listed in Cell K10)/100 * \$122.39/CWT. For 418.74 – 499.99 pounds, the LTL freight rate is \$512.50 (the weights in this range are over-declared as 500 pounds @ \$102.50/CWT). For 500 – 835.21 pounds, the LTL freight rate is equal to the Shipment Weight/100 * \$102.50/CWT. For 835.22 – 999.99 pounds, the LTL freight rate is \$856.10 (these weights are over-declared as 1,000 pounds @ \$85.61/CWT). For 1,000 – 1,774.32 pounds, the LTL freight rate is equal to the Shipment Weight/100 * \$85.61/CWT. For 1,774.33 – 1,999.99 pounds, the LTL freight rate is \$1,519.00 (these weights are over-declared as 2,000 pounds @ \$75.95/CWT). For 2,000 – 3,982.22

pounds, the LTL freight rate is equal to the Shipment Weight/100 * \$75.95/CWT. For 3,982.23 – 4,999.99 pounds, the LTL freight rate is \$3,024.50 (these weights are over-declared as 5000 pounds @ \$60.49/CWT). For 5,000 – 8,999.82 pounds, the LTL freight rate is equal to the Shipment Weight/100 * \$60.49/CWT. For 8,999.83 – 9,999.99 pounds, the LTL freight rate is \$5,444.00 (these weights are over-declared as 10,000 pounds @ \$54.44/CWT). For 10,000 – 18,001.46 pounds, the LTL freight rate is equal to the Shipment Weight/100 * \$54.44/CWT. For 18,001.47 – 19,999.99 pounds, the LTL freight rate is \$9800.00 (these weights are over-declared as 20,000 pounds @ \$49.00/CWT). For 20,000+ pounds, the LTL freight rate is equal to the Shipment Weight/100 * \$49.00/CWT. Cells B54:G67 form an Excel table array (LTLFreightRate) that will be used in another part of the spreadsheet to determine the relevant LTL freight charge. The TL Charge is \$1463.49 (shown in Cell G68).

Model

The format of the inventory theoretic model is based on the model described by Swenseth and Godfrey (2002). Annual Logistics Cost = Annual Order Cost + Annual In-Transit Holding Cost + Annual Warehouse Holding Cost + Annual Purchase Cost + Annual Transportation Cost. Annual Logistics Cost (L) is represented as:

$$L = \frac{RS}{Q} + C_v f_i R t + [C_v + C_s] \frac{f_w Q}{2} + RC_v + RC_s \quad (1)$$

R = annual requirements or demand in units; S = cost to place an order; Q = order quantity in units; C_v = unit cost from the vendor (determined from the all-units purchase quantity discount schedule); f_i = in-transit holding cost fraction (rate); t = transit time (fraction of a year); C_s = shipping (transportation) cost per unit; f_w = warehouse holding cost fraction (rate).

These costs are built into the spreadsheet as shown in Table 4 in the Appendix. Table 4 shows the following. Cell J10 is the Order Quantity, which is used as the “Changing Variable” cell in the Excel Solver model. Cell K10 (Shipment Weight) is equal to the Order Quantity * Unit Weight. Cell L10 returns the Relevant LTL Freight Rate based on performing a table lookup (using Shipment Weight) of Cells B54:G67 in the table array, “LTLFreightRate.” Cell M10 is the TL Freight Rate. Cell N10 is the Applicable Freight Rate (the lower of the Relevant LTL Rate and the TL Freight Rate). Cell O10 determines the Freight Rate per Unit. Cell P10 is based on a table lookup (using Order Quantity) of the Unit Costs in the table array, “UnitCostLookup,” in Cells E8:F11. Cell Q10 is used to calculate the Annual Order Cost. Cell R10 is used to calculate the Annual In-Transit Holding Cost (note: the transit time is dependent on whether the LTL or the TL carrier is used). Cell S10 is used to calculate the Annual Transport Cost. Cell T10 is used to calculate the Annual Warehouse Holding Cost. Cell U10 is used to calculate the Annual Purchase Cost. Annual Logistics Cost is calculated in Cell V10, which serves as the “Set Objective” cell in the Solver model (the objective is to minimize Cell V10). Cells K12:K15 are used to create the constraints in the Solver model. The Cube Used (Cell K12) equals Order Quantity * Unit Cube. The Max. TL Cube (3,936) is given in Cell K13. The Weight Used (Cell K14) simply references Shipment Weight. The Max. Weight (Cell K15) is 46,100 pounds. All formulas for this part of the spreadsheet are provided in the Appendix. We now need to add three constraints: $K12 \leq K13$, $K14 \leq K15$, and $J10 = \text{integer}$. Note: Before running the Solver model, it is important to enter any positive value in Cell J10; otherwise, Solver will return an error message. Next, we solve the model in Solver using the GRG Nonlinear Solver.

RESULTS AND DISCUSSIONS

The results for the Excel Solver model are displayed in Table 4 in the Appendix. The Order Quantity that minimizes Annual Logistics Cost is 345 units, with a Shipment Weight of 13,800 pounds and Annual Logistics Cost of \$1,021,041. The TL carrier will be used (note the Applicable Freight Rate corresponds to the TL Freight Rate). The Unit Cost is \$194.90 (345 units falls in the range of 300 – 599.99 units).

At this point, the instructor might want to require students to experiment with different quantities to analyze what happens to each of the annual costs as the Order Quantity increases. For example, the instructor could have students find Annual Logistics Cost for the purchase quantity breakpoints of 300 and 600 units. In addition, students could calculate Annual Logistics Cost at each of the weight breakpoints by converting the weights of 500, 1,000, 2,000, 5,000, 10,000, and 20,000 pounds to their corresponding order quantities by dividing each of these weights by unit weight. Alternatively, the instructor could require students to enumerate all possible order quantities and their respective costs below Table 4.

CONCLUSION

In conclusion, this exercise helps students learn the following concepts: how to look up LTL truckload freight rates using software provided by an LTL carrier (ABF); how to calculate LTL and TL freight rates, including how to apply minimum charges, less-than-truckload discounts, and fuel surcharges; to decide whether to over-declare LTL shipments; and how to modify the basic Economic Order Quantity (EOQ) model to find the purchase lot size that minimizes annual logistics costs

BIOGRAPHY

Dr. Godfrey earned his B.S. in Operations Management and M.S. in Management Information Systems from Northern Illinois University, and his Ph.D. in Production & Operations Management from the University of Nebraska - Lincoln. He is department chair of the Marketing and Supply Chain Management Department at UW Oshkosh. He is a CFPIM, CIRM, and CSCP through APICS and a CPSM through ISM. Email: godfrey@uwosh.edu

Dr. Manikas earned his B.S. in Computer Science and M.B.A. in Materials and Logistics Management from Michigan State University, and his Ph.D. from The Georgia Institute of Technology. Prior to that, he was an instructor for supply chain optimization courses for i2 Technologies and worked as a management consultant for KPMG Peat Marwick, CSC, and Deloitte Consulting. Dr. Manikas is an Assistant Professor in the Marketing and Supply Chain Management Department at UW Oshkosh. Email: manikasa@uwosh.edu

AN EXPLORATORY STUDY OF DECISION-MAKING FOR ONLINE PURCHASE WITHIN A COUPLE

Abdelouahab Mekki Berrada, Université de Sherbrooke

ABSTRACT

Since researchers were interested in the consumer's purchase and navigation behaviors on the Web, the unit of analysis has always been the Net surfer as a single individual interacting with the Website for final decision-making. However, with the growing presence the Internet in households, other situations could be considered. Notably, the possibility of the physical presence of another person, who could actively participate and influence the decision-making process (Zamaria and Fletcher, 2007; Kennedy and Wellman, 2007).

The presence of both members of a couple, during the purchase decision-making process, has been approached for more than 30 years by the researchers in sociology and marketing (Commuri and Gentry, 2000). However, none of this research was in a Web context. Therefore, the main objective of this exploratory research is to better understand the dynamics of the decision-making for online purchases within a couple. In order to accomplish this goal, five couples were invited into our laboratory to make an online purchase. The results of observations and interviews showed that the interaction between two members of couple facing a computer screen can have an impact on decisions and on the accomplishment of tasks on Website.

DOES ORGANIZATIONAL BEHAVIOR MATTER?: CASE STUDY: COMMERCIALIZATION OF TOBACCO PRODUCTS TO MINORS IN DEVELOPING COUNTRIES

Rafael Romero, State University of New York Institute of Technology

ABSTRACT

Tobacco products companies have developed stringent standards for the commercialization of tobacco product to minors. Some of these standards include: checking the I.D. of anyone attempting to purchase tobacco products who appears to be under the age of 27, prohibiting the use of vending machines to sell tobacco products, prohibiting distribution of free tobacco product samples, training employees on the laws that govern the distribution of these products, as well as company policies regarding the sale of tobacco to minors and conducting random compliance checks to ensure employees are following rules and procedures. Despite these efforts, in some developing countries minors still have access to these products. This case presents the efforts tobacco products companies in Venezuela are implementing to reduce or even eliminate the distribution of these products. Results indicate that firms' behavior regarding these types of issues matter. Some of their efforts are effective. But continuous commitment is required.

A CONCEPTUAL MODEL FOR A GREEN SUPPLY CHAIN STRATEGY

Claudia Malcón Cervera, Universidad Popular Autónoma del Estado de Puebla
José Luis Martínez Flores, Universidad Popular Autónoma del Estado de Puebla

ABSTRACT

Nowadays, the negative impact of business activities on the ecosystem (such as global warming and climate disasters) has led to many companies around the world are concerned in implement green practices in their supply chain management, seeking to make their businesses environmental sustainable. However, moving to a green supply chain is not only necessary for sound environmental management, but it is also profitable and provides sound financial management, despite the myth that says it involves additional expenses. In order to show how a green supply chain strategy can be a critical factor for the financial success of a company, in this paper a conceptual model is proposed, based on a literature review and practice in this area.

JEL: L19

KEYWORDS: green practices, strategy, supply chain, critical success factor

INTRODUCTION

Supply chain management is the management of a network of interconnected business involved in the ultimate provision of product and service packages required by end customers and cover all the necessary movement and storage of raw material, work-in-process inventory, and finished goods from the point-of-origin to the point-of-consumption (Cetinkaya et al., 2011). However, during the last years and specifically in 2008, the impact of transporting over the environment is transformed in an important factor in the entire world. The transport sector is responsible for almost 60% of fuel consumption in the countries of the OCDE (Efron, 2009). For this reason, green supply chain management has emerged as an important new approach for enterprises to achieve profit and market share objectives by reducing environmental risk and impact (van Hoek, 1999). With the increased environmental concerns during the past decade, awareness is growing that issues of environmental pollution accompanying industrial development should be addressed together with supply chain management. The fact is that more and more companies begin to integrate goals of environmental protection programs in their corporate and social responsibility. Supply chains of these companies are the key to achieving these goals because the effects can be measured and displayed in a clear and concise way.

In this sense, a green supply chain should be considered as a strategy. This phenomenon implies that companies are now starting to recognize that environmental awareness can be a source of competitive advantage (Walton et al., 1998). Green supply chain management can also promote efficiency and synergy among business partners and their lead corporations, and helps to enhance environmental performance, minimize waste and achieve cost saving (Rao and Holt, 2005). Consequently, the aim of this study is to propose a conceptual model which shows how a green supply chain strategy can be a critical factor for the financial success of a company.

LITERATURE REVIEW

In the state of the art, there are several studies about green initiatives; some of them are related on best practices in green logistics concerned with the environment impact of transportation (Fann and Rakas,

cited en Lou,2011; Thiell et al., cited en Lou, 2011); others recognize the concept of a green supply chain management as selecting suitable suppliers, who are qualified to meet environmental directives or a company's internal green design standards, for enhancing their environmental performance (Chan et al., cited en Lou, 2011; Hu and Hsu, 2010; Efron, 2009). However, only three studies were found related specifically on a strategic plan of a green supply chain. One of them belongs to Cetinkaya et al. (2010), who express that there are three decisive factors which determine the business environment and consequently the strategy of a corporation: demand (customers, target groups); supply (competitors, employees, suppliers) and the general environment (regulations, society, natural resources). They also point out the supply chain, as a key to competitive advantage in many companies, significantly determines the social, economic and environmental impacts of your company, which in turn influence more and more of your stakeholders and shareholders. Hence a sustainable supply chain strategy – representing one of the most important success factors for achieving sustainable development for your company– must exhibit the following characteristics: (1) it is aligned to the underlying corporate and competitive strategy; (2) it considers demand, supply, and in particular order, wider general conditions; (3) it incorporates environmental, social, and economic perspectives in all proposed actions; and (4) it builds increased shareholder and stakeholder value, especially customer satisfaction.

A supply chain strategy exhibiting these characteristics is sustainable and represents the starting point of best practice companies to adapt their enablers for managing internals, managing externals, to adapt their performance measurement system and to adapt their risk management. This research takes into account many important aspects for developing a green supply chain strategy; however, a SWOT analysis is not suggested in order to have an internal and external knowledge of the enterprise as a starting point to generate the strategy. Moreover, Lee et al. (2010) done a research in Taiwan where analyze the external conditions related to the green supply chain management by SWOT method thereby identify the potential opportunities and threats and, meanwhile, assess the internal conditions required by the green supply chain management thereby identify the advantage and disadvantages possessed by the enterprises, and thus create a solid framework for the enterprises with respect to the implementation of green supply chain management. The study recommends concentrating in the most feasible strategy for green supply chain management in relation to the present situations of Taiwan's enterprises. In this research is very important the topic of recommend to do an SWOT analysis; however, it is only the base for a holistic strategy. The third study was developed by Emmet and Sood (2010). They recommend making a roadmap of a green supply chain that include the elements as Green procurement and supply, Green production, Green packaging, Green marketing, Green logistics and Supply loop. Each element has to define their objectives, drivers, parameters, best practices and performance evaluation. They encourage the collaboration between companies, offer some best practices and recommend an approach for migration towards greener supply chains. However, the authors do not consider the company assesses your current state in order to compare your improvement after the implementing the best practices.

Proposed Conceptual Model

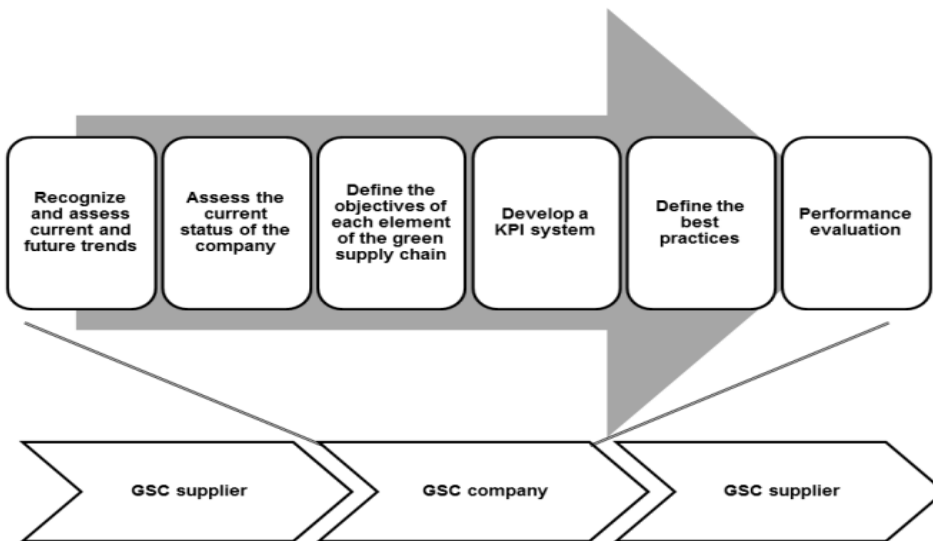

The proposed model in this paper takes several ideas of the authors aforementioned and offers a holistic Green Supply Chain Strategy. It is outlined in figure 1. These steps should be executed in a consecutive way. An explanation of the steps follows:

Recognize And Assess Current And Future Trends

It is very important the company knows about green initiatives, regulations, what benefits and barriers exists, and also the best practices that other companies are implementing. This because the company should understand that greening your supply chain is a necessity nowadays and also because consumers have become more aware of environmental issues.

Assess the current status of the company: In the next step, the company has to assess your current state, including your supply chain. This imply to know the current levels of emissions, natural resources utilization, waste and recycling (environmental dimensions); quality, efficiency and responsiveness (economic dimensions); health and safety, noise and employees (social dimensions). It is also necessary to develop the SWOT analysis that leads to a better understanding of the strengths and weaknesses (internal elements) as well as its opportunities and threats (external elements) that the company has related to a examine the incentive-restrictions mechanism for the green supply chain management.

Figure 1: Green Supply Chain Strategy

This figure shows the proposed model of Green Supply Chain Strategy. Source: authors.

Define the objectives of each element of the green supply chain According to Emmet and Sood (2010), the elements of the green supply chain are:

1. Green procurement and supply. Includes the selection of products and services to minimize the impact on environment.
2. Green production. Involve re-engineering processes to manufacture with low emissions and low cost.
3. Green packaging. Packaging design with optimized thickness and recyclable materials.
4. Green marketing. Create new markets through customer awareness.
5. Green logistics. Optimizing total logistics cost, emissions and on time delivery.
6. Supply loop. Divert End-Of-Life products for reprocessing.

In order to define these objectives the company has to take into consideration environmental, legislation, economic and social dimensions. The challenge here is to establish a realistic balance target in different operations in all dimensions before mentioned.

Develop a KPI system: It is necessary to develop a KPI system (Cetinkaya et al., 2011), which is a kind of quantitative tool (parameters) used to implement strategic goals into company operations. The challenge in this system will be to select the KPIs which measure and control the right operational processes. Environmental and social goals are in most cases new to many operations, and need to be integrated into the existing KPI system of the company. A green strategy is not a strategy for sustainability. True sustainability must give equal weight to the economic dimension. Sustainable green chain practices must be financed and provide pay back within a reasonable time span.

Define the best practices: The next step is to select the best practices or actions to attain each objective. Best practices are those which universally might be considered good, successful or improved approaches within a specific context at a moment in time (Cetinkaya et al., 2011).

Performance evaluation: The last step is to evaluate the performance of the best practices. This will require utilizing the KPI system in order to measure the result of each best practice for then to compare with the objectives defined. In order to migrate towards a Green Supply Chains, it will be necessary to begin with the company for then to involve the different layers of suppliers. This will require an effective strategy of collaboration between all of them.

CONCLUSIONS

A critical success factor is an area, which result has to be satisfactory to ensure the competitive performance of a company (Rockart, 1979). Therefore, develop and implement a green supply chain strategy in companies that operate at regional, national or global level should be considered as a critical factor. It is an important decision that will improve performance due to the fact of companies can enjoy several benefits like positive impact on financial performance, sustainability or resources, lowered costs, product differentiation and competitive advantages, adapting to regulation and reducing risk. The importance of the proposed conceptual model is to provide a holistic strategy as a base for implement the best practices in companies. The authors hope that the model is useful for future research in collecting empirical data to support the model so that the relationship among different variables can be confirmed.

CORPORATE FINANCING AND BUSINESS DEMOGRAPHY IN ITALY

Angela Coscarelli, Department of Economics and Statistics - University of Calabria
Domenica Federico, Department of Business Administration - University of Calabria
Antonella Notte, Department of Business Administration - University of Calabria

ABSTRACT

In the last period, world financial markets were in the midst of a credit crisis of historic breadth and depth that had a special emphasis on the corporate sector. A lot of firms encountered some difficulties to survive and to adopt correct strategies. Firstly, this research shows a picture of Italian industrial and service firms in the period 2007-2010, highlighting the principal economic characteristics and focusing the attention on the corporate financing. Secondly, it studies the business demography and describes the survival of the Italian corporate system. The research deals with a collection and elaboration of data published by the Bank of Italy concerning a survey on Italian Industrial and Service Firms in 2010 and the elaboration of data published by Infocamere in the period 1995-2009. The study uses a multi-disciplinary approach and it is realized through applied demography techniques to analyze the Italian firms growth.

JEL: G01, G30, J11

KEYWORDS: Italian firms, corporate financing, business demography

INTRODUCTION

During the last period, Italian firms are seriously affected by the financial crisis of 2007. The different types of businesses have felt the effects of the crisis, particularly their survival has been questioned. Excessive mortality due to financial strangulation of too many companies that have the potential to prosper after the crisis is a serious risk for the Italian economy. This research studies Italian firms from two points of view. Firstly, it shows a picture of Italian industrial and service firms, highlighting the principal economic characteristics (labor, capital and output, ownership, organization and governance) and focusing the attention on some aspects of the corporate financing (bank debt). Secondly, it examines the growth of Italian firms using the business demography that allows studying the quantitative change undergone by the Italian industry over the last fifteen years; this approach acquires a leading role for the evaluation of services and it results a crucial tool for supporting political decisions. Data are published by the Bank of Italy and concern a survey on Italian Industrial and Service Firms in 2010. The sample consists of 2,809 industrial firms, 504 construction companies and 1,128 non-financial private service firms. Data are collected by Infocamere and present the demographic structure of firms from 1995 to 2010. In this way, it is possible to have a complete vision of Italian firms demography and of their survival.

LITERATURE REVIEW

The first part of the research focuses on the period 2007-2010, which is characterized by a deep financial crisis. This crisis is of such proportions that even important initiatives to face the problem have so far been insufficient to resolve it. An analysis of phases and causes of this “colossal failure” that has put “the entire financial system at risk” (Woellert and Kopecki, 2008) is fundamental to understand the current situation of Italian firms and their survival.

The financial crisis was originated in the segment of subprime mortgage and structured products (Greenlaw et al., 2008). At the end of 2006, growth in house prices in United States (US) stopped abruptly reflecting the rise in official interest rates and the slowing economy. At the beginning of 2007, subprime mortgages have started to show high rates of default following the increase in debt service (Chomsisengphet and Pennington-Cross, 2006; Doms et al., 2007). This recent financial crisis represented the worst since the Great Depression of the 1930s (Sinn, 2009). The crisis contributed to the failure of many companies, led to a substantial decline in consumer wealth, produced enormous financial commitments incurred by governments, and resulted in a strong decline in economic activity. It became visible to everyone with the bankruptcy of Lehman Brothers and the near-bankruptcy of American International Group in September 2008. Following these events, many other financial institutions in the US and around the world have lost large portions of their value and some of them could only be saved from bankruptcy by government interventions.

Many causes of the crisis have recently been proposed. According to some authors, a fundamental cause for this failure regards the often inadequate model of risk management (Rajun et al., 2008). We focus on some prominent explanations: the US housing bubble, the subprime crisis, the deregulation of financial markets in recent decades and the consequent creation of many complex financial innovations. Firstly, the years prior to the outbreak of the crisis were characterized by a strong increase in US housing prices. This housing bubble was related to increasing financial incentives for banks to engage in mortgage loans. The decrease in the federal funds rate from the year 2000 onwards coincided with larger profit margins for banks on mortgages. As a result, housing prices peaked in 2006; their value had roughly doubled over the preceding decade. This boom period in the housing market was most importantly characterized by a strong increase in the amount of subprime mortgages. Secondly, between 2004 and 2007, the federal funds rate started to steadily increase again. This trend brought increasing expenses for borrowers holding adjustable-rate mortgages. The combination of an increasing federal funds rate with the growing share of subprime mortgages led to a severe increase in the number of homeowners defaulting on mortgage payments as well an increase in the number of foreclosures on properties.

Increasing insecurity with regard to the credibility of institutions has made banks more reluctant to lend, leading to a tightening of their lending requirements. Finally, government regulations did not prevent banks from providing larger shares of subprime mortgages. In 2004, the loosening of the net capital rule made banks able to take on larger proportions of debt. The increasing share of subprime mortgages was pooled into new financial products, selling them off to investors as CDOs (collateralized debt obligation) and MBS (mortgage-backed securities) (Bolton and Freixas, 2000; Mayer and Pence, 2008). The relatively safe credit ratings of these products contributed to an increasing demand of investors for mortgage-based derivatives. According to the latest forecasts by Bank of Italy, in 2010, the Italian economy returned to modest growth of 1.3%, close to the average for the ten years before the recession, prolonging the country's lag with respect to the euro area as a whole. From the start of the cyclical recovery in the summer of 2009, Gross Domestic Product (GDP) has recouped just 2 of the 7 percentage points lost during the financial crisis. (Bank of Italy, 2011_a). The slow growth of the Italian economy in 2010 was ascribable to both industry and services, particularly services provided by general government, which were subject to tight budget constraints. Data now indicate that the recovery will continue at a slow pace in the coming months. The recovery in GDP in 2010 was sustained by the growth in value added in industry excluding construction (4.8%) and, more moderately, in services (1.0%).

In manufacturing, the largest increase in value added was recorded in base metals and fabricated metal products, mechanical engineering products and electrical and electronic machinery. In the traditional sectors (textiles and clothing, hides and leather, furniture) value added recovered only a very small part of the decline recorded during the recession. The growth in value added in the service sector was modest, partly owing to the stagnation in general government activity, including healthcare and education. These sectors, which were affected by budget restrictions, accounted for more than half the gap with respect to

the growth of Germany's service sector (1.8% and 3.5%, respectively, since the start of the recovery). There is a gap with respect to growth rates of the other main euro-area countries that reflects the slowdown in industry under way since the last months of 2010.

DATA AND METHODOLOGY

Data concern the principal economic, financial and demographic characteristics of Italian firms in 2010, and are published by the Bank of Italy and Infocamere. In the first part, the research contains the main findings of the Bank of Italy Survey of Industrial and Service Firms conducted in the early months of 2011 (Bank of Italy, 2011_b). Particularly, our sample is composed by only Italian industrial and service firms and, from the structural point of view, it consists of 2,809 non-construction industrial firms, 1,128 non-financial private service firms and 504 construction companies (Figure 1).

Figure 1: Sample of firms (values in percent)

This figure shows the percentage distribution of sample of firms: the non-construction industrial firms representing the 63%, the non-financial private service firms the 25% and the construction companies the 12%.

In the second part, the study focuses on the demographic performance of Italian firms by activity sector from 1995 to 2010. Particularly, the following activity sectors are observed: agriculture; manufacturing; construction; commerce; tourism; financial intermediation and real estate, renting and research. From the methodological point of view, the research uses a multi-disciplinary approach and is developed through a demographic investigation regarding the Italian industrial trend in the period 1995-2010. Firstly this study shows a picture of Italian industrial and service firms, highlighting the principal differences in economic and financial characteristics as labor, capital and output, ownership, organization and governance, corporate financing. Secondly it observes the impact of the financial crisis on the Italian corporate system with regards to the total firms using birth and mortality rates of firms so that to investigate by a demographic approach the firms structure during the period examined.

$$\text{Birth Rate} = \frac{Firms(t)_{birth}}{Firms(t)_{activated}} * 1000; \quad \text{Mortality rate} = \frac{Firms(t)_{closed}}{Firms(t)_{activated}} * 1000$$

where (t) is the considered period.

A Picture of Italian Industrial and Service Firms

The characteristics of industrial and service firms regards the following aspects: employment, turnover and operating results, investment and capacity utilization, ownership, organization and governance, aspects of corporate financing. According to the Bank of Italy survey, in 2010, average employment continued to fall and declined by 1.4%, although this was slower than in the previous year, when it fell by 1.9%. The largest fall occurred in industry and amounted to 2.2% (only in 2007 there was a growing),

while the fall in services was 0.6% (in the period 2007-2008 there was a growing). Furthermore the contraction in employment was especially pronounced in the textile, clothing and footwear sector (-1.0% in 2007 and -3.3% in 2010), where it had begun before the crisis. In 2010, this contraction was sizable in the basic metals and engineering sector (-2.6%). In geographical terms in the period 2007-2010, the contraction employment in industry occurred in the North-West (Table 1).

Table 1: Change in average workforce (values in percent)

Area of employment	Industrial firms				Service firms

200 – 499	0.9	0.3	-2.4	-2.5	3.7	3.8	0.7	-1.0
500 and over	0.5	-0.3	-2.5	-2.4	2.9	1.3	0.0	0.1
Total	0.3	-0.7	-2.5	-2.2	2.3	0.9	-1.2	-0.6

This table shows the change in average workforce in industrial and service Italian firms. Particularly, data are distinct in area of employment, branch of activity and number of employees in the period 2007-2010.

In 2010, the turnover of private-sector firms rose by 1.1% at constant prices, recovering only a small part of the large fall of 7.5% recorded in 2009. The increase was the result of a 3.5% rise in industry and of a -1.1% fall in services. In industry better-than-average improvements were recorded by firms in the North (4.9%), firms in the basic metals and engineering sector (7.6%). In the service sector sales contracted in all the macro regions and size classes of firms, except for those with between 200 and 499 workers, while at the sectoral level there was a small increase in sales of 2.2% by firms providing services to enterprises and households (Table 2).

The proportion of firms posting a profit rose from 53% in 2009 to 57.8% in 2010. The improvement was greatest for industrial firms (for which the proportion rose from 52% to 60% overall), especially the larger ones. In services the fall in the proportion of loss-making firms to 27.4% was accompanied by an increase of just one percentage point to 55.3% in the proportion of those making a profit. In general, the results are worse compared with the crisis period 2007-2008.

Gross fixed investment rose by 3.5% compared with 2009, thus making good about a quarter of the fall recorded in that year. The result derived from the modest improvement of 0.7% in industry (5.6% in 2007) and the growth of 6.8% (-0.1 in 2007) recorded by the service sector. Particularly, investment by industrial firms with less than 50 workers recorded a strong recovery of 11.8% (6.0% in 2007), while that by firms with 500 or more workers declined further, by 4.7%. The investment grew by 3% in the North (more than 4% in the North-East), as against contractions of 3% in the Centre and the South and Islands. The largest sectoral increase in investment (18.6%) was recorded by the textile, clothing and leather sector, which had suffered a contraction of 40% in the two previous years taken together. The chemical, rubber and plastic industries saw a smaller increase of 6%, while investment by firms in the basic metals and engineering sector declined further, by nearly 5%, after falling by 23% in 2009. In service firms the

recovery in investment was basically common to every type of firm but was strongest for firms with their head office in the North-West or the Centre and those with 50 or more workers. Transport and telecommunications was the service sector with the largest increase in investment (9.4%), while the other service sectors achieved only a modest recovery (Table 3).

This table shows the change in investment in industrial and service Italian firms. Particularly, data are distinct in geographical area, branch of activity and number of employees in the period 2007-2010.

Regarding the concentration of ownership, stock exchange listing, and controlling shareholders, the survey collects information of industrial firms with 50 employees and over. In industrial firms with 50 or more workers about 70% of the capital was owned by the main shareholder on average. In about 55% of such firms the shares were held by a company (a holding or a sub-holding company or a nonfinancial corporation). Industrial firms continued to have only very limited recourse to the capital markets: no more

than 1.7% of such firms are listed on the stock exchange and most of these are of above-average size. In line with the previous year, transfers of control involved about 4% of industrial firms with 50 or more workers in 2010. Nearly 70% of the transfers consisted of shifts in shareholdings between companies belonging to the same group or between relations. Finally, the research provides a more detailed analysis on some aspects of firms fund-raising exclusively for firms with 50 or more workers.

More firms reported a rise in self-financing than a fall (in industry respectively 63.5% and 28.1% of the total; in service sector respectively 61.7% and 30.4% of the total), thus halting the adverse trend of the previous years. The recovery in corporate profitability was not sufficient to meet firms increased financing needs in relation to the increases in investment and production. Consequently, the rise in self-financing was accompanied by increased recourse to equity capital and bank loans both in industrial and service firms (Table 4).

Table 4: Changes in sources of finance in firms with 50+ employees in 2010 (values in percent)

20 – 49	-	-	-	-	-	-	-	-
50 – 199	32.5	58.7	5.5	9.4	2.6	1.9	16.3	22.0
200 – 499	19.4	76.6	4.1	16.1	1.1	0.9	24.7	34.0
500 and over	29.4	66.2	6.9	19.1	4.2	4.5	20.2	27.7
Total	29.2	62.6	4.7	11.7	2.4	1.9	19.6	27.3

This table shows the change in sources of finance in industrial and service firms with 50 employees and over in 2010. Particularly, data are distinct in geographical area, branch of activity and number of employees and in different source of finance (self-financing, equity capital, bonds and other longterm securities, bank loans).

The demand for loans for debt restructuring purposes slowed significantly. Some 9.6% of firms declared they had entered into negotiations to restructure their bank loans. The reduction was especially marked for services and varied across industry. More specifically, there was a large fall among firms in the Centre (10 percentage points) and the South and Islands (6.4 percentage points) while the fall among firms in the North-West was less pronounced (3.7 percentage points) and firms in the North-East recorded an increase (2.6 percentage points). Some 4.2% of firms declared they had reached an agreement with their lenders (down by more than 4 percentage points on 2009), while another 3.9% were on the verge of concluding such an agreement; only 1.5% of firms failed to reach an agreement. Moreover, 5.9% of firms declared they had adhered to the “debt moratorium”.

To measure firms effective need for credit, a series of questions on the firms willingness to incur additional costs to obtain more financing and the action to obtain it are proposed. In 2010 some 29.6% of firms would have liked to increase their borrowing from banks and other financial intermediaries at the cost and security conditions currently applied. The proportion was slightly higher for industrial firms (31.3%) than for non-financial private service firms (27.7%) and in the South and Islands (35.6%) than in the Centre (31.3%) and the North (27.3%) (Table 5).

Table 5: Percentage of firms that want increase their indebtedness in 2010

	<i>Total</i>	Would have accepted worse conditions to obtain financing (1)	Actually applied for new loans (2)	Both the foregoing (1) and (2)	Applications for new loans turned down in whole or in part	Did not apply to banks because they believed they would be turned down
Geographical area						
Centre North	28.3	10.4	26.3	9.6	5.9	0.9
South and Islands	35.6	13.8	32.1	12.9	10.4	2.5
Branch of activity						
Industry	29.6	10.4	27.4	9.6	6.4	1.0
Services	29.6	12.3	27.3	11.4	7.5	1.7
Number of employees						
20 – 49	31.3	11.6	28.9	10.8	7.0	1.5
50 and over	27.7	10.4	25.7	9.6	6.4	0.9
Total	29.6	11.0	27.4	10.2	6.7	1.2

This table shows the percentage of firms that want increase their indebtedness in 2010, distinct in geographical area, branch of activity and number of employees. Data regards some questions on the firms willingness to incur additional costs to obtain more financing and the action to obtain it.

In industry, sectors that showed the greatest desire to increase their borrowing were energy and extractive firms (34.5%) and in services they were transport and communications firms (33.1%). Only 11% of firms wished to increase their borrowing and would have accepted tighter lending or security conditions. Nearly all the firms that wished to increase their borrowing (27.4% of all firms) actually applied for new financing in 2010; another 1.2% did not apply mainly because they believed intermediaries would have turned down their requests. Some 6.7% of firms declared that their applications for financing were turned down in whole or in part. Between 2009 and 2010 there was a small decrease in the proportion of industrial firms reporting a tightening of borrowing conditions and a small increase in the proportion of service firms. The most severe assessments of the change in borrowing conditions concerned the level of accessory costs and, to a lesser extent, interest rates and the complexity of the corporate information to be provided to obtain new loans. Some 4.1% of firms had loans called in early by their lenders in 2010 (Table 6).

Table 6: Borrowing conditions and loans called in (per cent of firms)

	2009	2010
	Tightening of borrowing conditions	
Industry	22.4	19.3
Services	16.7	18.7
Total	19.8	19.0
	Loans called in	
Industry	9.0	4.1
Services	6.1	4.1
Total	7.7	4.1

This table shows the percentage of borrowing conditions and loans called in, distinct in tightening of borrowing conditions and loans called in, in the period 2009-2010.

THE BUSINESS DEMOGRAPHY

The business demography is used to analyze the dynamics of the market and the various regional economic environments. The creation of new businesses and their exit from the market are important indicators of the degree of dynamism of an economic system and persistence of new initiatives in the markets to competition (Vivarelli, 2000).

The impact of the financial crisis on the Italian corporate system has been studied considering the demographic trend of Italian firms from 1995 to 2010. Generally, the first observation puts in evidence that the Italian corporate system has undergone important changes. The birth rate and the mortality rate have been compute to describe the demographic trend of Italian firms in the examined period. Figure 2 shows the demographic transition of Italian firms from 1995 to 2010. Particularly it presents the birth and mortality rates of the firms recorded in the same period. The demographic analysis, generally, describes a constant trend, even if it observes a strong input of birth in 1997. This data is influenced by the strong growth of the agriculture sector activity, in fact its birth rate increases from 73‰ in 1995 to 848‰ in 1997. In 2009 the mortality rate is higher than birth, but during the next year (2010) of the analysis it is possible to observe a slight growth.

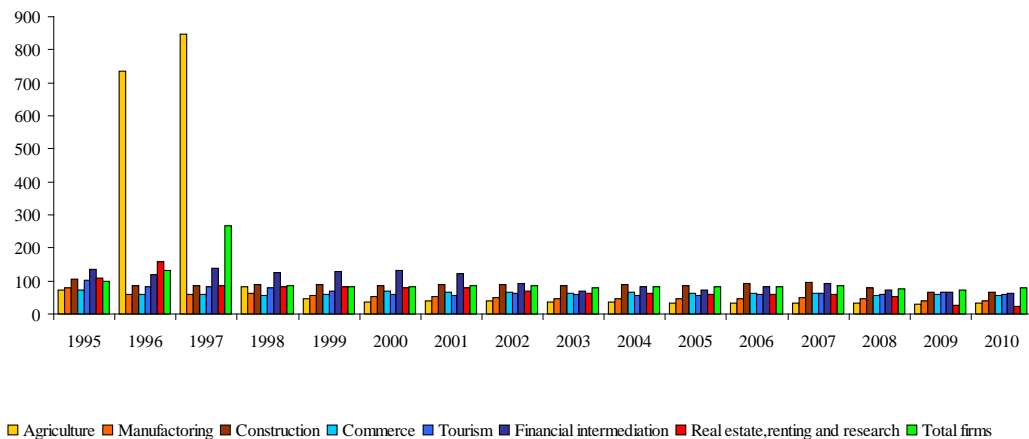

Figure 2: Demographic transition of Italian firms (values per thousand)

This figure shows the demographic transition of Italian firms in the period 1995-2010. Particularly data on birth date and mortality rate are put in evidence.

The birth of the firms decreases for all examined period and the sector activity with the largest decrease is the real estate, renting and research following by the financial intermediation, respectively from 108‰ (1995) to 24‰ (2010) and from 136‰ (1995) to 63‰ (2010). However, it is evident the strong growth of the agriculture firms above all in 1996 and 1997 (Figure 3).

Figure 3: Birth rate trend by activity sector (values per thousand)

This figure shows the different trends of the birth rate by activity sector in the period 1995-2010.

The data previously described are confirmed by the mortality rate trend. Figure 4 notes how the agriculture sector lives a good period in 1996-1997, and real estate, renting and research together to the financial intermediation present the high mortality of the firms.

Figure 4: Mortality rate trend by activity sector (values per thousand)

This figure shows the mortality rate trend by activity sector in the period 1995-2010.

Besides, the study has developed the net rate of turnover namely the difference by the two demographic rates discussed in the precedent section. This indicator explains the increase undergone by Italian firms and it confirms the bad birth trend (Figure 5). By this indicator it observes the growth of the number of Italian firms. The net rate of turnover presents high values for the first part of the period examined, this positivity is due to the increase of the agriculture sector. During the last years considered, its values

become negative, sign of decrease of the firms, but in 2010 it observes a slight growth due to the positive data of the birth rate.

Figure 5: Net rate of turnover (values per thousand)

This figure shows the net rate of turnover in the period 1995-2010.

The business demography in Italian regions at 2010 shows values of the birth and mortality rates different: for both indicators, the highest values are recorded in the South of Italy, while lower ones are related to the Northeast (Figure 6). In the South of Italy, it records the highest net rate of turnover, confirming data 2001, with particularly high values in Puglia, Abruzzo and Campania. Lombardy and Veneto is around 0.7%, while in Emilia-Romagna net rate of turnover amounted to 0.56%. Among the regions of Centre of Italy, the Marche present a gross rate of turnover much lower than the average of own geographical distribution, but it is associated a net rate of turnover high.

Figure 6: Net rate of turnover of the Italian regions in 2010 (values in percent)

This figure shows the net rate of turnover through a photography of the different Italian region in 2010. Data are distinct from more light colors to identify low net rate of turnover to more strong colors to identify low net rate of turnover.

CONCLUSIONS

The picture of Italian industrial and service firms, in the period 2007-2010, shows some aspects, as employment, turnover and operating results, investment and capacity utilization, ownership, organization and governance and corporate financing. Particularly, in 2010 employment fell by 1.4% compared with 2009; the largest contraction occurred in industry (2.2%), while the fall in services was 0.6%. Turnover rose by 1.1% at constant prices, thanks to the increase of 3.5% recorded by industry, while services recorded a further fall of 1.1%. Furthermore, the research puts in evidence as the majority of firms reported an increase in their self-financing (the first time for two years). Besides, the rise in self-financing was accompanied by increased recourse to equity capital and bank loans. With regard to bank loans, nearly all the firms that wished to increase their borrowing actually applied for new financing in 2010; few firms did not apply mainly because they believed intermediaries would have turned down their requests.

SMALL-SCALE MINING IN ZIMBABWE: HISTORICAL PERSPECTIVE

Trust Tendai Masiya, University of Zimbabwe

Lyman Mlambo, University of Zimbabwe

Motive Mungoni, University of Zimbabwe

ABSTRACT

The current discourse on small-scale mining in Zimbabwe has predominantly been a characterization of the current state of the sector. This paper focuses on the evolution of the sector through three historical epochs, namely the pre-colonial period (before 1890), colonial period (1890 to 1979) and the post-colonial period (after 1980). The development of the sector is looked at in terms of economic significance, mining methods, processing techniques, government support and legislation. The sector has remained of great economic importance since the pre-colonial times, especially in terms of its contribution to national output, employment, and poverty alleviation. From the efforts of pre-colonial small-scale miners several of the larger mines have developed. However, its contribution to regional development has been limited. The paper generally concludes that today's small-scale miners, albeit with minor technological improvements, are still using the same methods that were employed by pre-colonial and colonial miners. They still face the same challenges of poor working conditions, lack of capital and lack of technical know-how, and are still associated with serious environmental problems. Most of these constraints and problems are intimately related to their small-scale nature and lack of pertinent legal framework and government support.

KEYWORDS: small-scale mining, mineral prospecting, gold panning

INTRODUCTION

The historical development of small scale mining in Zimbabwe dates back to the period well before colonization in the 1890s (Maponga and Ngorima, 2003). The sector is an important part of the Zimbabwean mineral production system and it has played a pivotal role in the economic development of the country since pre-colonial times. Small-scale mining in Zimbabwe is composed of the formal small-scale subsector in which more than 20,000 claims are registered in accordance with the provisions of the Mines and Minerals Act, and the informal small-scale and artisanal operators, numbering in excess of 350,000, who are primarily unregistered panners and diggers. The definition of what constitutes small-scale or artisanal mining has never been clear-cut (Dreschler, 2001). Definitions have tended to be country, stakeholder and purpose specific - that is, the distinction has really been in the *eye of the beholder*. Generally, definitions have been based on one or all of the following criteria: production output, turnover, degree of mechanization, labour, size of mining concession or lease and size of reserve, operational continuity, *et cetera*. According to Maponga (2003), the definition of small-scale mining as applied in Zimbabwe includes both formal and informal operators, mechanised and semi-mechanised miners of varying sizes in terms of production, labour and capitalization.

While a lot has been written on the artisanal and small-scale mining sector in Zimbabwe, most of it is based either on the current status of the sector or on the ancient mining period. Miller *et al* (2000) and Hammel *et al* (2000) deal only with pre-colonial mining, Phimister (1975) with the pre-colonial and colonial era. This study suggests that an integrated overview of pre-colonial, colonial and post-colonial mining is more enlightening in a number of ways. This paper is, therefore, an attempt to analyze the development of the small-scale mining sector from a diagnostic historical perspective. The significance of the study is that:

1. an appreciation of the evolution of the sector will enhance understanding of the root causes of the current problems of the sector, which is a different approach from the current discourse whereby symptoms (the current problems) are treated as root causes and are almost always addressed directly; and
2. the study represents an opportunity, like any history lesson, to learn how challenges met in the past were addressed; and

This paper is, therefore, a rapid appraisal of the evolution and development of the sector in terms of: (a) mining methods and equipment, (b) processing techniques, (c) economic significance and, (d) government support and legislation relevant to the sector. These elements are discussed in the context of three historical epochs, namely the pre-colonial period (period before 1890), the colonial period (1890 to 1979) and the post-colonial period (1980 to date). While current small-scale mining is involved with a number of minerals such as chromite, emeralds, industrial minerals, tantalite and tin, this paper is biased towards gold production since it is the mineral which has been most widely exploited by the sector.

MINING METHODS/PRACTICES

Pre-Colonial Period

In pre-colonial era the mining methods employed were based on two distinguishable techniques: open stopes, which were horizontal and inclined excavations, and the vertical shafts with underground stopes. The open stopes were deep trenches which followed more or less vertical ore bodies with dips exceeding 70°, going as far down as the water table and ventilation would permit, or until the ore was exhausted (Summers, 1966). It was by far the most used method (Anderson, 1961). The individual stopes were open and sometimes narrow trenches which could stretch as long as 610 metres. The use of shafts was mainly for relatively horizontal ore bodies and for cases where the ore body outcropped on the side of a hill (Summers, 1966). It was mainly limited to north-eastern Zimbabwe where reefs tended to be flatter than elsewhere in the country. The shaft technique involved sinking a shaft of about 1 metre in diameter or diameters as small as 0.45 metres, until the reef was reached (Hammel *et al*, 2000).

The shafts were rarely connected by drives and stopes, and it would appear that where they intersected the reef, the latter was exploited in all directions for a few metres, that is, *belled out* slightly, and this was all that was done. Another shaft was then sunk nearby and the process would be repeated. Shafts rarely exceeded 6 to 25 metres although cases are known where more than 30 metres have been reached. No artificial light was needed for shaft mining as natural light was sufficient since most stopes were not deeper than 30 metres. For breaking up the ore containing rocks, especially the hard rock, the miners had to rely on alternately heating and cooling the rock by a process known as fire-setting, as the use of explosives in mining was unknown until 1890 following the British occupation. It was by far the safest method for breaking rock in mines (Summers, 1966). Where the ore was sufficiently soft or was much fractured it was broken by means of hammer stones and iron gads. Other tools used for mining included iron hoe for removal of surface soil and softer earth, wooden wedges and iron chisels. Ores yielding less than ~60-85 grams per tonnes were considered not worth treating (Summers, 1966).

Besides extraction of ore from open stopes and underground works, the pre-colonial small-scale miner was also involved in panning gold that occurred in alluvial deposits either in or beside rivers. These placer deposits, by their very nature, tended to be relatively easily and swiftly worked out. As a mining technique, the washing of alluvial gold probably predated the extraction of gold from reefs (Phimister, 1974). Favourable conditions for the deposition of workable deposits of alluvial gold were largely confined to the eastern and northern parts of the country and as such, the Angwa, Mazoe and Ruenya rivers were of significance as far as panning was concerned. Areas in Manyika where most rivers are

often perennial were and are still also of particular importance. Wooden and clay dishes were utilised for panning, and no chemicals were used in the process.

As the indigenous miners had no means of pumping water from their mines, water presented an insuperable problem and therefore, the water table became a limiting factor in pre-colonial mine workings (Phimister, 1975). Inadequate ventilation was also a problem which might have caused the early miners to abandon some mines before they were exhausted. This was probably because of the need to remove the noxious gases produced from burning in confined spaces during fire-setting. Both reef and alluvial gold mining were seasonal activities to the pre-colonial miners and were mostly confined to the winter months, that is, the period after harvesting and before planting commenced. This period also coincided with the seasonal fall in the water-table which made reef mining viable at greater depths, while gold washing was concentrated in this period to take advantage of any gold deposited by the floods at the beginning of the previous rainy season.

Colonial Period

The coming of the colonial miners in 1890 did not immediately bring change to mining methods that were used by the pre-colonial miners. There was some continuity in the mining methods used for the first decade of colonial occupation and thereafter by the small-scale operators. Furthermore, for some years after 1890, as in the pre-colonial period, mining was largely confined to the dry season because no pumps had been brought into the country. The initial hoisting technique used was a simple windlass made from Msasa tree. However, the coming of the colonialist saw the development and construction of railway and roads in the period 1903 to 1929 which allowed mining equipment to be brought to mining sites. With this development the small-scale miner was able to use boiler, pump, explosives and mechanical hoisting with a windlass for his mining activities. Even when the equipment became available in the country, the seasonal aspect remained characteristic of those small-scale miners who could not afford expensive underground pumping facilities. The small-scale miners operated either as individuals or as a syndicate. Until the extension of roasting plant facilities to the small-scale miner in the 1930s they, like the pre-colonial miners, were restricted in their mining operations as they could not work the more difficult zones. The grades economically mined in this era varied from 6 to 10 grams per tonne.

Post-colonial: Today's small-scale miner still practices mining in the dry season when conditions are naturally favourable because he cannot afford the necessary equipment to work throughout the year. However, with pumping equipment and better illumination, small-scale miners with access to funding could work underground mines to a greater depth than that which was achieved by the pre-colonial miners. Ore is extracted from shallow surface pits and from archaic underground workings reaching the water table, which can be as deep as 30 metres, using hammers, chisels, picks and shovels. When possible, explosives and hired compressors can be utilised for underground operations to advance workings. Extracted ore is hauled to the surface in buckets or calabashes by a steel cable or rope with a manual windlass. The same implements are used to pump out water which often seeps into the pit bottom. The miners work in syndicates of 4/5 people with an average production of 25 tonnes of ore per month. On accumulating enough ore, it is transported to the nearest mill for the recovery of the gold. Ores containing 4 grams per tonne can be economically extracted. Formal small-scale mining in Zimbabwe is therefore, still characterized by the extensive use of human energy aided by simple hand tools.

Processing Techniques

Once the ore is mined the next stages are the liberation and separation of the value metals from the waste materials of the ore. Liberation is achieved by the processes of crushing and grinding the ore while

separation is by the utilization of the difference in the physical characteristics of the value metals and the waste materials.

Pre-colonial: Liberation was achieved manually by the pre-colonial small scale miner by use of stone mortars. These were commonly known as ‘*dolly holes*’ (Figure 1), and were more or less cylindrical holes carved on hard rock outcrops near entrances to some of the mines (Anderson, 1961). Besides the use of ‘*dolly holes*’ for crushing various other devices were also known to be used and these included conventional grindstones like those used for grinding grain and rocking stones. Roasting of ore to facilitate crushing is also reported to have been used. After suitable crushing the liberated gold was recovered from the crushed rock by panning or sluicing to remove sands. The lighter quartz was washed away by sluicing with water or the gold was concentrated by panning using a shallow wooden or clay bowl. Water always played a crucial role in the final recovery of gold from crushed quartz. The *dolly-holes* themselves were invariably near water sources, generally in or near rocky stream beds. The resultant gold dust was then packed in suitable containers, with porcupine quills being used for small quantities. No chemicals were used and only free gold was recovered. A similar technique was used for the recovery of alluvial gold, though the crushing and grinding stage was not necessary. The milling and recovery processes were laborious and not efficient.

Figure 1: ‘*Dolly holes*’ used by pre-colonial miners to liberate mineral (source the *Mineral resources of southern Rhodesia*, Anderson, 1961)

Colonial Period: This era is characterized by the use of chemicals for the recovery of gold from the ore. Typical equipment used consisted of a small crushing plant and a cyanide plant. The crushing plant was often a two-stamp, three-stamp or five-stamp depending on production capacity. Copper amalgamation plates were used for the recovery of free gold, while the tailings from the copper plates were subjected to a cyanidation process. The use of cyanide increased the total amount of gold that the miner was able to recover. Processing of reef ores was in the hands of the whites and the natives were restricted to panning alluvial ores using the same methods and equipment that the pre-colonial miners used.

Post-Colonial : The boom in post colonial small-scale mining activities as an alternative income earner to the other depressed economic sectors in the 1990s saw the emergence of custom milling services in which the millers liberated and concentrated the ore on behalf of miners for a fee (Metcalf, 2008). The technology employed for custom milling centres varies from site to site. Liberation is normally achieved either through the use of stamp mills with a capacity in the range of 0.5-1.0 tons per hour or via a combination of jaw crushers and ball mills with capacity in the range 0.7-2 tons per hour. The use of

hammer mills has also found application in the sector. However, despite its inefficiency in gold liberation the stamp mill is the preferred technology by most small miners.

At the end of milling process, the ground ore is passed through a gravity concentrator for the recovery of free gold. The concentrators used include copper plates (introduced in colonial times), shaking tables, sluice boxes and centrifugal concentrators. Unfortunately, because these centrifuges are in reality not very efficient, the usual practice, just as in panning, is to introduce mercury into the concentrator, which is an environmental hazard. The mill achieves a recovery rate of 30% only, implying the miner loses 70% of gold contained in his ore to the miller who will later process the tailings by cyanidation.

For the recovery of alluvial deposits the processing methods used still include panning and sluicing as in the pre-colonial and colonial eras, and amalgamation which was introduced by the colonial small scale miners. Wooden dishes are still today's most commonly used pieces of equipment for panning along most of Zimbabwe's rivers. To improve gold recovery from both alluvial and reef ore deposits striated panning dishes, which trap gold in its furrows, have also been adopted by some gold panners. In some small-scale mining communities metallic dishes made from scrap metal sheet have replaced wooden dishes as the panners seek to improve efficiency. Sluice boxes are also commonly used especially in Insiza and Filabusi regions. The use of mercury, which the panners wrongly believe increases the amount of gold that can be recovered, has also found wide application by the post-colonial panners. This, however, has resulted in environmental contamination of rivers by the sector.

Economic Significance Of The Sector

Mining and in particular gold mining has played a significant role in the economic development of the country. It is a branch of production of considerable antiquity at various times in the pre-colonial times and has been an economic activity of utmost importance in both the colonial and post colonial times. Its significance is reviewed for the three historical epochs.

Pre-colonial Period

That mining was of considerable importance in the pre-colonial era is shown by the great number of '*ancient workings*' which have been found, about 4000 by the end of the nineteenth century (Summers, 1969), the number of crushing sites and evidence of early smelting. The pre-colonial miners were primarily involved in agricultural and pastoral activities with mining being a subsidiary activity done outside the agricultural season initially to meet local demand and later to supplement income through trade. Gold in the form of dust was mainly traded to pay for imports of beads, bracelets, ceramics, cloth, guns and gunpowder. Thus, the production of minerals created a surplus that permitted the acquisition of not only luxury goods, but also ammunition. This trade provided a new means of capital accumulation and consumer demands and resulted in the stimulation of economic specialisations such as gold mining (Miller *et al*, 2000). Gold mining and trading was also the basis for the foundation and expansion of polities at Great Zimbabwe and in the Khami area. Wealth and power of many empires and kingdoms such as the Mutapa State is believed to have also relied on gold trade (Phimister, 1975). However, the total amount of gold available for trade was considerably restricted by the laborious nature of gold recovery methods used and low recovery of the extraction methods. According to Summers (1969) of the total gold mined only 60 per cent was available for trade or local use, while the remainder was lost through inefficient extraction methods. Gold was also used by client rulers to pay tribute to their superiors in the late nineteenth century (Schmidt, 1988). The pre-colonial workings became the basis on which most of the modern gold mines are built on as they were simple surface indicator of mineral wealth. The development of a number of important large gold mines which later formed centres of commercial activity is a result of re-examinations of some of the pre-colonial small scale operations.

Colonial Period: The small scale mining industry has been of great benefit to the country, and from the efforts of the small scale miner several of the larger mines have developed. The output of gold production in Zimbabwe in colonial times, although not to the same scale as that of South Africa, was nevertheless of utmost importance to the national economy and ranked high in the list of world gold producers (Phimister, 1976). In the period when the large mines were faced with unprofitable production, which could be rectified through cost minimisation, it was the small scale producer who contributed to total gold production as they were able to adapt to harsh economic conditions by employing crude and dangerous cost-cutting methods. Cost minimization by small scale miner was not only limited to capital expenditure but was even marked by the very low level of cost of production achieved through the use of cheap African labour which represented a vital capital substitute and by the fact that he was the *all-in-one* (that is the owner, miner, timber-man, mining engineer and metallurgist). Through employment small scale mining sector provided a source of income for the Africans either on a permanent basis or temporally during the agricultural slack seasons. By 1912 there were about 35,000 Africans employed in the gold mining industry (Phimister, 1976).

Post-colonial Period: The importance of small-scale mining of gold to poverty alleviation and rural development in the post-colonial Zimbabwe is widely acknowledged (See in Hentschel *et al*, 2002). The sector (both formal and artisanal miners) contributed 5% to gold production in Zimbabwe in 1996 (Chimsasa, 1996). The Mining Journal 1996 edition of the Mining Annual Review (in Chimsasa, 1996) estimated the number of people involved in alluvial gold panning alone in Zimbabwe to be about 300,000. In 2002 the total number of people directly dependent on small-scale mining (of gold and other minerals) including those who provide services to the miners as well as dependents was estimated at over two million (Dreschler, 2002, p.132), a greater percentage of which is related to gold panning.

Small-scale mining is characterized by very short implementation periods. This has placed the sector in the post-colonial era in a strategic position to take full advantage of short-term booms in the mining industry (Maponga, 1991). The sector, while alleged to be haphazard, harbours an advantage in this – it can exploit small/disjointed deposits that normally prove unprofitable to bigger operations while also providing leads to large-scale deposits where mineralization proves continuous (Mungoni, 2008).

Gold panning has proved to be a viable income alternative to agriculture in the rural areas, especially because it is not seasonal, unlike agriculture. Most small-scale mining is labour-intensive, which means that it consumes small amounts of energy (Gocht *et al*, 1988, p.243) while also providing employment to many people. There are also downstream benefits and positive synergies associated with post-colonial small-scale mining which are created in the rural economy. These include expansion of the clientele base for rural business centres, creation of both capital and market for other income generating activities in the rural areas, *et cetera* (Mungoni, 2008; Gocht *et al*, 1988). It is also its natural linkage with economic and social development external to the communities through marketing, that the small-scale mining sector is regarded as a vehicle for poverty alleviation in the post-colonial Zimbabwe. However, the small-scale mining sector has failed to contribute significantly to regional development in terms of elaborate rural infrastructure. This is despite the fact that rural infrastructural development is one of the key benefits rural communities expect from mining activities (Gocht *et al*, 1988).

Government Support And Legislation

If small-scale and artisanal mining is to be developed into a vibrant sector that is both environmentally sound and sustainable, there is need for it to be supported by the government, NGOs and international organizations and there is also a need to put in place an enabling legislative framework which is specific to this sector only. This section looks at support programmes the sector has received over the three historical periods.

Pre-colonial: Ownership of the mines was apparently vested in the rulers as they seemed to have considerable degree of control over the working of gold deposits. In the districts of Mazoe a tax of half

the gold won was levied by the rulers (Phimister, 1975). Under the Mutapa State no one was allowed to extract gold without a licence from the Emperor. The mining of rich deposits was banned under the Mutapa state in order to protect against possible consequences of foreign greed. This could also be interpreted as protection of local miners by rulers against exploitation by the foreign traders whose terms of trade were unfavourable. By deliberately restricting mining production the rulers hoped for a higher price of gold. With the exception of few mines which were under the direct control of rulers, the small scattered gold production was serviced by a trading system operated by itinerant African traders known as 'vashambadzi'. This way the miners did not have to travel approximately six weeks to the Portuguese trading stations.

Colonial: Zimbabwe's robust small-scale gold mining was born in the late 19th century when Cecil Rhode's British South Africa Company (BSAC) received charters from the British Crown to administer Southern Rhodesia in 1889. The first mining legislation was specifically to promote the working of gold deposits by large companies as it allowed the BSAC to claim a 50 per cent share in mining operations (Viewing, 1984). However the gold of the region was not present in the vast quantities as that of the Rand and the opened mines were often in the hands of inexperienced individuals. This coupled with local conditions and geological constraints led the BSAC not to realise the anticipated substantial profits. The drawback saw the company in 1903/4 making revisions to mining legislation affecting mining and thus permitting individuals and syndicates to mine on a small scale instead of going to flotation as large companies. The concessions were restricted to crushing of not more than 750tons/month and where profits exceeded £100 monthly a 2.5 per cent royalty was payable. These changes in the mining law freed small producers from the expenses and problems of company flotation; consequently the small scale worker era. Further relief to the small scale miner was to be given in 1914 which doubled the amount of monthly revenue exempt from royalty to £200. The success of this support to colonial small worker is shown by the increase in numbers from 20 in 1904 to over 400 in 1923 (Anderson, 1961) each producing not more than 1000 ounces of gold yearly. The small scale miner also had access to capital on easy terms of repayment from the BSAC and certain local banks. The BSAC liberally supported small-scale mining activities (especially gold) in the early 20th century.

The government of that time also played a critical role in supporting the small scale operator as this era was also characterised by the setting up of infrastructure, facilities and departments at regional and district levels to support small scale mining activities. The regional offices each had a regional metallurgist, mining engineer, geologist and a mining commissioner. The country's Geological Survey was established in 1910 and its regional offices were established to guide underground small scale mines and to examine and give advice on their prospecting activities. 1928 saw the establishment of the Department of Metallurgy whose main purpose was to provide free laboratory and assay facilities to the small-scale mining sector. Staff from the departments can also be called on site to offer free technical assistance. In 1938, the Government established a custom roasting plant in Kwekwe to assist small-scale miners process refractory sulphidic gold ores. By 1938 there were over 1, 548 small-scale mining operations. The return of service members from World War II to the country offered another exciting opportunity to encourage individuals into small-scale mining. In 1945 the government introduced the ex-Servicemen Scheme whose aim was to first train returned soldiers in mining at the Guinea Fowl School (now the Zimbabwe School of Mines) and this was followed by giving them soft loans to start up their own mining operations or to re-open mines closed during the war. This scheme was considered as a success as it trained 221 men and 279 mines were re-opened which by 1952 had produced gold worth \$51 million (Viewing, 1984).

However this support from the colonial government for the sector benefitted mostly the white miners only as no black indigenous people legally owned or operated a mine. Blacks were mostly restricted to illegal panning activities along the major rivers.

Post-Colonial Period

Following the country's independence in 1980, the years after saw the birth and growth of the formal small scale black miner whose focus was mainly on gold and precious metals (Dreschler, 2001). As a way of promoting the development of the small-scale mining sector, the Zimbabwean government facilitated the registration of mining claims by charging a nominal registration fee and introducing and implementing a number of support programmes. Table 1 summarizes the support schemes that have been introduced by government over the years in order to benefit the post-colonial small-scale miners.

Table 1: Government Support Schemes

Support Scheme	Brief description
Plant hire purchase scheme	<ul style="list-style-type: none"> administered by Chief Government mining engineer small scale miners had access to mining and metallurgical equipment such as crushers, compressors, stamp mills, concentrators, drill rigs <i>et cetera</i> allowed hiring with eventual purchase of specific equipment equipment in frequent demand were limited to hiring only
Government loans	<ul style="list-style-type: none"> to purchase mines which were limited to Z\$25,000 (nominal terms) payable over years with fixed interest rate at 9% per annum to develop mines, that is, sinking a shaft, raising & developing a reef; failure to expose a workable ore by proponent resulted in the loan being written-off to set up milling plants including 6 months operating cost

This table shows the various support schemes by Government towards small scale mines

This support saw an increase in the number of registered claims from an estimate of 1,000 in 1983 to 10,000 by 1990 (Dreschler, 2001) and to more than 20,000 by the year 2000 (Maponga, 2003). The establishment of such a large number of small scale formal mines is credited to these financial schemes and the assistance offered through free technical advisory extension services to the sector by Ministry of Mines. However due to economic down-turn experienced at the beginning of the 21st century some of these services have since ceased to exist mainly due to lack of resources and experienced staff turn-over at the ministry. Miners are now being asked to pay commercial rates for the services which they used to get for free and thus excluding the group of people they were intended to service.

Non-governmental organisations, private sector and international organisations have also assisted the post-colonial small scale mining sector through setting up central processing facilities for use, for example, the Shamva Mining Centre established through the initiatives of ITDG, environmental and cleaner production technologies training and awareness campaigns, for example, UNIDO's Global Mercury Project (2004-2007). Other NGOs and international organisations which have provided a wide range of financial and technical support to the sector include EU Micro Projects, GTZ (Germany), COMIC RELIEF, SNV (Netherlands), TDH and AFSM (Austria). The private sector, especially the large mining companies, has also assisted the small scale miners with training in areas such as occupational health and safety through the Chamber of Mines. Save for GTZ and SNV this support by NGOs and government however has been directed towards the formal small scale mining with none going towards the poverty driven illegal panners. This is attributed by Maponga (2003) to the way in which the formal mining communities, both small and large, view panning activities. In most cases there are no follow ups by the government on programmes which will have been initiated by the NGOs as the government lack capacity.

CONCLUSION

Mining and processing methods among the small-scale miners have not significantly changed over time. This is partly due to lack of technical know-how and the financial resources to purchase vital capital

equipment. Their operations have also been limited by the geological nature of gold deposits which are not amenable to highly-mechanised exploitation. However, one conspicuous landmark in the evolution of processing methods was the introduction of custom milling in the post-colonial era, which has been helpful to small-scale miners who cannot set-up their own mills. Economic contribution of the sector has evolved in character, but generally remained significant throughout the three historical epochs. The major criticism against the sector in this regard is its failure to make direct contribution towards rural/regional infrastructural development, which is one area in which mining is expected to make an impact. The general mining legislation has never made explicit provisions for the small-scale miner. However, the paper notes that the sector has received positive support in the form of specific statutory instruments, Government loans and technical extension services, which were more promulgated in the colonial era and the early post-colonial period. The study concludes that, given consistent legislative, financial and technical support, the small-scale miner can significantly improve efficiency, effectiveness and profitability of his/her operations, as well as contribution to regional and national economic development of the country.

IS INFLATION ALWAYS AND EVERYWHERE A MONETARY PHENOMENON? THE CASE OF NIGERIA

Doyin Salami, Lagos business School, Nigeria
Kelikume Ikechukwu, Lagos business School, Nigeria

ABSTRACT

In response to shocks emanating from the global financial crisis of 2007-2008 the Central Bank of Nigeria has continuously used tight monetary policy instrument to check volatility in the general price level. The success of using monetary policy tool to influence the movement of key macroeconomic aggregates in Nigeria rests solely on the question of whether inflation is driven purely by changes in monetary aggregates. Using quarterly time series data for Nigeria over the period 1970 to 2011, we test the quantity theory relationship between money and price movement to establish if inflation is always and everywhere a monetary phenomenon. Using the autoregressive distributed lag (ARDL) modeling approach we obtained a robust estimate for Nigeria. The result of the study showed that inflation is not always and everywhere a monetary phenomenon in the case of Nigeria raising serious doubt on the continuous use of monetary policy tool to achieve price stability in Nigeria.

KEY WORDS: Money Supply, Monetary Policy, Policy Regulation, Time series Model

INTRODUCTION

The Nobel Prize winning economist Milton Friedman once postulated that “inflation is always and everywhere a monetary phenomenon” (Friedman, 1956). His argument was anchored on the classical quantity theory of money which establishes the existence of a direct functional relationship between money supply and the general price level with aggregate income and the velocity of transaction remaining constant (Lothian, 2009; Selgin, 2008). Given these perceived relationship, the Central Bank uses monetary policy instrument to influence the availability and cost of credit with the ultimate objectives of achieving price stability, sustainable economic growth, balance of payment equilibrium and full employment level (Mishkin, 2000). In recent years, a growing consensus has emerged for price stability to be the overriding long-run goal of monetary policy (Mishkin, 1998). However, the effective prediction of the money growth inflation relationship depends to a large extent on the existence of a stable and predictable relationship between monetary aggregates, inflation and the output in the economy.

If the money market is largely underdeveloped and the relationship between the chosen monetary aggregates and the ultimate policy objective are weak, monetary targeting becomes a very weak instrument (Panzer, 2011; Nachega, 2001). In Nigeria, the focus for monetary policy since the inception of the Central Bank of Nigeria (CBN) in 1959 has been to stamp out incipient inflationary risk and maintain a sustainable growth in output level. To achieve these intermediate and broad policy frameworks, the country has experimented two different regimes of monetary policy—the exchange rate targeting regime (1959-1973) and the monetary targeting regime (1974-to date) (CBN, 2008). The shift from exchange rate targeting to monetary targeting regime in 1974 was done with the sole aim of mitigating inflationary pressures arising from increased public expenditures and anchored on the premise that inflation is a monetary phenomenon. Evidences from monetary targeting in Nigeria has however shown that monetary policy had always encountered problems and the ultimate target of low and stable price levels enacted by successive administrations may be driven by some forms of structural rigidities

inherent in the Nigerian economy (CBN 2008). Consequently, this brings to focus the issue of whether inflation is always and everywhere a monetary phenomenon in Nigeria and the rational of pursuing stability in the general price level with the use of purely monetary aggregates.

The aim of this study is to test the quantity theory relationship between money and prices in Nigeria with a view of establishing whether the notion that inflation is always and everywhere a monetary phenomenon holds true for Nigeria. Following the introductory section, the other parts of the paper is structured into four sections; section two is the literature review while section three is expressed views on the data set and methodology of the study. In section four, we present the empirical analysis while section five is the conclusion and policy implications of the study.

LITERATURE REVIEW

The quantity theory of money holds that an expansion of the money stock does not increase output in the long-run with a focus on average inflation and money growth over successive time intervals (Friedman, 1984). Consequently, it has been confirmed that prices increase in the short run due to scarcity in the supply of some essential products which may not have an influence on the rates of inflation in the long run, because such rates of inflation can be controlled by contractionary monetary policies (Barro and Sala-i-Martin, 1995; Rolnick and Weber, 1998; Kernal, 2006). Some scholars are of the opinion that inflation is a monetary phenomenon, taking into consideration longer run studies and that it is greatly encouraged by structural policy issues (Khan, 1980; Grauwe and Polan, 2005; Khan and Schimmelpfennig, 2006). Kernal (2006) stated that long run money supply impacts the inflation rates and that the quantity theory of money holds in the long run, emphasizing that inflation is a monetary phenomenon. In the short run, he noticed that the tendencies for money to influence inflation is not quick, he disclosed that it takes approximately three quarters. He noticed that with persistent rates of inflation, and consistent shocks in gross domestic product, money supply and price in the economy.

Cecchetti (2000) noticed that high and persistent inflation in any economy, act as a repressive tax, with impending consequences for those who are asset-poor and hold their entire savings only in cash. Also, inflation has been detected to be harmful to economic and financial sector growth, impede resource allocation and societal welfare (Whitehead, 1976). While Aisen and Jose'Veiga (2006) evidences showed that the effect of inflation on the economy may be politically costly for the government due to its socio-economic impact in the country. To effectively evaluate the impact of inflation and put in place policies to guide its effect on the economy, it is necessary to disclose, if inflation everywhere is a monetary phenomenon (Friedman, 1956). To justify this fact, it is essential to first analyze if constraints in supply side factors cause inflation to increase and persist without any form of monetary accumulation (Bernanke, 2005). To analyze the link between inflation, the growth rate of money and the inflationary experiences of a stated set of economies, they used the panel-data technique to test for the quantity theory relationship between money and inflation in accordance to the Friedman's principle (Friedman, 1956). This principle stated changes in money supply growth lead to equal proportional changes in the inflation rate, through the forces of the Fisher effect, in the nominal interest rate (Grauwe and Polan, 2005). Subsequently, long run money affected the price level and not the level of output. Thus, the stated level of inflation in an economy will be considered a monetary phenomenon. The most appropriate solution to redeem this situation will be controlling the supply of money in circulation (King, 2001).

Subsequently, they resolved that there is a strong positive relationship between long run inflation and the growth rate of money, such that when money growth increases by distinct percentage, the rates of inflation also raise by the same proportion. Hence, in the long run, there is neutrality between money growth and output growth from one perspective and the velocity of changes from another perspective (Grauwe and Polan, 2005). This strong link was noticed to be due to the hyper-inflation in the data set of countries used in the model. Also they disclosed that inflation and money growth for low-inflation

countries is weak. Examining core inflation as the component of measured inflation that has no medium and long run impact on real output, in accordance with the Phillips curve analysis of co-movement in inflation and output. Quah and Vahey (1995) introduced the vector auto-regression model with restriction on the dynamic process. Goodfriend (2000), King (1999), Blejer and Leon (2000), and Blejer, Ize, Leone and Werlang (2000) supported the view that this study method is important because it will analyze the efficiency of monetary policies to stabilize prices.

They disclosed that monetary factors are the main determinants of recent surge in inflation. Also, the economic growth variable (GDP growth) and the prices of major consumables matters; while exchange rate appreciation play very little roles. In the long run, movement in the rates of inflation and the growth in money supply, follow a one to one relationship, relative to real income. This relationship was also same for growth in real income and the velocity of money. From their analysis, it stands sure, that excess money supply is the main cause of inflation. Since the proportional relationship between the excess money supply is over that of the output growth and the velocity growth. Therefore, these studies proposed that for policy makers to control for this situation, they should put in place tight monetary policy measures. Also, such monetary policy formulation must strictly take into consideration activities in the real and financial sectors and treat them as constraints on policy.

METHODOLOGY

Data Source

The data used for this study cover 42 years period (166) quarterly observations. Beginning from 1970 quarter 1 and ending in 2011 quarter 2. The source of the data is from the Central Bank of Nigeria Statistical Bulletin and the Published bulletin of the National Bureau of Statistics Nigeria. The two major variables used in the study are the money supply variable (Broad Money M2) and the Price variable proxied by GDP deflator..

Model Specification

The theoretical base of the views that inflation is always and everywhere a monetary phenomenon can be traced to one of the oldest theories in economics-the classical quantity theory of money and to Friedman (1963). In its simplest form, the quantity theory of money says that there is a direct proportional relationship between changes in money supply growth and inflation. This presupposes that changes in money supply growth are followed by an equal change in inflation and, by the force of the Fisher effect¹, in the nominal interest rate. Using the quantity theory money, we will attempt to explain the extent to which price movement is caused only and purely by monetary forces.

The famous equation of exchange is modeled as;

$$MV=PY \dots \dots \dots (3.1)$$

Where; M is a suitable measure of money supply (in the case of Nigeria, we use M2-broad money supply which is a better measure of the stock of money supply.)

V is the income velocity of money obtained by $Y \cdot P / M$ (See Muskin, 2008; P. 19)

P is the aggregate price level proxied by the GDP deflator a better and much broader measure of the general price level

Y is the real gross domestic product GDP.

By expressing equation 3.1 in growth form, we let the lower case letters denote logarithms allowing us to express equation 3.1 as;

$$m + v = p + y \dots \dots \dots (3.2)$$

From equation 3.2, we can express the inflation equation as;

$$p = m - y + v \dots \dots \dots (3.3)$$

From equation 3.3, we can obtain three basic elements of the quantity theory of money.

- (i) There exist a long run proportional relationship between growth in money supply and growth in the general price level.
- (ii) A permanent increase in the growth rate of money supply leaves output and velocity unaffected in the long run.
- (iii) From the quantity theory of money, we can ascertain the time it takes growth in the general price level to respond to changes in the growth in money supply and output.

To obtain a reliable estimate of the short run and long run relationship between growths in general price level and growth in money supply, we will make use of the autoregressive distributed lag (ARDL) modeling technique. The (ARDL) modeling approach is much more flexible than the other methods available for conducting co integration test such as the residual based Engle-Granger (1987) test, the maximum likelihood based Johansen (1991; 1995) test and the Johansen-Juselius (1990) test. The uniqueness of the ARDL approach is that it can be applied to variables with different order of integration (Pesaran and Pesaran 1997).and it takes sufficient number of lags to capture the data generating process in a general-to-specific modeling framework (Laurenceson and Chai 2003).

In order to test the monetarist specification that inflation is always and everywhere a monetary phenomenon, we examine the inflation-money supply relationship drawn from equation 3.1, under the assumption that velocity of money (V) and income (Y) is constant. The model is represented as;

$$gP_t = \alpha_0 + \alpha_1 gM2_t + \alpha_2 gY_t + \alpha_3 gV_t + U_t \dots\dots\dots 3.4$$

Where;

gP_t = Rate of change in the level of consumers price index CPI

$gM2_t$ = Rate of change in broad money supply

gY_t = Rate of change in real GDP

gV_t =Rate of change in velocity of money

U = Stochastic disturbance factor.

On apriori, in the long run $\alpha_1=1$, $\alpha_2 < 0$, $\alpha_3 > 0$, $gM2$ and gY are uncorrelated.

Theoretically, there is a direct functional relationship between money supply and the general price level. However, the money supply variable may influence the general price level with a time lag. This allows us to incorporate lags of money supply in the regression. Furthermore, the price variable may be correlated with lag of itself suggesting that lags of the price variables should be included in the regression as well. The inclusion of lags of the dependent variable and lags of the explanatory variables into the regression motivates the commonly used ARDL (p,q) model or the unrestricted ECM model defined as follows;

$$\Delta gP_t = \alpha_1 gP_{t-1} + \alpha_2 gM2_{t-1} + \alpha_3 gY_{t-1} + \alpha_4 gV_{t-1} + \sum_{j=1}^{p-1} \gamma_j \Delta gP_{t-j} + \sum_{j=1}^{q-1} \lambda_j \Delta gM2_{t-j} + \sum_{j=1}^{q-1} \psi_j \Delta gY_{t-j} + \sum_{j=1}^{q-1} \delta_j \Delta gV_{t-j} + u_t \dots\dots\dots (3.5)$$

In equation 3.5, the term in summation signs represents the error correction dynamics while the term with the coefficient α 's corresponds to the long run relationship. The ARDL method estimates $(P+1)^k$ number of regressions in order to obtain the optimal lag for each variable where p is the maximum number of lags to be used and k is the number of variables in the equation. Given that we are using quarterly data, we select 4 lag as our maximum lag (P) following Pesaran and Pesaran (1997) to test the robustness and reliability of the regression estimate; we conduct the diagnostic and stability test for the model.

EMPIRICAL ANALYSIS

Before estimating the ARDL model, we tested for the presence of unit roots among the variables with the aid of the Augmented Dickey-Fuller test of unit roots. The result of the unit root test is reported in Table 1

below. The result shows the growth in price level, growth in money supply; output growth and growth in velocity of transaction were all stationary at levels giving no room for differencing the variables further. Although, cointegration test methods based on Johansen (1991; 1995) and Johansen and Juselius (1990), requires that all the variables be of equal degree of integration, this is however not a requirement for the ARDL approach which combines variables irrespective of their order of integration (Pesaran and Pesaran 1997).

Table 1: Unit Root Test on Variables with Intercept and a Linear Trend

Augmented Dickey-Fuller (ADF) Test		
Variables	Levels	Status
gP	-4.958*	I(1)
gY	-12.905*	I(1)
gM2	-14.262*	I(1)
gY	-14.288*	I(1)

This table shows the results of the Augmented Dickey-Fuller (ADF) Unit Root test.

Note *Implies variable is stationary at 1% levels.

The short run dynamic model is shown in Table 2. The coefficient of money supply is not statistically significant at the second and third quarter lags but is significant at the first lag at the 10 percent levels. The variable is however wrongly signed indicating that a change in money supply in the previous one quarter has a statistically significant negative impact on change in the current price level. Only in the third lag did the growth in money supply variable exhibit a positive impact on growth on changes in the current price level but not significantly so.

Considering table two below, changes in output growth had a negative and insignificant impact on current price level in the first, second and third lag respectively. The variable had the right sign. Recall that the quantity theory of money predicts that over a significantly long period, changes in the growth of money do not affect output growth. The velocity variable had the right sign only in the second and third lag and passes the test of significance at the 5 percent levels of significance only in the second lag. The lag price variable is the most significant variable in the model affecting current change in the price level. The variable had a negative but significant impact on current changes in the price level and easily passing the test of significance at the 1 percent levels in the first, second and third lags respectively.

Table 2: Estimated Short Run Coefficients

Dependent Variables gP n=166 after Adjustment (1970Q2-2011Q3)				
Regressors	Coefficients	Standard Error	T-Statistic	Prob.
C	-0.0054	1.1119	-0.0048	0.9961
$\Delta gP(-1)$	-0.5424	0.1172	-4.6353*	0.0000

This table displays the outcome of the estimated Short-run coefficients.

Note * Significant at 1% levels, ** Significant at 5% levels and *** Significant at 10% levels

The coefficient of ECM_{t-1} is found to be relatively large in magnitude and is statistically significant at the 1 percent level. It demonstrates the existence of long run relationship between the variables, with the coefficient term -0.5189, suggesting a fast adjustment process. Nearly 51 percent of disequilibrium of the previous quarter's shock adjusts back to equilibrium in the current quarter. Overall, the result shows that changes in lag past price levels and the velocity of transaction are the most significant variable influencing the current price movement in the short negating the monetarist claim that inflation is always and everywhere a monetary phenomenon. The result of the long run relationship is reported in Table 3. The growth in money supply had the wrong sign and is not statistically significant as shown by the probability value of 0.9013. The coefficient value of -0.0017 is close to 1 as indicated by the quantity theory of money specification but the negative sign negates the long run proportionality relationship between growth in money supply and growth in price level.

Table 3: Estimated Long Run Coefficients

Dependent Variable gP n=166 after Adjustment (1970Q2-2011Q3)

F-Stat. 30.70		DW-Statistic 2.17		

Table 3 above shows the long-run coefficients of the equation estimated for the study.

Note * Significant at 1% levels, ** Significant at 5% levels and *** Significant at 10% levels

The coefficient of output growth had the expected sign; it is low in value and is statistically significant at the 1 percent level indicating that changes in output in the long run has a significant negative effect on growth in the general price level. The velocity variable had the right sign but failed the test of significance at the 1 percent and 5 percent levels of significance. The coefficient of determination value of 0.36 and adjusted coefficient value of 0.35 show that over 75 percent systematic changes in the growth in the general price level is left accounted for by the error term an indication that other factors that are likely to induce changes in the general price level in Nigeria is left unaccounted for by the model. The F-statistic value of 30.7 shows the overall model has a good fit and the Durbin-Watson value of 2.17 shows the likely absence of serial correlation in the model. Recall that, the quantity theory predicts that over a sufficiently long period, changes in growth rate of money supply do not affect output growth. This is the neutrality position. To test this position, we estimated output growth as a linear function of growth rate of money supply. The result obtained is reported in Table 4.

Table 4: OLS estimation of Output Growth on Money Supply

Dependent Variable gP n=166 after Adjustment (1970Q2-2011Q3)				
Regressors	Coefficients	Standard Error	T-Statistic	Prob.
gM2	-0.0171	0.0545	-0.3135	0.754
C	6.5900	3.595	1.833***	0.068
R-Squared 0.00059		R-Bar-Squared -0.0054		
F-Stat. 0.098		DW-Statistic 2.009		

The table above demonstrates the OLS estimates of Output Growth of Money Supply in Nigeria.

Note * Significant at 1% levels, ** Significant at 5% levels and *** Significant at 10% levels

The result shows the effect of higher money growth on output growth is negative and not statistically significant. This confirms the quantity theory of money prediction that an expansion of money stock does not increase output in the long run and the findings is in line with the conclusion of Barrow and Sala-i-Martin (1995).

CONCLUSION

This study originally set out to address the monetarist claim that inflation is always and everywhere a monetary phenomenon. Using quarterly data obtained from the Central Bank of Nigeria Statistical Bulletin over the period (1970Q1-2011Q2) we tested the quantity theory of money proposition that there exist long run proportionality between money growth and inflation and that there exist a long run neutral relationship between money growth and output growth and velocity growth. Our findings are summarized as follows. First, we find a weak negative and statistically insignificant relationship between long run money supply growth and inflation negating the quantity theory of money proposition that the relationship is one of proportionality. This is in line with earlier studies for low inflation countries and EMU countries (Grauwe and Polan 2005). Secondly, we find money growth and income growth to be weakly linked in the long run suggesting that monetary policy tools may not be effective in controlling and influencing macroeconomic aggregates in Nigeria. Finally, we found that there exist a long run relationship between money growth, inflation, output growth and velocity of transaction. The adjustment process between the short run and long run period is fast. Specifically, nearly 51 percent of disequilibrium of the previous quarter's shock adjusts back to equilibrium in the current quarter. This study has serious policy implications for policy makers in Nigeria and other low income countries that have continuously based their monetary policy strategy on the premise that "inflation is always and everywhere a monetary phenomenon". Our result indicates that this is not true for Nigeria and that the continuous use of monetary policy tool to maintain price stability is not likely to yield the desired medium to long term monetary policy goals.

Limitations

In this study, we undertook a dynamic research to determine if the levels of inflation in Nigeria are driven by excess liquidity in circulation from the perspective of the quantity theory of money. Basically this is to ascertain if the theoretical concept as proposed could be justified for the case of Nigeria. We noticed that an in-depth study which will consider money market operations; issuance of government securities in primary market, repurchase agreement, interest payment of government domestic debt and sales of foreign exchange in order to clarify pending issues on excess liquidity and monetary policy in Nigeria.

APPENDIX APPENDIX A

A1: Plot of Cumulative sum of Recursive Residuals

A2: Plot of Cumulative sum of Squares of Recursive Residuals (CUSUM of Squares) from 1975 to 2010. The y-axis ranges from -0.2 to 1.2. A solid blue line represents the CUSUM of Squares, which shows a clear upward trend. Two dashed red lines represent the 5% significance bounds, sloping upwards from approximately -0.1 in 1975 to 1.1 in 2010. The CUSUM of Squares line crosses the upper bound around 1995 and remains above it until 2010.

US GAAP CONVERSION TO IFRS: A CASE STUDY

John Phelan, University of New Haven

Peter Harris, New York Institute of Technology

Liz Washington Arnold, The Citadel, The Military College of South Carolina

J. K. Yun, New York Institute of Technology

ABSTRACT

International Reporting Standards (IFRS) has become the required framework for most of the world financial market economies as of January 1, 2011. In the United States, US Generally Accepted Accounting Principles (GAAP) is still required. However, plans are presently in place by the SEC to abandon US GAAP and to adhere to IFRS requirements by as early as for the period ending December 31, 2014. This case study requires the student to transform a US GAAP presented Financial Statement to IFRS.

MANAGERIAL OPPORTUNITIES AVAILABLE UPON LIFO (LAST IN FIRST OUT) REPEAL

John Phelan, University of New Haven

Steven Shapiro, New York Institute of Technology.

Peter Harris, New York Institute of Technology

Liz Washington Arnold, The Citadel, The Military College of South

ABSTRACT

The Last in First out Method (LIFO) is presently under severe scrutiny from the financial community which may soon culminate in its repeal as an acceptable accounting method. There are pressures from the SEC in conjunction with the International Financial Accounting Standards Board to standardize accounting standards worldwide. In addition, there is political pressure imposed by the US Obama administration to raise additional revenues. Both groups strongly oppose LIFO, raising a strong possibility that's its complete elimination as an accounting method will occur by as early as December 31, 2015. This paper examines critically the managerial implications and opportunities of LIFO repeal. The managerial opportunities are many and include; better inventory management, the potential to adapt the use of a Just In Time Inventory system, better financial statement reporting leading to a more favorable covenant situation, higher income reporting resulting in better financial ratios, lower administrative costs, no manipulation of income potential, more viable financial reporting for the investing public as reflected by a more precise balance sheet, advantages of an internal uses of a non-LIFO system and finally the prospects of lower tax rates as the US government has plans to eliminate tax loopholes like LIFO which will result in a tax neutral situation. Managerial taxation opportunities and recommendations in making this transition will also be addressed.

A STUDY OF ASPECTS OF LEARNING SKILLS AND MOTIVATION: CORRELATES TO SUPERIOR ACADEMIC PERFORMANCE

Richard Griffin, University of Tennessee at Martin
Angie MacKewn, University of Tennessee at Martin
Ernest Moser, University of Tennessee at Martin
K. W. VanVuren, University of Tennessee at Martin

ABSTRACT

This paper describes a study that was conducted at a mid-sized public state-university in the mid-south, USA, to examine various factors affecting student academic performance. In this study, the 10-scale Learning and Study Strategies Inventory (LASSI) assessment device was administered. This set of scales measures students' receptivity to skills and strategies that purportedly enhance one's ability to learn and successfully perform in an academic setting. Results from this instrument showed that the single most influential learning and study skill promoting positive academic performance was level of intrinsic motivation. To explore the individual aspects of motivation, the 8-scale Downing Self-Assessment Questionnaire was also administered. The Downing questionnaire examines motivational factors, for example, behaviors and beliefs, which might maximize one's potential for positive achievement in college. Along with motivation, the subscale measuring an attitude of life-long learning significantly predicted academic performance. The results of this study have pedagogical implications for helping students maximize their academic performance in college.

INTRODUCTION

It is of interest to academicians what personality characteristics, beliefs, and behaviors contribute most positively to student academic performance. In a recent study (Griffin. et.al., 2012) found that amongst learning and study skills, the student's level of motivation is the single most important determinant of superior academic performance. However, ambiguity persists as to specific beliefs and behaviors that constitute motivation in highly performing students. Morrison (1999) examined academic motivation by examining such aspects as study habits, academic confidence, family emotional support, career planning, among others. McKenzie, Gow, and Schwietzer (2004) examined learning strategies, achievement motivation, personality traits and other factors intrinsic to the individual that correlated with successful first year university academic performance. Ridgell and Lounsbury (2004) examined emotional intelligence and its implications for motivation in academic pursuits. Kim, et.al., (2010) extended their study to include such aspects of motivation such as competitiveness, time management, stress management, and involvement in extracurricular activities. Kanfer, et.al. (2010) examined over 25 measures of personality and motivational traits, such as conscientiousness, desire to learn, critical thinking, and goal orientation. Still other studies looked such motivational related characteristics such as self-discipline (Mumford, et.al.,1993), best learning styles (Williams, 1992), devotion to study time (Nonis & Hudson, 2006), and commitment to lifelong learning (Kirby, et.al., 2010; Wielkiewicz, et. al., 2005). All of the above are either aspects of motivation or have implications for motivation. The purpose of this paper is to examine the specific facets of motivation that could be correlated with superior academic performance.

Motivation For This Paper

The motivation for this paper is to bring additional clarity to the issue of determinants of superior academic performance in a business school setting. There is evidence from some prior research (Griffin,

MacKewn, Moser, and VanVuren, 2012) that motivation is a primary driver of superior academic performance as measured by student GPA. In the Griffin, et. al., study of 2012, the Learning and Study Strategies Inventory (LASSI) (Weinstein, et. al., 1987) assessment device was used to investigate various learning and study skills that arguably should enhance student academic performance. Of the ten subscales comprising the LASSI, the scale dealing with aspects of student's motivation was the scale with the strongest positive correlation with student GPA. Those results beg the question of "just what elements comprise student motivation?" If indeed it is true that a major determinant of superior academic performance is the student's motivation, an in-depth description and understanding of elements of motivation can help academicians in developing pedagogical approaches aimed at helping students maximize their academic performance.

Assessment Instruments And Subjects

Two widely known and statistically validated instruments were used to compile data concerning aspects of motivation. The first, the LASSI, is a series of ten subscales that measure parameters having to do with learning and study skills and strategies that logically should positively correlate with superior or improved academic performance. The ten subscales can be summarized as follows:

1. Anxiety (ANX) – addresses the degree to which one experiencing anxiety and stress in pursuing academic endeavors. This subscale is reversed scored, meaning that the lower the indicated anxiety, the higher the score. The logical assumption underpinning this structure is that high anxiety actually is counter-productive to high academic performance, thus reversing the score so that the higher the score, the more favorable the implication for superior academic performance. This makes interpretation of the ANX consistent with the other nine – the higher the score, the higher should be the impetus toward superior academic performance.
2. Attitude and Interest (ATT) – measures the degree that one has a positive attitude toward and is interested in academic pursuits. The higher the score on the subscale, the more interest indicated in academic matters, and the greater the level of superior academic performance that should be achieved.
3. Concentration and Attention (CON) – addresses the intensity of focus one applies to the pursuit of academic matters. The higher the score on the subscale, the greater the degree of concentration and focus applied.
4. Information Processing (INP) – measures the degree that one utilizes such techniques as imagery, verbal elaboration, and reasoning skills in academic pursuits. The higher the score on the subscale, the greater the degree of information processing applied.
5. Motivation (MOT) – addresses one's diligence, self-discipline, and willingness to exert effort in the pursuit of academic endeavors. The higher the score on the subscale, the greater the willingness to apply whatever effort is necessary to achieve a given academic goal.
6. Self-testing (SFT) – measures the degree to which one applies self-monitoring and review techniques to retain information relevant to a particular academic task. The higher the score on this subscale, the more the student uses self-monitoring and review techniques in studying and preparing for tests.

7. Selecting Main Ideas (SMI) – addresses one’s ability to identify main ideas and important points relevant to an academic task. A high score on this subscale indicates a high level of ability to identify and distinguish the important from the trivial.
8. Study Aids (STA) – measures the degree to which one utilizes study aids, such as textbook end-of-chapter problems/exercises, PowerPoint slides, within chapter boldfaces and highlights, etc. A high score on this subscale reflects a relatively high degree of usage of these tools.
9. Time Management (TMT) – addresses the efficiency in which one utilizes available time expended in the pursuit of academic endeavors. A high score on this subscale indicates that the student engages in a minimal degree of procrastination and strong control of non-academic distractions.
10. Test Strategies (TST) – measures one’s ability to effectively prepare for test-taking and then successfully execute the test-taking event. A high score on the subscale is indicative of a high degree of effective test-preparation and test-taking skills.

The average LASSI subscale scores generally range from the low-teens up to about 40, expressed as a percentile. As can be observed from the above subscale descriptions, the higher the score the better in that a high score in each respective attribute should most logically translate into greater/better academic performance. The second instrument used in this study was a questionnaire developed to assess freshman skills (Downing, 2005). The Downing Scale identifies eight key belief/behavioral factors that define a successful student. Distilling, via a factor analysis technique, from 64 individual questions, Downing came up with eight essential factors explaining superior student performance in academic affairs. Those eight factors can be summarized as follows:

1. Accepting Self-Responsibility (APR) – measures the degree to which one accepts personal responsibility for creating the outcomes and quality of their lives. The higher the score on this subscale, the more the student sees themselves as the primary cause of their outcomes and experiences.
2. Discovering Self- Motivation (DSM) – measures the degree to which one develops a motivating purpose in life as characterized by personally meaningful goals and dreams. A student with a high score on this scale finds largely finds purpose in their by discovering personally meaningful goals and dreams.
3. Mastering Self-Management (MSM) – addresses the degree to which one consistently plans and takes effective actions in pursuing their goals and dreams. The higher the score on this subscale, the more the student plans and takes purposeful actions in pursuit of their goals and dreams.
4. Employing Interdependence (EMI) – addresses the degree to which one builds mutually supportive relationships that assist in pursuing goals and dreams. A student with a high score on this subscale consistently interrelates with others to mutually move towards achievement of goals and dreams.
5. Gaining Self-Awareness (GSA) – measures whether one gains heightened self-awareness by developing empowering beliefs, attitudes, and behaviors conducive to achieving goals and dreams. The higher the score on this subscale, the more consciously the student employs beliefs, attitudes, and behaviors that keep them on course.

6. Adopting Lifelong Learning (ALL) – addresses whether one strives to become a lifelong learner, striving to find valuable lessons in nearly every life experience. A high score on this subscale indicates a high level of ability to extract learning and wisdom from most every experience in life.
7. Developing Emotional Intelligence (DEI) – measures the development of one’s emotional maturity as characterized by optimism, happiness, and peace of mind. A high score on this subscale indicates that the student effectively manages their emotions in support of their goals and dreams.
8. Believing in Myself (BIM) – addresses the degree to which one feels capable, lovable, and unconditionally worthy as a human being. A student with a high score on this subscale has a high level of self-confidence and feeling of self-worth.

The average Downing subscale scores generally range from low teens to around 80. The Downing Survey version used in this study is actually comprised of 64 individual questions – 8 questions each, via factor analysis, loading on the 8 factors or subscales indicated above. The possible responses to each question is structured as an 11-point Likert scale ranging from “totally false” to “totally true”. The eight aggregate Downing subscale scores are computed by taking the response values for four individual questions that should logically have a positive correlation with performance outcome, adding them up, adding 40, and then subtracting the sum of the response values for the corresponding reverse-worded individual questions that should have a negative correlation with performance outcome. Thus, the higher the score on the 8 factor subscales the better in that a high score in each respective attribute should most logically translate into greater/better performance outcome. In this study, the LASSI and the Downing questionnaire was administered to 45 freshman undergraduate students at a mid-sized public university in the mid-south, USA. Of the 45 students, 20 were males and 25 were females. Broken down by major, 25 were business majors and 20 were non-business majors. Most recent cumulative GPA was designated as a measure for academic performance. The GPA was observed at the end of the same semester in which the two survey instruments were administered to the students.

STATISTICAL METHODS AND RESULTS

The first step in our analysis of factors affecting academic performance is to observe the average scores of the 10 LASSI subscales and 8 Downing subscales. Table 1 shows the means and standard deviations of those subscales.

Table 1: 10 LASSI and 8 Downing Subscales - Descriptive Statistics

LASSI subscale	Mean	SD	Downing subscale	Mean	SD
Anxiety	26.42	6.03	Personal Responsibility	60.15	11.60
Attitude	31.11	4.04	Self-Motivation	55.83	12.19
Concentration	27.53	5.47	Self-Management	56.58	12.35
Info. Processing	27.89	5.67	Interdependence	44.53	10.07
Motivation	32.20	3.92	Self-Awareness	52.11	13.00
Self-Testing	24.89	5.54	Lifelong Learning	48.21	16.85
Selecting Main Ideas	28.16	5.18	Emotional Intelligence	51.09	14.35
Study Aids (Use of)	24.51	5.33	Believing in Myself	58.38	12.19
Time Management	24.67	5.20			
Test Strategies	28.11	3.53			

Remembering that the higher the score the more strongly felt the attribute, the highest LASSI subscale mean (32.20) was Motivation – assessing the student’s diligence, self-discipline, and willingness to exert the effort requisite to achieve superior performance. The lowest/weakest felt subscale mean (24.51) was Use of Study Aids. For the Downing questionnaire, the highest subscale mean (60.15) was Accepting Personal Responsibility and the lowest (44.53) was Interdependence. Again, Personal Responsibility has

to do with the degree to which the student acknowledges ownership of their personal actions, rather than outside forces, as the primary cause of their outcomes and experiences. Aside from the mean scores of the LASSI and Downing subscales, the real issue is which, if any, of these attributes drive positive/improved academic performance? The answer to this question can be inferred by observing bivariate correlations of the LASSI and Downing subscale scores with GPA. Table 2 shows the results.

Table 2: 10 LASSI and 8 Downing Correlations with GPA

LASSI subscale	r	p-value	Downing subscale	r	p-value
Anxiety	0.095	0.534	Personal Responsibility	0.233	0.133
Attitude	0.279	0.064	Self-Motivation	0.410	0.007 **
Concentration	0.234	0.123	Self-Management	0.433	0.005 **
Info. Processing	0.140	0.358	Interdependence	0.222	0.152
Motivation	0.404	0.006 **	Self-Awareness	0.331	0.037 *
Self-Testing	0.150	0.326	Lifelong Learning	0.614	0.000 **
Selecting Main Ideas	0.146	0.339	Emotional Intelligence	0.171	0.284
Study Aids (Use of)	0.111	0.467	Believing in Myself	0.291	0.065
Time Management	0.063	0.682			
Test Strategies	0.218	0.151			

*Significant $p \leq .05$ **Significant $p \leq .01$

The only LASSI subscale that statistically correlated with GPA was Motivation ($r = .404$, $p = .006$). The positive correlation suggests that the higher the degree of student motivation, the stronger their academic performance. This is not a surprising result, but a result that also begs for clarification. The LASSI construct of Motivation is somewhat vague; but in that the Downing subscales can be viewed as addressing more detailed aspects of motivation, the Downing subscales can provide some of that clarification. Of the 8 Downing subscales, four of them correlated, with statistical significance, with GPA. Those four correlating Downing subscales were Discovering Self-Motivation ($r = .410$, $p = .007$), Mastering Self-Management ($r = .433$, $p = .005$), Gaining Self-Awareness ($r = .331$, $p = .037$), and Adopting Lifelong Learning ($r = .614$, $p = .000$). Each of these four subscales, from the descriptions that Downing has chosen to assign them, seem to have something to do with a person's deep-seated personal beliefs, attitude and motivations. Further analysis would allow for determination as to what these beliefs, attitudes, and motivations might be. Table 3 presents a summary of each of the 64 individual Downing questions correlations with GPA – but due to space considerations, lists only those individual questions that correlate, with statistical significance, with GPA.

Table 3: Significant Individual Downing Questions Correlating with GPA

Q#	Individual Downing Question	r	p
5	When I get off course from my goals and dreams, I realize it right away.	0.326	0.031 *
6	I'm not sure how I learn best.	-0.426	0.004 **
10	If I lose my motivation in college, I know how to get it back.	0.294	0.050 *
13	If I have habits that hinder my success, I'm not sure what they are.	-0.416	0.004 **
14	When I don't like the way that an instructor teaches, I know how to learn the subject anyway.	0.471	0.001 **
16	When I think about performing an upcoming challenge, I usually see myself doing well.	0.329	0.027 *
18	I don't know how to set effective short-term and long-term goals.	-0.494	0.001 **
22	I don't know how to study effectively.	-0.391	0.009 **
25	I make poor choices that keep me from getting what I really want in life.	-0.413	0.005 **
27	I lack self-discipline.	-0.464	0.001 **
29	I'm stuck with any habits of mine that hinder my success.	-0.441	0.003 **
31	I often feel bored, anxious, or depressed.	-0.462	0.001 **
37	I can be off course from my goals and dreams for quite a while without realizing it.	-0.343	0.023 *
38	I know how I learn best.	0.520	0.000 **
44	I know very few people that I can count on for help.	-0.419	0.004 **
46	If I don't like the way that an instructor teaches, I'll probably do poorly in the course.	-0.538	0.000 **
48	When I think about performing an upcoming challenge, I usually see myself doing poorly.	-0.301	0.047 *
54	I've learned to use specific study skills that work effectively for me.	0.379	0.011 **
57	I make wise choices that help me get what I really want in life.	0.323	0.033 *
58	I live day by day, without much plan for the future.	-0.343	0.023 *
59	I am a self-disciplined person.	0.492	0.001 **
62	When I face a disappointment (like failing a test), I feel pretty helpless.	-0.450	0.002 **

*Significant $p \leq .05$ **Significant $p \leq .01$

Of the 64 individual Downing questions, 22 correlate with statistical significance with GPA. The statistically significant correlation coefficients range from a high of .538 (Q46) to a low of .294 (Q10). The interesting thing to note from Table 3 is that every statistically significant question that positively correlates with GPA is one that one would expect to logically correlate positively. Likewise, every statistically significant question that correlates negatively with GPA is one that one would logically expect to have a negative correlation. There are no logical inconsistencies in the direction of the correlations. To add yet further clarity to the analysis, it is helpful to organize by subscale factor the 22 individual Downing questions that correlate with GPA. Table 4 shows the results.

Table 4 : Grouped by Factor - Significant Individual Downing Questions Correlating with GPA

Q#	Individual Downing Question	Mean	SD	P-value
Downing factor #1 - Accepting Personal Responsibility				
57	I make wise choices that help me get what I really want in life.	8.23	2.38	0.033 *
25	I make poor choices that keep me from getting what I really want in life.	3.67	2.63	-0.005 **
Downing factor #2 - Discovering Self-Motivation				
10	If I lose my motivation in college, I know how to get it back.	8.16	2.11	0.050 *
18	I don't know how to set effective short-term and long-term goals.	3.94	2.60	-0.001 **
58	I live day by day, without much plan for the future.	4.25	3.03	-0.023 *
Downing factor #3 - Mastering Self-Management				
59	I am a self-disciplined person.	8.28	2.68	0.001 **
27	I lack self-discipline.	3.31	2.52	-0.001 **
Downing factor #4 - Employing Interdependence				
44	I know very few people that I can count on for help.	3.43	2.62	-0.004 **
Downing factor #5 - Gaining Self-Awareness				
5	When I get off course from my goals and dreams, I realize it right away.	7.83	2.05	0.031 *
13	If I have habits that hinder my success, I'm not sure what they are.	4.65	3.01	-0.004 **
29	I'm stuck with any habits of mine that hinder my success.	3.55	2.58	-0.003 **
37	I can be off course from my goals and dreams for quite a while without realizing it.	4.25	2.79	-0.023 *
Downing factor #6 - Adopting Lifelong Learning				
14	When I don't like the way that an instructor teaches, I know how to learn the subject anyway.	6.5	2.44	0.001 **
38	I know how I learn best.	7.21	2.76	0.000 **
54	I've learned to use specific study skills that work effectively for me.	7.63	2.73	0.011 *
6	I'm not sure how I learn best.	5.1	3.05	-0.004 **
22	I don't know how to study effectively.	4.38	2.94	-0.009 **
46	If I don't like the way that an instructor teaches, I'll probably do poorly in the course.	4.73	2.89	0.000 **
62	When I face a disappointment (like failing a test), I feel pretty helpless.	4.67	2.97	-0.002 **
Downing factor #7 - Developing Emotional Intelligence				
31	I often feel bored, anxious, or depressed.	4.71	2.98	-0.001 **
Downing factor #8 - Believing in Myself				
16	When I think about performing an upcoming challenge, I usually see myself doing well.	7.37	2.78	0.027 *
48	When I think about performing an upcoming challenge, I usually see myself doing poorly.	3.67	2.61	-0.047 *

*Significant $p \leq .05$ ** Significant $p \leq .01$

The results of Table 4 are logically consistent with the results of Table 2, except that now more underlying detail can be observed. The subscale factors of Discovering Self-Motivation, Mastering Self-Management, Gaining Self-Awareness, and Adopting Lifelong Learning were correlated with statistical significance with GPA. From Table 4 it can be readily observed why those four factors fall out with the most statistical significance. For Downing subscale #6, Adopting Lifelong Learning (ALL), seven of the eight individual questions comprising that factor show statistically significant correlation with GPA. With a correlation coefficient of .614, this subscale explains 38% of the variance in GPA (see Table 2). Two of the individual questions comprising ALL had p-values of .000 – Q38, “I know how I learn best” (positive correlation) and Q46, “If I don't like the way an instructor teaches, I'll probably do poorly in the course” (negative correlation). The second strongest is Mastering Self-Management (MSM). The correlation coefficient is .433 ($p = .005$) and explains 19% of the variance in GPA. Only two of the eight individual questions comprising this factor show statistically significant correlation with GPA; but those two are both very strongly correlated – Q59, “I am a self-disciplined person” (positively correlated) with a coefficient of .492, and Q27, “I lack self-discipline” (negatively correlated) with a coefficient of $-.464$. Both of this pair of “reverse-worded” questions has a p-value of .001. Also correlating to GPA with statistical significance is Downing subscale #2, Discovering Self-Motivation (DSM), with a correlation coefficient of .410 and p-value of .007 and explaining 17% of the variance in GPA (see Table 2). Three

of the individual questions comprising DSM correlate with GPA with statistical significance, but for only one of the three is the p-value less than .01. That individual question is Q18, “I don’t know how to set effective short-term and long-term goals” (negative correlation) with a coefficient of $-.494$ and p-value of $.001$. From Table 2, it can be seen that the fourth and final Downing subscale to correlate with statistical significance with GPA is subscale #5, Gaining Self-Awareness (GSA). The correlation for GSA is $.331$ ($p = .037$), explaining 11% of the variance. As far as the individual questions comprising this factor, there are four statistically significant correlations, the two strongest of which are Q13, “If I have habits that hinder my success, I’m not sure what they are” (negative correlation) and Q29, “I’m stuck with any habits of mine that hinder my success” (negative correlation). Q13 has a coefficient of $-.416$ ($p = .004$) and Q29 has a coefficient of $-.441$ ($p = .003$).

Thus far the analysis has shown primary correlates to superior academic performance to be motivation, as measured by LASSI subscale five and an array of Downing constructs, but further analysis is warranted. This can be accomplished by running a series of regressions with GPA as the dependent variable and with LASSI subscale five and the most statistically significant Downing items as independent (predictor) variables so the question of which mix of LASSI and Downing subscales are most efficient and effective in predicting superior academic performance can be addressed. The first regression model loads as independent variables all of the subscales of the 10 LASSIs and 8 Downings that showed statistically significant correlation with GPA. Therefore, the independent variables for regression Model-1 are Motivation (LASSI #5), Discovering Self-Motivation (Downing #2), Mastering Self-Management (Downing #3), Gaining Self-Awareness (Downing #5), and Adopting Lifelong Learning (Downing #6). Results are presented in Table 5-1.

Table 5-1 Regression Model #1 - GPA the Dependent Variable

Independent Variables	t	sig.	F	sig.	adj. R-sq.
MODEL #1			5.971	0.001 **	0.422
LASSI #5 - Motivation	1.86	0.07			
Downing #2 - Self-Motivation	-0.37	0.72			
Downing #3 - Self-Mgmt.	0.70	0.49			
Downing #5 - Self-Awareness	-1.286	0.21			
Downing #6 - Life Learning	3.067	0.005 **			

*Significant $p \leq .05$ **Significant $p \leq .01$

Results of the regression indicate the model to be significant, $F(4, 41) = 5.97, p = .001$. The adjusted R-squared is $.42$, meaning that 42 percent of the variability of GPA is explained by these five variables. Note, however, that in this model only Downing #6, Adopting Lifelong Learning has statistical significance ($t = 3.067, p = .005$). The Motivation subscale on the LASSI is in the right direction, although non-significant, $t(39) = 1.86, p = .073$. Because Self Motivation, Self-Management, and Self-awareness lack statistical significance in this model they will not be included in the second regression analysis, using the LASSI motivation subscale and the subscale Downing Life Long Learner as predictors. Results are presented in

Table 5:2. Table 5-2 Regression Model #2 - GPA the Dependent Variable

Independent Variables	t	sig.	F	sig.	adj. R-sq.
MODEL #2			15.647	0.000 **	0.435
LASSI #5 - Motivation	2.44	0.020 *			
Downing Factor #6 - Life Learning	4.61	0.000 **			

*Significant $p \leq .05$ **Significant $p \leq .01$

The second regression model has a much higher $F(2, 41) = 15.65, p < 0.05$, however the adjusted R-squared of $.435$ is only slightly improved from that of the first model. Recall that the Downing questionnaire starts out as 64 individual questions, which are then factored down to 8 clusters of

subcategories via factor analysis. When looking at the structure of the 8 individual questions within each subscale, some are positively correlated and others are negatively correlated to that factor. Since multicollinearity could be a problem, a third regression was performed with the individual questions having statistically significant positive correlations loaded in predictors. Results indicated that only one individual question showed statistical significance as a predictor – Q59, “I am a self-disciplined person” ($t = 2.521, p = .017$). A fourth regression was also performed with all the individual questions having statistically significant negative correlations and loaded in as predictors. Again, only one individual question showed statistical significance as a predictor – Q18, “I don’t know how to set effective short-term and long-term goals” ($t = -2.447, p = .022$). Note that Q59 loaded on subscale #3, Mastering Self-Management, and Q18 loaded on subscale #2, Discovering Self-Motivation. Therefore, a third regression model (DV still GPA) was constructed with IVs of the LASSI subscale Motivation, Downing subscale Adopting Lifelong Learning), and Downing individual questions #59 and #18. Results are presented in Table 5-3.

Table 5:3 Regression Model #3 - GPA the Dependent Variable

Independent Variables	t	sig.	F	sig.	adj. R-sq.
MODEL #3			10.058	0.000 **	0.502
LASSI #5 - Motivation	1.38	0.179			
Downing Factor #6 - Lifelong Learning	2.48	0.019 *			
Q18 - setting goals	-1.22	0.231			
Q59 - having self-discipline	2.04	0.050 *			

*Significant $p \leq .05$ **Significant $p \leq .01$

Model-3 is a substantial improvement over the prior two models in terms of percentage of variance explained, $F(3, 41) = 10.06, p < 0.05, \eta^2 = .50$. Thus, the independent variables in this model account for just over half of the variability observed in GPA. The most predictive of GPA construct turns out to be Downing subscale #6, Adopting Lifelong Learning ($t = 2.481, p = .019$). The individual Downing question #59, having to do with one’s degree of self-discipline, also has statistically significant predictive ability.

CONCLUSIONS

In summary, this study accomplishes the goal of adding incremental clarity to the results of the prior Griffin, et. al., (2012) study. The primary finding of that study was that the primary learning and study skill, as defined by the Learning and Study Strategies Inventory (LASSI) that drives superior academic performance is simply the student’s motivation. Not surprisingly, the greater the student’s motivation, the better they perform in academic pursuits. This study confirmed that finding and then used the Downing Self-Assessment Questionnaire to delve deeper into aspects of motivation. The results of this study indicate, more specifically that amongst the strongest predictors of superior academic performance is the student’s self-perception of their degree of self-discipline. Again, not surprisingly, the more self-disciplined a student perceives themselves, the better they do academically. The Downing data also indicates that the other strongest predictor of superior academic performance is the subscale of Adapting Lifelong Learning (ALL).

Examining the detail of the ALL reveals that academic performance is enhanced by identifying a personal best learning style and then knowing specifically how to execute it. Finally, a student’s ability to ignore an instructor’s teaching style that the student does not like, and proceeding to learning the material anyway, is conducive to achieving superior academic performance. College and university teachers/instructors should emphasize to their students that these are perhaps the key attributes, among numerous other possibilities, that students should develop and pursue if one of their major life objectives is to do well in school.

Limitations And Future Research

This was an exploratory study and the sample size of 45 was not large enough to provide statistical power usually expected for a study of this nature. Furthermore, the usual reservations concerning insufficient statistical validity and reliability are certainly appropriate regarding this study.

One might argue, also, that there are better constructs other than the LASSI and Downing subscales to serve as predictors of academic performance. One might even argue that there are more appropriate measurements other than GPA to serve as proxy for academic performance. In that the LASSI and the Downing questionnaire are both self-assessment instruments, it should also be pointed out that the study may have been diminished by various response biases. Some of the above limitations can be addressed by replicating the study with a larger sample of respondents drawn from a more diverse population of students. Statistical reliability can be more strongly established by replicating the study with other student sample groups drawn from other universities.

A FRAMEWORK EXPLAINING HOW CONSUMERS PLAN AND BOOK TRAVEL ONLINE

Michael Conyette, Okanagan College

ABSTRACT

The dynamics of online searching and purchasing is becoming better known and understood as researchers study various products sold via the Web. Even though there is a prevalence of travel products purchased online, integrated frameworks that identify the various determinants of the decision process and how they interact is still sparse in travel literature. In this study, a Conceptual Framework was developed showing the connection between online searching, planning and booking of leisure travel products and the relationship between these variables is tested using logistic regression. It confirms that consumers plan then book travel and that beliefs and attitudes influence intention to book travel online. Furthermore, beliefs about travel agents affect beliefs and attitudes towards online searching. This study aims to make a contribution by testing for the first time the relevant variables of planning and booking in a proposed Framework. It uses data collected from an online questionnaire completed by 1,198 respondents. We could expect that more travel products will be booked online in the future as online intelligent agents become more user-friendly and powerful, and as portable devices such as smartphones and iPads become more prevalent and versatile.

INTRODUCTION

What is known about the consumer decision making process is that the consumer has a limited capacity for processing information (Bettman, 1979). When given a choice, the consumer rarely undertakes very complex analyses of available alternatives, but rather will use simple decision heuristics. This allows them to avoid the overly burdensome task of assessing all the information available about all the alternatives in order to arrive at a choice. The consumer undertakes an external search to the extent that information now available in memory is judged to be inadequate. Additional information will be acquired until the consumer perceives any additional exertion to be too costly in terms of time or effort. Consumers do not enjoy extending a great deal of effort on decision making. Equity theory demonstrated that as more effort is spent on decision-making, consumers' satisfaction with the decision process diminishes (Oliver & Swan, 1989).

More recently, consumers use the Internet for planning purposes as well as transactional ones. Motivation is the reason for this behavior. Consumers also search the Web for information of interest to them and thereby seek some form of gratification through this search process. This planning and searching behavior applies to the travel sector as well as many other areas. Information search and plans often take place before purchases especially in the travel sector due to high levels of involvement with the product of travel and the large cost (Conyette, 2010). Motivational theory, and uses and gratifications theory well explain why travel consumers use the Internet in planning or researching their travel before purchasing or booking a transaction. What is lacking in travel literature are frameworks that track components of the complex consumers decision process and confirm the relationships of variables in the framework.

In this research a Conceptual Framework was developed showing the connection between the online searching component and booking of leisure travel products. In addition, the relationship between key variables of searching and booking is tested through logistic regression for the first time in this study. The importance of developing a framework is that it helps us understand how travelers acquire information and this gives marketers an opportunity to influence consumers' buying behavior. More information about a destination, for instance, will increase the likelihood of incidental and intentional learning by travelers

(Gursoy and McCleary, 2003). The Framework builds on knowledge of tourist's information search behavior conducted by researchers such as Schmidt and Spreng (1996), Gursoy and McCleary (2003), and Hyde (2008).

LITERATURE REVIEW

When buyers determine that the cost of making a disappointing purchase increases, they seek additional information. For higher priced items, the cost of making a disappointing purchase is higher and as a result, so are the benefits from prepurchase efforts to acquire information (Laband, 1991). Therefore, rationally, consumers' search should be increasing when the importance of the purchase increases. However, search activity for information itself costs consumers as well. Perceived cost of information search is defined as "the consumer's subjective assessment of monetary, time, physical effort, and psychological sacrifice that he or she expends searching for information" (Bettman, 1979; Schmidt & Spreng, 1996, p. 253). When the outcome of the search is potentially more beneficial consumers are likely to spend more time and effort searching.

The cost of information search for consumers is influenced in part by the accessibility of information. Accessibility is higher when consumers are aware of the availability of information and it is in a format that is easy to understand (Schmidt & Spreng, 1996). The role of online search tools for finding information, and XML in presenting the information, is therefore important.

The search for information is clearly one of the stages of the consumer purchase decision process and it has been the subject of much empirical research (Punj & Staelin, 1983; Srinivavsan & Ratchford, 1991). Consumers stop their information search efforts short of being perfectly informed. Different factors affect when they stop, the most common of which are the cost of information search, the level of consumer product knowledge, the type of purchase, and the level of consumer involvement.

It has become critical for companies to determine the types of gratifications that impel consumer use of the Internet for information search. A study of Americans shows they like using the Web as a search tool and regard the Internet as a source of information for learning and research. People recognize the Internet as a useful communications medium, and derive personal gratification from using it as a socialization venue (Stafford & Gonier, 2004).

A large percentage of Internet users have a primary goal of simplifying their lives and saving time. Forsyth, Lavoie, and McGuire (2000) called these consumers simplifiers and discovered they comprise 29 percent of Internet consumers and over 50 percent of all online transactions.

Even though the Internet has given consumers a greater amount of information, online tools have reduced consumers' search costs. These tools assist consumers in decision-making, and improve the quality of their decisions (Haubl & Trifts, 2000). Humans have limited resources for information processing despite the assistance of online tools by virtue of their limited memory, attention, or motivation, for instance (Payne, Bettman & Johnson, 1993).

In explaining consumer attitudes about online shopping and predictors of online behavior, it was discovered that there are more than demographic factors that influence the amount of money people spend online, or whether or not they buy there. Bellman, Lohse & Johnson, (1999) claimed the explanations are whether consumers like being online and whether the time they have for buying things elsewhere is limited. They also found the most significant predictor of online buying behavior is the desire to look for product information. Another predictor is what they called a wired lifestyle. A wired consumer has been on the Internet for years, uses it to send and receive email messages, likes to be the first to use the latest communication technologies, and uses the Internet at work as it improves their productivity. Because

these consumers use the Internet for many activities it is natural to expect them to use it to search for product information and to buy products.

Discretionary time was also reported to influence a person's decision to shop online. As the total number of hours worked by members of a household increases consumers have less time to search for and buy products in a traditional store. This is especially the case for dual-income households. These consumers may have used catalogs in the past but now take advantage of E-commerce sites on the Web. Bellman, Lohse & Johnson claimed consumers value the Web's ability to save them time over its cost savings capability.

Thus, it appears the behavior of consumers in an online environment is different from traditional consumer behavior. In addition, consumers are motivated in different ways and may utilize online tools in various ways to derive diverse forms of gratification.

Numerous researchers including Joines, Scherer & Scheufele (2003), Korgaonkar and Wolin (1999) suggest motivations play a greater role in Web usage than do demographics, although demographics has been demonstrated to be influential (Conyette, 2011). A classification system developed by McGuire (1974) identified categories of motives. One category most related to the area of travel planning is what McGuire termed a cognitive preservation motive or the need to categorize. People have a need to organize the vast array of information and experiences they encounter in a meaningful yet manageable way.

Furthermore, uses and gratifications theory explains why people use the media and what gratifications they seek in media use. Ko, Cho & Roberts (2004) developed a model to explain the effects of motivations and interactivity in establishing consumers' attitudes and purchase intentions. Motivations are looked upon as the antecedent conditions and the consequent conditions are viewed as gratifications. In other words, gratifications sought by consumers (the motivations for media use) and gratifications obtained (the results of media consumption). Four motivations for using the Internet were identified in that study: information, convenience, entertainment, and social interaction.

Travelers want to visualize their vacation and see what they are getting into. This is consistent with the findings of Haubl & Trifts, (2000) who report online tools assist consumers in decision-making, and improve the quality of their decisions. Also, respondents will allow the online intelligent travel decision aids (ODA) to influence them or give them ideas. This makes sense as they are the types of people who really do not organize their vacation. An interesting insight came from those travelers who organize a vacation essentially around a travel agent's recommendations. The value they see and the expectations they have for an ODA is for it to perform like a travel agent by making trip planning easier, providing suggestions, answering any question, providing one-stop shopping, etc. Bechwati and Xia (2003) found that the consumer considers an ODA an effort saver since they recognize if it were not for an ODA they would have to do the work themselves. Moreover, Haubl and Trifts (2000) described one of the key functions of electronic decision aids as that of making recommendations.

The implications for travel marketers are clear. Make navigating and searching on a website as inexpensive and time efficient as possible, and provide relevant information about a destination so that it reduces search costs (Gursoy and McCleary, 2003). Moreover, travel websites should be engaging and helpful by providing powerful intelligent tools that assist in the decision process (Conyette, 2010).

Information search and plans often take place before purchases. This was confirmed during construction of the Conceptual Framework (Conyette, 2010). While creating this Framework, participants in focus groups, interviews and case studies often raised this topic of the desire to research. Other researchers such as Hyde (2008) uncovered a similar dynamic. Hyde tested a model of pre-vacation decision-making and

demonstrated three interrelated but unique stages including information search, plans and bookings. Tourists search for travel and destination information, make a plan of the vacation, and then book components of the vacation. Hyde also makes the point that many tourism researchers use information search and vacation planning interchangeably but rarely has the relationships between the three stages been explored.

The Conceptual Framework developed in this research emerged in part from insights provided through literature and it also used qualitative research methods to refine these insights. The finding of the qualitative research is described in the following section. Thus, the Framework implies that a significant predictor of travel buying behavior is found in the search and planning behavior that often takes place before travel booking. Confirming the significance of the search and planning process through logistic regression is the aim of this research. This Framework is shown in Figure 1 of the Appendix.

METHODOLOGY

Data

Qualitative research was conducted and confirmed these explanations between researching, planning and booking travel. Focus groups revealed that participants consult the Internet, travel agents, friends and relatives for suggested destinations and then they search for good deals primarily on airfare or hotels. Sometimes travelers also engage in an extensive research or planning process. It was even suggested that women spend more time searching the Internet than men. They compare prices and check details thoroughly and then discuss the travel specifics with their partner. Personal interviews undertaken also showed that ODA could provide worry-free, planning assistance.

In case studies carried out by this researcher, respondents more likely to research and plan extensively with online and offline aids were those with a disdain for novelty and surprise. This appears to be the older respondents. The opposite seems true for younger respondents. Hyde's (2008) tour planning research confirms this idea. Hyde's paper also supports the notion that the time tourists spend consulting travel guidebooks, friends and relatives, and word-of-mouth advice increases confidence, encourages the traveler to be more independent of a fixed tour itinerary, and reduces the need for pre-vacation accommodation booking.

Following the development of the Conceptual Framework, data was collected to test for the first time components of it that deal specifically with searching and booking. In an online survey conducted by this researcher in 2008, a total of 1198 completed surveys were collected for data analysis. Data analysis was performed using Stata 10 software.

Hypothesis tests

For each of the three hypotheses, Pearson chi-square test of independence with an alpha of 0.05 between variables was firstly used to assess if there was independence between each predictor and corresponding response variable. This is followed by univariate logistic regression tests, using a level of significance of 0.05 to determine whether the independent variable in the model is significantly related to the outcome variable. Finally, models were built for each hypothesis by selecting variables for the multivariable analysis using a stepwise method to explain the predictors for the response variable of each hypothesis.

Thus, I propose: H1: Consumers who have more negative beliefs about booking with a travel agent will have more positive beliefs about online travel searching than consumers who have less negative beliefs about travel booking with an agent. The predictor variable was "beliefs about booking with travel agent" and response variable was "beliefs about online travel searching". Beliefs of booking with travel agent

included variables ‘convenient’, ‘safe’, ‘expensive’, ‘easy’, and ‘enjoyable’. Beliefs of searching with the Internet included variables ‘convenient’, ‘easy’, and ‘enjoyable’. Five 7-point semantic differential items (difficult/easy, enjoyable/unenjoyable, convenient/inconvenient, expensive/inexpensive, safe/risky for credit card use), were used to measure beliefs about booking with a travel agent. Beliefs about searching with a travel website used the first three items. These semantic differential items were used in an earlier study conducted by this researcher (Conyette, 2010).

Each belief of the predictor variable was tested for correlation with each belief of the response variable. Statistically significant associations between “beliefs about booking with travel agent” and “beliefs about online travel searching” were discovered with all variables except three. There was no correlation between ease of booking with a travel agent and ease of researching travel with the Internet. Likewise, there was no correlation between ease of booking with a travel agent and enjoyment of researching travel with the Internet. Also, there was no relationship between enjoyment of booking with a travel agent and ease of researching travel with the Internet. This implies respondents who did not enjoy researching with the Internet or found it difficult would book with a travel agent. Thus, the predictor variables having no association with the response variables were dropped from further analysis. Univariate logistic regression tests were then used. When the p -value associated with this test is less than 0.05, we reject the null hypothesis that $\beta_1 = 0$, and we conclude the independent variable contributes significantly in explaining variation in the response variable. Predictor variables of ‘difficult’ and ‘enjoyable’ booking with a travel agent were already dropped. However, predictor variables of ‘convenient’, ‘safe’ and ‘expensive’ booking with a travel agent were significantly related to the response variables and therefore were kept. Finally models were built by selecting variables for the multivariable analysis using a stepwise method to explain the predictors for the response variables. The importance of each variable included in the models was verified through an examination of the Wald test statistic. Even though numerous models for each predictor were created, the best model appears to be found by using the response variable belief ‘easy’ online travel searching, and predictor variables ‘safe’ and ‘expensive’. See Table 1. Hypothesis H_1 is partially supported with these predictor variables since interpreting odds ratios among categories of predictor variables implies that when a respondent believes booking with a travel agent is ‘expensive’ there is a greater probability their belief would be that searching travel online is easy. This matches with

Table 1: Hypothesis 1 Best Fitting Model

Belief Online Searching Easy	Odds Ratio	Std. Err.	z	P> z	[95% Conf. Interval]**

Ordered logistic regression Number of obs = 1091 LR chi2(10) = 56.31

Prob > chi2 = 0.0000 Log likelihood = -1585.6082 Pseudo R2 = 0.0174

This table shows response variables Belief Online Searching is ‘easy’ to predictors Beliefs booking with Agent is ‘safe’ & ‘expensive’. Most p -values of the predictor variables are below 0.05 indicating a good fit. The importance of each variable included in the model was verified through an examination of the Wald test statistic for each variable following ML, and a comparison of each estimated coefficient with the coefficient from the model containing only that variable.

the finding of Conyette in an earlier study where consumers who had more positive beliefs about travel agent booking were shown to have lesser intention to purchase travel online than do consumers who had less positive beliefs about travel agents (Conyette, 2010).

I propose H2: Consumers who have more positive beliefs about online travel searching will have a more positive attitude toward online travel searching than consumers who have less positive beliefs about online travel searching. The response variable is “attitude toward online travel searching” as measured by the variables ‘good’, ‘desirable’, ‘beneficial’, and ‘positive’. For a global measure of attitude, these four 7-point semantic differential items (positive/negative, good/bad, desirable/undesirable, useless/beneficial) were used also in an earlier study (Conyette, 2010). Predictor variables are “beliefs about online travel searching” as measured by the same variables used in Hypothesis 1. Each belief of the predictor variable was firstly tested for correlation with each attitude of the response variable. All variables were significantly related and thus kept. Univariate logistic regression tests were then used. All predictor variables were useful predictors and therefore kept. Finally, models were built. For each attitude all the beliefs were kept. Hypothesis H₂ is supported with predictor variables for attitude ‘beneficial’, including beliefs ‘convenient’, ‘enjoyable’ and ‘easy’. Internet searching is beneficial to respondents. See Table 2.

Ordered logistic regression Number of obs = 1105 LR chi2(18) = 452.89

Prob > chi2 = 0.0000 Log likelihood = -1514.267 Pseudo R2 = 0.1301

This table shows the response variable Attitude ‘Beneficial’ to Belief predictors. All p-values of predictor variables are below 0.05 indicating a strong fit. The importance of each variable included in the model was verified through an examination of the Wald test statistic for each variable following ML, and a comparison of each estimated coefficient with the coefficient from the model containing only that variable.

I posit that H3: Consumers who have more positive attitude about online travel searching will have a greater intention to search travel products online than consumers who have a less positive attitude toward online travel searching. The response variable is intention to search online as operationalized by the survey question “How likely is it that you will research any travel product through the Internet within the next six months?” One 7-point highly likely/highly unlikely bi-polar scale was used to determine travel researching intention. An earlier study operationalized intention to book travel online in a similar manner (Conyette, 2010). The predictor, “attitude toward online travel searching”, was measured by variables

used in hypothesis 2 above. Hypothesis H₃ is supported with all predictor variables but the best fitting model is with attitude variables ‘desirable’ and ‘beneficial’ as can be seen in Table 3.

Table 3: Hypothesis 3 Best Fitting Model

Online Searching Intention	Odds Ratio	Std. Err.	z	P> z	[95% Conf. Interval]**	
Attitude Desirable_2	1.590713	0.4403483	1.68	0.094	0.9246093	2.736688
Attitude Desirable_3	2.350163	0.7073834	2.84	0.005	1.302843	4.239396
Attitude Desirable_4	2.194053	0.6488383	2.66	0.008	1.228924	3.917143
Attitude Desirable_5	2.081828	0.5553923	2.75	0.006	1.234129	3.511797
Attitude Desirable_6	1.179741	0.2976131	0.66	0.512	0.7195386	1.934279
Attitude Desirable_7	0.7953317	0.204864	-0.89	0.374	0.4800574	1.31766
Attitude Beneficial_2	1.550731	0.2784901	2.44	0.015	1.090617	2.20496
Attitude Beneficial_3	2.307189	0.4934318	3.91	0	1.517188	3.508546
Attitude Beneficial_4	1.968677	0.5173384	2.58	0.01	1.176229	3.295015
Attitude Beneficial_5	2.941624	0.8822161	3.6	0	1.6342	5.295039
Attitude Beneficial_6	3.54075	1.167213	3.84	0	1.855647	6.756085
Attitude Beneficial_7	2.028112	0.8219241	1.74	0.081	0.916493	4.488019
/cut1	1.416436	0.2189298	0.9873419	1.845531		
/cut2	2.598569	0.2298768	2.148019	3.04912		

Ordered logistic regression Number of obs = 1107 LR chi2(12) = 94.21

Prob > chi2 = 0.0000 Log likelihood = -924.44245 Pseudo R2 = 0.0485

This table shows the response variable Online Searching Intention to Attitude predictors. Most p-values of the predictor variables are below 0.05 indicating a good fit. The importance of each variable included in the model was verified through an examination of the Wald test statistic for each variable following ML, and a comparison of each estimated coefficient with the coefficient from the model containing only that variable.

RESULTS AND DISCUSSIONS

Support for all three hypotheses of the Framework implies that a significant predictor of travel buying behavior is dependent on search and planning behavior that often occurs before travel booking. Internet searching is perceived to be beneficial and desirable by respondents. Logistic regression confirms the significance of the search and planning process in this study as it did for other elements of the Framework that were tested in an earlier study (Conyette, 1010). All elements of the Framework seem to be well conceived. Beliefs about booking with travel agents, travel websites and searching travel on the Web, attitudes towards online travel searching and booking, social support, social acceptance, and prior experience are all determinants that ultimately affect online travel booking intention.

People who do not enjoy researching with the Internet or find it difficult would book with a travel agent. However, those with favourable beliefs and attitudes about online travel searching will more likely search for travel products online and in turn will probably book travel online. Furthermore, given the availability of numerous advanced tools, mobile software, databases, and apps for travelers such as Google Goggles, Wikitude's - Mobile Augmented Reality Guide, Poynt, Urbanspoon, and Yelp we can expect that travelers will become more and more comfortable using technology and the Web, and the products will become more user-friendly. Consumers are aware of how the Internet can empower and engage them and they are not willing to give this up even if travel agents offer them good personal service. Consequently, one could predict that the inclination to depend on and use the Internet will grow. Consumers will use their portable devices in greater numbers to search and book travel products using the Web.

Numerous AR applications built for smartphones are currently on the market using Google's Android operating system. A special browser app such as Wikitude World Browser runs on Android phones and iPhones. Wikitude.org has thousands of entries for frequently visited tourist locations in London, Paris and other major cities, points of interest (POI) and location-specific, hyperlinked media content which can be viewed on the Wikitude World Browser. Furthermore, companies like Sony are developing systems that a person can wear like sunglasses that will accomplish the same thing (Casio, 2009). These devices

will change sightseeing and touring activities of tourists. Pointing the device on a building can tell you what you are looking at. An image on the phone's screen becomes layered with things such as restaurant reviews of restaurants shown on the street, or directions to the nearest subway stop since the device recognizes its location by combining GPS technology, the smartphone's internal compass and the camera viewfinder. Therefore, the device acts as a guidebook. Numerous researchers predicted this type of human interaction with smart devices, computers or robots (Drascic, Grodski, et al., 1993) and now we are entering an era where this interaction is becoming commonplace.

CONCLUSION

A Conceptual Framework was developed showing the connection between online planning and booking of leisure travel products and for the first time the relationship between these variables is tested through logistic regression. This conception of the decision process is an attempt to incorporate the act of searching that sometimes precedes purchasing of leisure travel products. The Framework tracks components of the complex consumer decision process and confirms the significance of searching and planning before travel booking takes place. Logistic regression of selected variables in the Framework confirms that consumers plan then book travel and that beliefs and attitudes influence intention to book travel online. Furthermore, beliefs about travel agents affect beliefs and attitudes about online searching, just as it does online booking intention as demonstrated in an earlier study (Conyette, 2011).

When people search the Internet, they use search engines to view specific areas of interest. In the process of searching for interesting information, a user may encounter certain stimuli that activate or create a need. They also use the Internet to help plan travel itineraries and expenditures. Furthermore, the Internet is often used to book or purchase various travel products. These activities take place before travel begins but also while travel is in progress. We could expect that as online intelligent agents become more user-friendly and powerful, and as portable devices such as smartphones, iPads, etc. become more popular, consumers of travel products would be more likely to use these devices during their travel. In fact, for travelers, having such a portable communications device is ideal since they incorporate access to the Web, high quality cameras, and enabling applications such as online computational photography.

Limitations

Survey respondents expressed their intention to search travel online but these do not necessarily reflect enduring behavioral patterns of subjects. The survey instrument was administered on the Internet. Subjects were referred to the website which included the survey and appropriate instructions. Every respondent saw the same questionnaire and had the same instructions to guide them. Although the survey was pretested it is difficult to determine if participants fully understood the questions asked. In addition, consumers without much Internet experience most likely did not complete the survey.

THE QUEST FOR SUSTAINABLE BUSINESS TOURISM: AN EXAMINATION OF ITS ECONOMIC VIABILITY IN TRINIDAD

Narendra Ramgulam, University of the West Indies
Koshina Raghunandan, Mohammed, University of the West Indies
Moolchand Raghunandan, University of the West Indies

ABSTRACT

Tourism is one of the fastest growing sectors in the world and it adds to increased employment and revenue generation; provides continuous valuable foreign exchange; contributes to the international trade among countries; and it endorses diversification. It brings economic value, and once managed well, it supports economic development for many countries. As such, different countries promote different forms of tourism products. Business Tourism is on the front burner for some countries as it adds significant economic value to their tourism and overall Gross Domestic Product. The aim of this paper is to provide an understanding of business tourism and how it adds to sustainability and fosters economic development for countries. The paper will discuss the concept of business tourism and how it can become economically sustainable. It examines the viability of business tourism in Trinidad and makes recommendations for the future of this niche market. Furthermore, a brief assessment of the United Kingdom's business tourism industry will be presented and its policies to determine what, if any, refinements of the UK's strategies can be made to accommodate Trinidad's unique situation in the quest for sustainable business tourism. The research has revealed that business tourism is economically viable and should be pursued as a micro sector for diversifying the Trinidad and Tobago economy. The findings also embrace the notion of sustainability as a way forward.

KEYWORDS: Business tourism; Sustainable Tourism Development; Butler's (1980) TALC Model; Meetings, Incentives, Conventions and Events (MICE); Economic Sustainability; Trinidad.

INTRODUCTION

Tourism is one of the fastest growing sectors in the world (WTTC 2009). The actual and projected statistics put forward by the WTO are encouraging for countries to diversify their economy to facilitate tourism development. However, this micro sector is an extremely diverse one and differs from country to country. Each country is uniquely different and their tourism strategies and plans would depend on what resources are available. The Latin American Studies Organization and by Discover Magazine (2010) describe Trinidad as the "Little America" and the "economic tiger" of the Caribbean. This country boasts of having the infrastructure, amenities and facilities all geared toward the business traveler and over the years, it has become the main hub for international business in the Caribbean.

One of Trinidad's appealing features is that, unlike many of its neighboring islands, it offers business tourists direct flights to many international destinations including the major metropolitan cities. Business tourism has the potential to stimulate the economy through the continuous flow of foreign exchange, create job opportunities, encourage infrastructural and social development, establish linkages with other industries and play a key role in diversifying Trinidad's oil based economy. However, despite all its charming features, it also has negative economic impacts, as this sector is capable of influencing inflation, leading to excessive demand for resources, fostering unbalanced economic development and exploitation, bringing about unwanted spill off sectors, all of which collectively increases the vulnerability of

countries. Against this background, countries seeking to employ business tourism as a diversification avenue to escape their dependency syndromes need to be very selective in identifying their developmental goals. These goals should foster an energetic business climate and attract investors. Note worthy, due consideration should be given to the sustainability and the impact this form of development will have on spill-off sectors. According to Pattullo 1996; Mowforth and Munt 1998; Ateljevic 2007; Elliott 1999; Gmelch 2004; Hall *et al* 1999; Inskip 1991 and Jayawardena 2005, business tourism apart from being a fragile industry is seen as a double edged sword that has potential for positive and negative impacts on a country's development.

LITERATURE REVIEW

This section highlights the various work, views and studies in the areas of business tourism, sustainability, business tourism in Trinidad and the United Kingdom including the latter's ten-point plan.

Business Tourism

Business tourism as described by the World Travel and Tourism Council (WTTC) is referred to as the Meetings, Incentives, Conventions, and Events (MICE) market and represents a potential source of revenue, employment and international trade. 'Sustainable' and 'sustainability' are the buzz words used today. The concept of sustainable tourism is being embraced as a best practice by many countries around the world. Trinidad and Tobago is no different and in its National Policy Document; the blueprint for tourism, it has embraced the notion of sustainability as a way forward. According to Phelan *et al* (2009), business tourism goes beyond work purposes, sports tournaments, festivals, concerts etcetera. It incorporates all activities associated with the MICE industry. Note that, this form of tourism has some peculiarities as it caters for the affluence and the professional (Jafari 2000). In this regard, business tourism caters to those of a high-income bracket and according to the Business Tourism Partnership (2003); business tourism is at the high quality and high yield end of the tourism spectrum.

Business tourism is unique in itself and it reinforces Trinidad as a preferred destination because this country is the home to many industries and it has the necessary service infrastructure to provide for this market niche. It compliments other sectors such as the leisure industry and encourages investments in business tourism facilities, which can lead to the regeneration of other areas (urban and inner city). For example, there were investments in such facilities in both Europe and the USA, which led to the regeneration of the economies (Hankinson 2005). In the local context, this country has the resources and capacity to cater to the needs of the business traveler and attract volumes of business travelers.

Lawson (1982) articulated that several factors contributed to the growth of business tourism. These include increased technological advancements in air travel, increased propensity to travel due to increased education, economic growth, rise in disposable income, and expansion of multinational companies, rapid development and growth in professional associations. Other factors are technology at the destination; infrastructure, image and funding availability determine the location of certain business events such as conventions/conferences (McCartney 2008). Swarbrooke and Horner (2001) further segmented these contributory factors into demand and supply side. Overall, the increasing use of the internet and other forms of technology are providing organizations, individuals and businesses with innovative facilities to network, interface, redevelop the tourism product and encourage investment in tourism (McCartney 2008; Buhalis and Law 2008). The increasing use of technology has also provided companies with new ways of cutting business costs notwithstanding, the personalization of doing business.

While the above factors contribute to the growth of this niche market, challenges have marred its success and progress including the effects of September 11th; economic downturn; and increased travel cost. Air

travel today has many rigorous checkpoints and restrictions, where travelling is sometimes seen as an uncomfortable experience (Business Travel News 2001).

Given these challenges, not all countries and companies experience these at the same time. For example, some emerging economies such as India, China and Brazil continue to show progress, while others are encountering recessions. While recessions have negative effects on countries, governments should put in place precautionary measures to protect, sustain and preserve the economic resources. Sustainability and sustainable development are measures taken by governments to meet the needs of the present without compromising the ability of future generations to meet their own needs.

Sustainable Tourism Development

Sustainable tourism development builds upon the premise of sustainability. It takes into consideration the resource base that currently exists and the utilization of resources in a manner that the resource base of future generations are not impaired (Hall and Lew: 1999). Further, it promotes fairness and equality and aims to create win-win situations with the various stakeholders involved in the tourism process (Jurovski 2002). Sustainability is built on the premise that three pillars need to be satisfied. These three pillars are the natural environment (eco-friendly), the economy (financial benefits), and socio-cultural benefits (create employment opportunities and preserve culture). As such, prudent management of the three pillars would offer a positive way forward for development since it seeks the interest of all involved (Harris *et al* 2002). However, the reality of the situation is that these pillars do not always work in harmony. Managers and stakeholders have their own interest (agency issues) and therefore it would be difficult to manage certain relationships (Elliott: 1999). One potential solution for the proper functioning of a business tourism niche is to bring the relevant stakeholders together so that they could develop a proper policy for the implementation and execution of business tourism. Tosun (2006) and Miller and Twining-Ward (2005), articulated that tourism planning has evolved and in the spirit of compromises, all stakeholders benefit (Dewhurst and Thomas: 2003).

Therefore, it is necessary to gain a holistic understanding of tourism before making comprehensive decisions. Within the tourism industry many businesses are intertwined and connected, what affects one segment will more than likely have a spill off on other segments as well (Lemmetynen and Go: 2009). Business Tourism Partnership (2003) argues that business tourism is sustainable. It offers higher benefit with fewer environmental negative impacts than mass leisure tourism. Notwithstanding the above, business tourism can provide long term benefits if managed properly; resulting in sustained economic, social and environmental benefits over time. The main benefits of business tourism for destinations, (adopted from Swarbrooke and Horner 2001: 09) are infrastructure developments, viability of leisure facilities (shops), create opportunities for local businesses, and continuous flow of foreign exchange since business travelers tend to visit in the off-peak seasons.

Business Tourism in Trinidad and Tobago

The twin island republic of Trinidad and Tobago is the “Little America” in the Caribbean. It has a population of 1.3 million people and is one of the most developed economies in this region. It is fast becoming the economic hub of the region with many business type hotels and facilities. The country boasts of natural attractions, historical sites, and a diverse culture with various festivals, food and warm hospitable people. Statistically, the tourism sector directly accounts for about 10.6% of the Gross Domestic Product (GDP) (WTTC, 2009) and this figure is projected to rise given the government’s current diversification developmental plan. This sector provides the best opportunities for inter-sector linkages to curb many problems such as revenue leakages via high spending on imports, and curbing the problem of high food prices in society. In fact, business tourism been clearly articulated as a possible diversification strategy in the National Tourism Policy document of Trinidad and Tobago.

Over the years, studies have revealed that people prefer to do business in Trinidad. Notwithstanding, the value of the TT dollar to the US dollar (\$1 US: \$6 TT), this country offers favorable terms of trade, has the necessary financial infrastructure, business tourism facilities, information technology and human capital to facilitate international business. Theoretically, according to Butler's model (1980), Trinidad displays symptoms of being at the Development stage of the Tourist Area Life Cycle. At the development stage, visitor numbers are climbing and the destination has to put measures, facilities and amenities in place to cater to the increased arrival of visitors. This is a phase that requires proper management (Douglas 1997; Destination Recovery 2010; and Cooper *et al* 2005).

More so, business tourism has growth potential in terms of both diversification and economic impact on the GDP. WTTC (2009) revealed that business tourism grew steadily from 2004 to 2008. The US\$ in millions climbed from 159.0 in 2004, to 200.9 in the year 2008 and it is projected to increase further to 401.6 by the year 2019. Data released from the Trinidad and Tobago Central Statistical Office (CSO) indicates that while the purposes of leisure remain high at 43%, it is not as high yielding as business tourism that accounts for 22% of the arrivals, which contributes more significantly to GDP (WTTC 2009). CSO statistics also reveal that for the period 2002 to 2008, the numbers for the business tourists increased from 66,213 to 83,998. This increase in trend shows that the country has great potential to diversify in the area of business tourism as it offers immense scope for growth and viability. It also demonstrates there is capacity for sustainability and sustainable development should the country decide to vigorously pursue this area of development.

The United Kingdom's Business Tourism Industry

The United Kingdom's (UK) tourism industry is ranked UK's fifth largest industry in 2007 and it is a profitable *cash cow* that contributes significantly to its Gross Domestic Product (GDP). In 2007, the industry raked in roughly £86 and £19 billion in total revenue and foreign currency respectively. The benefits derived from this industry contributed to 8.2% of GDP in 2007, of which the direct benefits represented 3.7%. The country is an international brand with fascinating tourism features – historical landmarks, cultural roots, its geographical location and quality infrastructure and attractions (for sporting activities, conferences, art, theatre etc) among others. As a result, the UK consistently ranks sixth or seventh in the list of top destinations in the world.

Given the rise of new and mesmerizing destinations like Dubai, this country's industry also faces obstacles including adverse market/economic conditions (global recession and credit crunch), the perception as being a posh and pricey destination, increased barrier to entry (visa requirement), inability of the Small and Medium Enterprises (which represent 80% of the 200,000 plus businesses in the tourism industry) to invest heavily in the industry, collapsing supporting infrastructure (transport in particular) and higher tourist taxation (increases in Air Passenger Duty and charges associated with visas). These challenges are making a dent in the success of the UK's tourism industry since the country has begun to lose its competitive edge (its share of international tourist declined from 6.5% in 1980 to 3.8% in 2005).

In relation to Butler's model, our indicators reveal that the UK's business tourism industry is at the Consolidation stage of the life cycle. Key indicators employed were rising visitor numbers and already established facilities/amenities (airport, hotels and low cost carriers) that cater to a diversified range of tourists (culture, sport, shopping etc.). As consistent with Butler's theory which recommends planning and prudent management to facilitate a smooth transition into a rejuvenated niche market, the UK has commenced on a strategy for taking their industry forward (2011 Tourism Plan).

Their tourism plan examines rejuvenating downstream tourism niches by hinting of investments in these niches. There is also an indication of planning for a declining stage (knowledge management, succession

planning, investments in other sectors, strategic market research) which signifies that the declining stage is not too far off and they plan to put measures in place to restart a new rejuvenated product when they get to a stagnation point where visitor numbers just peak off. The ten-point plan devised aid the country in its sustained development of the entire tourism industry is as follows:

- Consolidate market position (traditional and emerging)
- Engage in product development and marketing strategies
- Advancements in ICTs (internet platform)
- Creation of stakeholder partnerships and relevant performance measures (for accountability)
- Formulate policy through industry engagements
- Creation of cross-ministerial groups
- Economic planning in public policy (due consideration to tourism industry)
- Revamping the functions of VisitBritain (National Tourism Agency) to address performance and value
- Securing investment initiatives from private and public sector
- Create cutting edge marketing campaigns and solicit government support

METHODOLOGY

Data

Data was primarily collected through the administration of a structured questionnaire to seven key local industry professionals. The data collected was tested using thematic analysis. A qualitative research methodology was selected to gather exploratory data because qualitative research offers empirical information, deep insight and richness of detail (Neuman 2006; Minichiello and Kottler 2009; Willis 2007; Punch 2005; and Outhwaite and Turner 2007). The paper will also shed light on the various strategies employed by the United Kingdom and discuss their applicability to the business tourism niche in Trinidad as a means of achieving economic sustainability.

The Instrument

A structured questionnaire was devised and self-administered, the formulation of which entailed adapting relevant questions found in the literature (Cooper *et al* 2005 and Duval 2004) with a view to answering three research questions:

- Is business tourism a viable market in Trinidad?
- Is business tourism economically sustainable?
- What are some strategies and recommendations to drive the business tourism niche forward?

The questionnaire comprised of three sections with all open-ended questions. The first section asked questions pertaining to business tourism and its importance. The second section raised questions relating

to the economic sustainability of business tourism and the pros and cons of it. Finally, the third section solicited responses on issues pertaining to strategies and recommendations regarding the way forward for business tourism in Trinidad.

RESULTS AND DISCUSSION

This section of the paper presents the responses from the seven respondents under three core themes: Business Tourism, Economic sustainability of business tourism and Future strategy and recommendations.

Business Tourism

Consistent with the literature reviewed, all respondents agreed that increased technological advancements in air travel, economic growth, infrastructure, increased education, and development of professional associations facilitated the growth of this niche market (Lawson 1982; McCartney 2008; Swarbrooke and Horner 2001; and Buhalis and Law 2008). However one respondent stated that due to the relaxation of trade barriers, it is now easier to travel and to do business. Through technological advancements business tourists can now reach their destination faster and 'hassle free' by engaging in online ticketing and check-in systems at a click of a button in the comfort of their offices. According to one of the respondents, *"Business tourists don't need to walk with much cash anymore... all they need is their credit cards"*.

Three out of the seven respondents reported that the business tourism niche was a significant market to tap into. They claimed that some factors which make Trinidad a budding tourism destination are: geographic location; existing industries; infrastructure and flights; accommodation and facilities; uniqueness; experience of hosting conferences before; English speaking; and economic pricing. One interviewee stated, *"Business tourists tend to prefer the countries which speak English and follow the English legal system of doing business"*. Another interviewee expressed the sentiment, *"...we are certainly on par with the rest of the world..."* The uniqueness of Trinidad as a business tourism destination was emphasized. Trinidad has the propensity to attract people to return and do more business because it offers the sun, sea, sand, cultural attractions, gastronomic treats, and warm hospitality. Economically these are good for the country.

Five respondents claimed that Trinidad has the experience of hosting mega events and the skills in handling the Meetings, Incentives, Conventions and Events (MICE) market affairs. For example, this country hosted events such as; Caribbean Heads of Government Meeting (CHOGM), The Commonwealth Heads of Government Meeting, The 5th Summit of the Americas and events such as Miss Universe and the Cricket World Cup, and this augers well for Trinidad's main business tourism source markets (the US, UK and Canada).

Economic Sustainability of Business Tourism

Five out of the seven stakeholders revealed that business tourists pay higher rates and the country generates more revenue to the Gross Domestic Product (GDP). They claim that business tourism is important, as it brings in a continuous stream of revenue generation throughout the year, and it adds stability to the economy. According to one respondent, *"Business tourism is not seasonal and it adds value throughout the year...it creates revenue year-round"*.

Six out of the seven respondents agreed that, *"Port of Spain has become a financial hub and offers much support services to this market"*. One interviewee stated that the exchange rate places the Trinidad destination as being more competitive when compared to other countries. Another respondent claimed that, *"... around 80% of the tourism GDP is as a result of the Meetings, Incentives, Conventions and*

Events (MICE) market". He further stated that the tourism contribution to the GDP of the Trinidad and Tobago economy is about 10%, of which roughly 8% of this amount is related to business tourism in Trinidad. This statistic was well supported by four out of the seven respondents.

One hundred percent of the respondents agreed that business tourism can generate much needed foreign exchange. One respondent stated that, "*The indirect benefits of tourism should not be ignored, and the huge ripple impact created in the economy*". Additionally, six out of the seven respondents stated that, business tourists spend more money than any other type of traveler, and this means higher value being created. It was also reported that five of the seven stakeholders pointed out that business tourists are not price sensitive because the company pays for their trip.

However, two respondents claimed that business travelers usually return as leisure travelers to the destination. According one of the respondents, "*...There is a statistic which says that 40% of business tourists return to the destination at a later date for leisure purposes*". The other respondent agreed that business travelers offer an opportunity to double market and encourage business travelers to return later as leisure travelers. All seven respondents emphasized the impacts of business tourism on the economy. For example, the economy gains via job creation, and there is a multiplier effect as many spill-off jobs are created (taxi drivers, tour guides, entertainers, decorators and many others).

Three of the seven stakeholders recognized that by placing too much emphasis on this niche market will result in a dependency syndrome. They also stated that any recession which may occur can affect this source of revenue and the GDP of a country. One interviewee declared that, "*The price of some services can be price sensitive (economically high prices) for the business tourism sector especially in the location of such businesses*". Four of the interviewees indicated that business tourism can be more contained in one area than other forms of tourism. In this case, economic development is somewhat limited only to those areas where business tourism activity takes place at the disadvantage of other areas in a country. On the other hand, other forms of tourism such as eco tourism results in a more balanced economic development because there is a revenue trickling effect across the country.

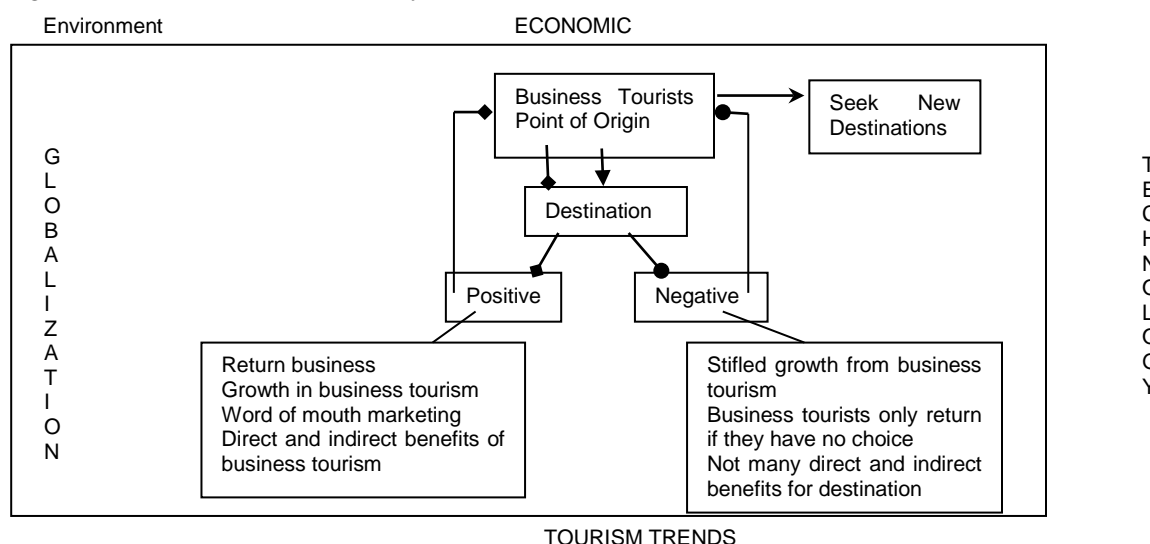

Additionally it was revealed by six interviewees that business tourists have a preset agenda and this can hamper the trickle-down effect. Time is of essence and in most instances their trips are planned, associates are appointed as escorts and they feel more secured generally. According to one respondent, "*...business travelers have their trip planned prior to travel... they know what they are going to do when! And an associate is always in touch with them—taking them where they need to go.*"

Strategy and Future Recommendations

Notwithstanding the existence of a Policy document (Trinidad and Tobago tourism policy) and a master plan (Vision 2020), four respondents were very vocal that there should be a strategy for sustainable business tourism in Trinidad. They claimed that such a document should be well ventilated and suggestions and recommendations from all stakeholders should be incorporated as the way forward. It was also suggested that there are skilled professionals who have the capacity and ability to inform this policy document. What is needed is more coordination among the key stakeholders involved to move the business tourism niche forward. The respondents shared the view that a strategy for a public awareness drive is necessary. They claimed that this can be done through education and proper communication so that even the 'common' man on the street knows that there are benefits to be derived from this industry. Communication has the ability to shape behavior and once people understand how they can benefit, they will buy-in and support such endeavors. Respondents support the propensity of resource pooling as it affords cost effectiveness, diversification and promotes efficiency and effectiveness in business tourism.

It was also mooted that benchmarking should be pursued vigorously to bring the tourism products in line with international standards. Such a focus will allow citizens to understand how successful companies compete. Cost of quality measures should be employed as it places emphasis on Total Quality Management (TQM). Quality should be instilled as part of an organization’s culture as it allows for empowerment of employees, leadership, quality training, the pursuance of quality awards and the eagerness to meet and exceed customer expectations. Arising out of our research, a framework is presented which speaks to a quality service model that allows and showcases the importance of creating a positive service experience, which will drive business tourism as the way forward. Given the very nature of business tourism and its fragility, the strategic plan should focus on sustainability and sustainable tourism development if this sector is selected as one of the diversification efforts to move the country forward. All respondents agreed that business tourism in Trinidad was sustainable, and given their ideologies, Figure 1 was constructed.

Figure 1: Business Tourism Quality Service Model

This figure presents a quality service model that demonstrates a special relationship exists between business travelers and their host destinations. If the experience is a positive outcome then business travelers will return. On the other hand, if the experience is a negative one then there will be fallout and this will have trickledown effects on the business tourism travel pattern.

Refining the United Kingdom’s Business Tourism Strategies to accommodate Trinidad

The United Kingdom (UK) being at the consolidation stage implies that they would have passed the development stage where Trinidad is currently positioned. Therefore their strategies can be examined in light of Trinidad’s Meetings, Incentives, Conventions and Events (MICE) market and can be possibly molded into bespoke strategies and adopted in Trinidad to gain a competitive advantage. It is important to note that the UK’s plan did not focus on Business Tourism alone; instead it encompasses their tourism market holistically and addresses strategies to drive the entire sector forward. Therefore, the strategies which follow will have to be tailored to suit the Trinidad’s MICE market. These strategies are identified in Table 1.

Table 1: UK Tourism Strategies and its Adoption by Trinidad

UK Tourism Strategies	Potential Adopted Strategies for Trinidad
Consolidate market position (traditional and emerging) by engaging in product development and cutting edge marketing strategies	The Caribbean on a whole could consolidate its market position utilizing institutional relationships with other islands and regional bodies such as CSME (Caribbean Single Market and Economy), and the CTO (Caribbean Tourism Organization) to get more mileage via advertising and destination awareness. Just as the UK is promoting its various countries like England, Scotland, Wales and Northern Ireland, Caricom can promote specialty products in the region, for example, Dominica as eco tourism, Barbados as leisure tourism, Guyana as soft adventure, and Trinidad as business tourism.
Solicit government support and timely feedback	In Trinidad's context more aggressive marketing can be done to enable business tourism to reach a wider catchment area. The TTCB (Trinidad and Tobago Convention Bureau) was set up in 2009 with the specific intention to market and facilitate this business tourism market. The communication channel between government and the business tourism industry should be improved so that action can be taken faster to remedy any negative impacts and to speed up decision making. The end result would be meaningful results to business tourism.
Creation of stakeholder partnerships and relevant performance measures (for accountability)	A stakeholder approach (multi-stakeholder collaboration as identified in the National Tourism Policy Document) can be used to get buy-in and support and have everyone pulling in the same direction. Partnerships with international professional associations should be encouraged so that members of local associations can gain international exposure and experience.
Advancements in ICTs (internet platform)	Building upon strong information communication technology can be an advantage to not only build destination awareness but to attract investors by showcasing what resources Trinidad has to cater to the MICE niche. Using ICTs will promote a virtual experience and this will: maximize consumer reach; provide a better, more engaging customer experience; and provide a techno savvy platform which will be more eye catching and appealing than other countries in the region. Business persons are attracted to technology, internet, destinations which offer convenience in business and therefore Trinidad should position itself accordingly for this market.
Formulate policy through industry engagements	Future policies should be created by engaging industry stakeholders. Even though this process may be painstaking, the outcome would be a collaborative and holistic policy where everyone buys-in to a common goal and takes the industry forward.

This table identifies the relevant tourism strategies employed by the UK and possible strategies that can be adopted by Trinidad in its quest for sustainable business tourism.

CONCLUSION

The global travel and tourism industry, despite being battered by shock waves (global economic downturn, epidemics, peculiar climate events, unpredictable oil prices among others), has proved that it is a force to be reckoned with given its resilient nature. Specifically, Trinidad can gain immensely if the business tourism option is pursued vigorously. All respondents agreed that the diversification into business tourism was economically sustainable and it offers one of the best linkages to other sectors. The challenges articulated are not insurmountable and with collaboration from the key stakeholders there exists a potential for emerging economies to gain developed status. Government must support and partner with industry stakeholders to effectively manage the business tourism market in Trinidad. Trinidad should also consider implementing the refined strategies identified in this paper, which have been tweaked from UK's ten-point plan, in its quest for sustainable business tourism. This study brought forth an exploratory understanding of where this niche is positioned presently and showcases that business tourism can be a valuable market to tap into.

Limitations

Like other studies, this exploratory research work has some limitations. For example, the sample size examined is small and one should be very careful when generalizing. Another limitation is that this study did not examine the environmental and socio-cultural impact of business tourism. Cost and time were also constraints when this study was undertaken. Additionally, the results and findings were somewhat restricted given that the literature search found little empirical work on business tourism in Trinidad.

ABSTRACT

The aim of this paper is to provide an understanding of business tourism and its contribution to environmental sustainability. This paper discusses the concept of business tourism and captures the environmental impact of this niche market. It examines the viability of business tourism as it relates to environmental sustainability in Trinidad and makes recommendations, which includes policy propositions for the future. Additionally, an examination of New Zealand's environmental strategies are presented to determine whether Trinidad can espouse these and embrace environmental sustainability in its business tourism industry. From this qualitative study utilizing a thematic analysis, it was determined, that business tourism was environmentally sustainable and should be pursued as a micro sector for diversifying the Trinidad and Tobago economy. The findings also revealed that there are potential benefits when countries actively pursue business tourism that is in harmony with environmentally friendly practices. It also embraces the notion of sustainability as a way forward and proposes an environmentally friendly happiness valuation model for the way forward.

KEYWORDS: Business tourism; MICE (Meetings, Incentives, Conventions and Events); Environmental; Sustainability; Happiness; Trinidad; Sustainable Tourism Development Model.

INTRODUCTION

Tourism is one of the fastest growing sectors in the world and it contributes to economic, socio-cultural and environmental benefits to many countries (WTTC 2009; WTO 2012; Cooper *et al* 2005; Swarbrooke and Horner 2001; and Ritchie and Crouch 2003). It brings economic value in the form of revenue generation, continuous foreign exchange earnings and is a means for diversifying the economy. Socio-culturally, tourism provides employment opportunities, it allows the local culture to gain wider acceptance and leads to cross cultural exchanges with other countries. The natural environment can also benefit from tourism in the form of green taxes, the induction of environmentally friendly practices by tourism facilities and beautification drives, which promote a level of aestheticism and happiness.

Tourism represents a panacea to sustainable development for many countries. As such, different countries promote different forms of tourism products. Business Tourism or the MICE market (Meetings, Incentive, Conferences and Events) is one such niche market and it is on the front burner for some countries as it adds significant economic value to the tourism Gross Domestic Product (GDP). While this option is a viable one pursued as part of sustainable development strategy, key stakeholders have continuously lobbied that such development should not be pursued at the expense of the natural environment. The natural environment is of paramount importance in the business milieu today. Companies and business tourism facilities are being encouraged to follow sound environmental practices when catering to the business tourism market, which would result in sustainable environmentally friendly business tourism. While this may be challenging to achieve, it can be done. New Zealand is a good example of a country that has developed sound environmental policies and practices built into its business

tourism product. This has made the industry quite successful and it gives justification as to its use in this paper as a benchmark for assessing Trinidad's MICE market.

LITERATURE REVIEW

This section examines the various views and studies in the area of business tourism, sustainability, Trinidad's Meetings, Incentives, Conventions and Events (MICE) market and environmental strategies employed by New Zealand.

Business Tourism

According to Phelan *et al* (2009), business tourism goes beyond work purposes, sports tournaments, festivals, concerts etcetera. It incorporates all activities associated with the Meetings, Incentives, Conventions and Events (MICE) industry and it caters for the affluence and the professional (Lawson 1982; Jafari 2000 and Swarbrooke and Horner 2001). In this regard, business tourism caters to those of a high-income bracket and according to the Business Tourism Partnership (2003), business tourism is at the high quality and high yield end of the tourism spectrum. Consequently, business travellers pay more for services (travel first class, stay at 5-star hotels, tip heavily) and they indirectly pay higher taxes which can then be used to fund environmental or social programs so that the host country benefits. In addition, they are more environmentally sensitive, willing to support and buy into environmentally conscious goods and services, promote Corporate Social Responsibility (CSR) initiatives and engage in greening projects. Generally, business tourism adds less to environmental degradation when compared to the leisure cruise market (Tourism Concern 2012). In this regard, business tourism can be considered more sustainable than other forms of tourism.

Sustainable Tourism: Sustainable tourism development builds upon the premise of sustainability. It takes into consideration the resource base that currently exists and the utilization of resources in a manner that the resource base of future generations are not impaired (Hall and Lew: 1999). Further, it promotes fairness and equality and aims to create win-win situations with the various stakeholders involved in the tourism process (Jurowski 2002). Sustainability is built on the premise that three pillars need to be satisfied (Maculay Institute 2006). These three pillars are the natural environment (eco-friendly), the economy (financial benefits), and socio-cultural benefits (create employment opportunities and preserve culture). Business tourism can be sustainable and could bring real benefits if the three underlying pillars of sustainability work in harmony. However, the reality of the situation is that there are three pillars to satisfy with various stakeholders and behavioural reactions may not agree. Managers and stakeholders have their own interest (agency issues) and therefore it could be difficult to manage certain relationships (Elliott 1999; and Reichel and Haber 2005). One potential solution to the proper functioning of a business tourism niche is to bring the relevant stakeholders together so that they could develop a proper policy for the implementation and execution of business tourism. Tosun (2006) and Miller and Twining-Ward (2005), articulated that tourism planning has evolved and in the spirit of compromises, all stakeholders benefit (Dewhurst and Thomas: 2003).

Mair and Jago (2010) claimed that a number of stakeholders must take steps to reduce their environmental footprint. For example, in 2008, New Melbourne Convention and Exhibition Centre, was the first convention centre in the world to be awarded a six-star green star rating by the Green Building Council of Australia. The greening of business tourism practices are catching on quickly, in the form of changes to products, processes and policies. With regard to Trinidad, business tourism can be sustainable and there are prospects for future development (Tao and Wall: 2009). The infrastructure, geographical location, main target market access via dependable airlift, technology, people resources, environmental practices, aesthetics and sound banking systems all give due consideration and weight for the business tourism niche to fit into Trinidad's existing system.

Trinidad's Mice Market

The twin island Republic of Trinidad and Tobago is located approximately ten kilometres north of the South American continent. It gains significant wealth from oil and natural gas. The country has a population of 1.3 million people and is one of the most developed economies in this region. It is fast becoming the economic hub of the region with many business type hotels and facilities. The country boasts of natural attractions, historical sites, a diverse culture with various festivals (Carnival, Divali, Parang etc.), food and warm hospitable people. For example, the country has delicate eco-systems such as mangroves that are vibrant but also vulnerable to destruction; and is rich in biodiversity (habitat to numerous plant and animal species). Statistically, the tourism sector accounts for about 10.6% of the Gross Domestic Product (WTTC, 2009) and this figure is projected to rise given the government's current diversification developmental plan. This sector provides the best opportunities for inter-sector linkages to curb many problems such as revenue leakages via high spending on imports, and high food prices in society. In fact, tourism has been articulated as a strategy for diversification in the National Tourism Policy document of Trinidad and Tobago. Locally, the government introduced a tax on the sales earned by companies, which goes to a green fund, and utilized for funding environmental efforts.

Since going green has become a mantra and buzzword, many hotels have in fact gone green with their practices (Scott and Becken: 2010). The instillation of energy efficient light bulbs, sensor taps in the washrooms, the use of photovoltaic systems to heat water, limited use of plastics, encouraging the reusing of towels and other environmentally friendly practices have come on stream and are quite popular (Mair and Jago 2010). Some hotels are also promoting the conservation of resources given the general overuse of water resources in swimming pools, golf courses and personal use of water and energy by tourists.

Organizations in Trinidad & Tobago have also proactively responded by adopting voluntary initiatives to manage their environmental responsibilities and ensure that policies, procedures and practices conform to the entity's environmental targets and objectives. Specifically, multinational companies that have subsidiary operations in Trinidad, such as BP, Hilton and Hyatt are protecting their global customer image and value by ensuring that Corporate Social Responsibility initiatives and more in particular their environmental efforts are adopted by their subsidiaries.

The main challenge that Trinidad and Tobago faces as a country whose economy is heavily reliant on hydrocarbon exploitation is finding a means whereby to reduce emissions without harming favourable economic growth. Additionally, most companies in Trinidad and Tobago have not come to the realization that environmental accounting and the concept of "going green" makes good business sense. This may be explained by the hefty start-up investment required for which insufficient government support is given in terms of funding. Theoretically, according to Butler's model (1980), Trinidad displays symptoms of being at the Development stage of the Tourist Area Life Cycle. At the development stage, visitor numbers are climbing and the destination has to put measures, facilities and amenities in place to cater to the increased arrival of visitors. 'Development' is a phase and it is one that requires proper management (Cooper *et al* 2005). In this regard, development of tourism facilities should not be pursued in an ad hoc manner but due consideration should be given to the environment.

More so, business tourism has growth potential both in terms of diversification and in terms of economic impact on the GDP. The WTTC (2009) revealed that business tourism grew steadily from 2004 to 2008. The US\$ in millions climbed from 159.0 in 2004 to 200.9 in the year 2008 and it is projected to increase further to 401.6 by the year 2019. While the business tourism market has growth potential and is a viable one, and environmental ills are increasing at a tremendous rate, the government has the capacity to put environmental protection orders in place so as to promote sustainable development and foster happiness. New Zealand provides a good benchmark of environmentally conscious strategies to encourage

sustainable business tourism. The country's strategies can be adopted wholly in some cases or customised to fit Trinidad's existing system and could lead to competitive advantage.

Environmental Strategies employed by New Zealand The environmental strategies employed by New Zealand, which have made it a competitive tourism destination, have been identified and listed in Table 1 (Source: New Zealand Sustainable Tourism Policy). These strategies include setting environmental indicators; putting supportive legislative framework; incorporating environment into its future strategy; and implementing and encouraging the use of more sustainable business reporting models.

Table 1: Identification of New Zealand Core Environmental Strategies

Set environmental indicators to guide the tourism industry forward
Put legislative framework to support the industry example. Waste Minimization Act 2008
Make the environment a core part of future strategy
Implement and encourage the use of more sustainable business reporting models
Foster tighter networking relationship between all key stakeholder groups
Set up a regional council pollution hotline where people can report pollution and environmental degradation
Develop and adopt a sustainability policy for the business and review it regularly
Develop an Action Plan, setting out ways to enhance sustainability performance; make someone responsible for each action and impose a deadline; review to ensure deadlines are met
Integrate sustainability into existing management systems and processes (example. Build ethical recreation principles into operations manuals)-develop and implement induction and training processes that include sustainability as a core element to include in operational manuals
Seek to become a carbon neutral certified business, reduce CO ₂ emissions as much as possible, and offset those that remain (example. By funding native tree planting or energy efficient schemes to compensate for carbon released from vehicle and boat operations)-work with other tourism businesses, councils and community groups to implement a local "Trees for Travelers" sponsorship initiative
Implement a formal client feedback process, and include sustainability performance as an area for comment; introduce client rewards for good ideas (example vouchers)
Become Qualmark endorsed, by meeting the requirements for environmental accreditation
Consult a business mentor, to identify more ways to operate efficiently (free up time), develop and grow the business.
Communicate sustainability objectives to staff (example through awareness sessions, meetings), encourage suggestions, actively involve them, and reward achievements (build values into performance criteria for staff)
Buy locally produced goods and services, sourced from medium, small and micro enterprises
Establish a partnership with a local school, and work with local and regional partners to support the school and environmental education (education outside the classroom-mentoring students)
Donate unused food to a food bank, food scraps to a pig farmer and donate old, partially used or unused products to local charities (example old linen, furniture, kitchenware, and office equipment that is still functional)
Reduce contaminants by using natural products such as citrus, salt, vinegar and baking soda to clean surfaces, windows, drains and floors
Educate guests as to how they can make a positive contribution to local biodiversity conservation efforts (example include information in compendium/notice boards on conservation efforts, volunteering and sponsorship opportunities)
Implement team building days, volunteering on local conservation project (beach clean ups etc.)
Review all products and services that you purchase, and advise your suppliers that you will give preference to products that meet social and environmental criteria (based on distance from origin, biodegradability, efficiency rating, recycled content, ability to be recycled etc.)
Keep the community informed of initiatives and seek involvement and support

This table provides a listing of environmentally friendly strategies engaged by New Zealand.

METHODOLOGY

Data

Qualitative research offers empirical information (Neuman 2006, Willis 2007, and Punch 2005), deep insight and richness of detail (Neuman 2006; Minichiello and Kottler 2009; Willis 2007; Hesse-Biber and Leavy 2006; Anfara and Mertz 2006; Punch 2005; and Outhwaite and Turner 2007). A qualitative research methodology was primarily selected to gather exploratory data in the area of business tourism and its environmental sustainability in Trinidad. This was necessary to get rich detail and probe the topic. A thematic analysis was then used for collating similar themes that emerged in the interview process. The data was collected from a structured questionnaire administered to seven key industry professionals who are located in the areas of: Ministry of Tourism (MOT); Tourism Development Company (TDC)/Convention Bureau; Bureau of Standards; the Environmental Management Authority (EMA); Trinidad Hotels Restaurants and Tourism Association (THRTA); Cascadia Hotel, a business hotel and a Tourism Consultant.

The Instrument: The formulation of the questionnaire entailed adapting relevant questions found in the literature (Cooper *et al* 2005; Edgell 1999; Duval 2004) with a view to addressing the environmental sustainability of business tourism in Trinidad. The questionnaire comprised of three sections with all open-ended questions. The first section asked questions pertaining to business tourism and its importance. The second section raised questions relating to the environmental sustainability of business tourism and the pros and cons of it. Finally, the third section solicited responses on issues pertaining to strategies and recommendations regarding the way forward for business tourism in Trinidad. The paper will also shed light on the various strategies employed by New Zealand and discuss whether these could be applied to the business tourism niche in Trinidad as a means of embracing environmental sustainability.

RESULTS AND DISCUSSIONS

This section of the paper presents responses from the seven interviewed respondents under three core themes: Business Tourism; Environmental sustainability of business tourism; and Future environmental strategy and recommendations.

Business Tourism: Consistent with the literature reviewed, all respondents agreed that increased technological advancements in air travel, economic growth, infrastructure, increased education and development of professional associations facilitated the growth of this niche market. However, one respondent stated that business travellers return to the destination as leisure or eco travellers because of environmental aesthetics and satisfaction. It was also determined that the increased propensity of business travel grew as a result of increased education, growth in bilingual skills, understanding of cultures, good knowledge of doing business, ease of travel, availability of facilities, and accessibility of company resources have all contributed to the rise of business travel. Respondents reported that the business tourism niche was a significant market to make investment. The respondents claimed that some factors which make Trinidad a budding tourism destination are: geographic location; existing industries; infrastructure and flights; accommodation and facilities; environmental aesthetics; uniqueness; sound environmental practices; experience of hosting conferences; English speaking; existence of an environmental body (Environmental Management Authority) that upholds the preservation of the environment and economic pricing (\$1 US = \$ 6 TT).

Sustainability of Business Tourism

The respondents stated that the environment is of paramount importance to any form of business and development. It is the responsibility of everyone including developers who design, build and engage in the supporting infrastructures. They are encouraged to follow established guidelines, practices, policies and the regulatory framework so that these projects conform to environmental standards. At the same time, businesses have caught on to 'going green'. Many hotels have in fact adopted environmentally friendly practices as those outlined in the literature review. Respondents revealed that initiatives like e-tickets, using environmentally friendly products, energy efficient equipment in hotels, natural lighting, reusing of wastewater and managing of waste are great environmental efforts that can go a long way in preserving the environment for future generations. Interviewees also mentioned that rainwater can be utilised for landscaping and measures designed to reduce the amount of water in flushing hotel toilets.

By engaging in environmental good practices, business tourists are influenced by these efforts and they follow the practice of locals in up keeping the environment. In most instances, they will return and encourage others to visit. Economically, this is good for a country.

Foreign exchange is earned on a continuous basis and there is a positive spill-off effect, which contributes to job creation, entrepreneurial ventures and linkages with other sectors. The respondents also supported a strong regulatory framework to protect, preserve, care and maintain the natural environment. They claimed that a green fund tax and funding of green fund projects should continue and expand. They also recommended the passing and implementation of the Beverage Container Act, which adds value to the environment; create employment, and supports recycling initiatives. All respondents supported the view that this country generates a lot of carbon emissions and pollution, and they suggested that the government should market carbon credits as done in the United Kingdom. They also claimed that tax breaks could be an option to encourage green practices.

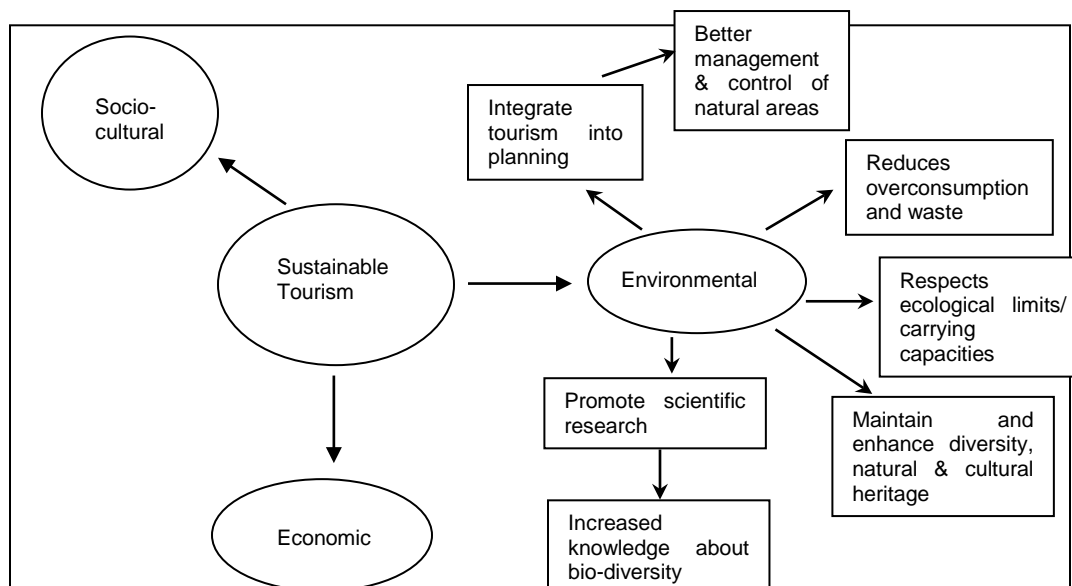

Future Environmental Strategy And Recommendations

Notwithstanding the existence of a Policy document (Trinidad and Tobago tourism policy) and a master plan (Vision 2020), all respondents were in favour that there should be environmental strategies for driving sustainable business tourism in Trinidad. In fact, the Government of Trinidad and Tobago has to adopt a policy to foster the development of economic activity in the country in an efficient, environmentally safe and sustainable manner. It was also suggested that there are skilled professionals who have the capacity and ability to inform this policy document. What is needed is more coordination among the key local stakeholders involved to move the environmental aspects of business tourism forward. The respondents shared the view that a strategy for an environmental public awareness drive is necessary. They claimed that this could be done through education and proper communication so that even the average person knows that there are benefits to be derived from environmental efforts when pursuing the diversification into business tourism. Communication has the tendency to shape behaviour and once people understand how they can benefit, they will buy-in and support such endeavours.

Respondents support the propensity of resource pooling as it affords cost effectiveness, diversification and promotes efficiency and effectiveness as it applies to environmental practices in business tourism. It was also mooted that benchmarking should be pursued vigorously to bring the tourism products in line with international green standards, practices, policies, legislations and regulations. Given the very nature of business tourism and its fragility, the strategic plan should also focus on sustainability and sustainable tourism development, address the challenges of traffic congestion, engage in strategic marketing and reform the legislation so that players can comply. Overall, six respondents agreed that business tourism in Trinidad was environmentally sustainable and share the view that if business tourism is to be a high quality sustainable industry, all players need to play their respective role to ensure the viability of the MICE industry. In summary, this paper presents a framework that speaks to a sustainable development

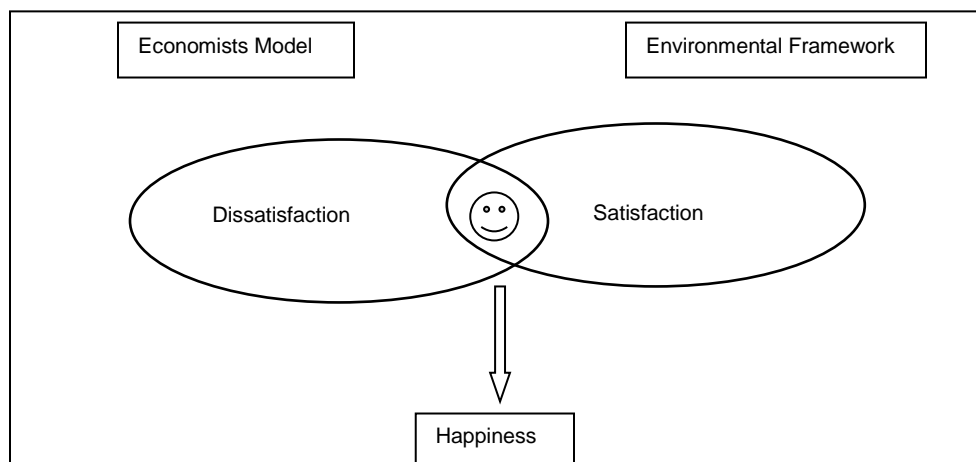

model and proposes an environmental happiness valuation model, which examines the satisfaction levels of all stakeholders. This model and the framework allow and display the importance of the environment, the economics and socio-cultural activities that influence sustainable tourism as the way forward. Figures 1 and 2 illustrate the model and the framework.

Figure 1: Pillars of Sustainable Tourism

This figure depicts the key components that influence sustainable tourism with particular emphasis on environmental sustainability.

Figure 2: A proposed environmental happiness valuation model

This figure displays a Venn diagram that illustrates the importance of the environment as it relates to Happiness.

It is felt that countries should now challenge the Gross Domestic Product (GDP) measurement metrics, that is the Economist’s Model, for measuring the wealth of a country as against the environmental framework adopted by Bhutan which lists environmental protection as one of the four pillars of *happiness* as more important than GDP. In this regard, countries must change their measurement metrics and question the Economist’s wealth valuation model. What is important is a country’s *happiness*, and money

(GDP) should not be the only yardstick to offer such a measurement. See the proposed *environmental happiness valuation* model and the contrasting views of the economists in Figure 2, which illustrates the relationship between the Economists' Model and the Environmental framework that measures the degree of satisfaction and dissatisfaction of these approaches. Note this figure depicts the contrasting views of the economists and environmentalists. Against this background, *happiness* should be the pillar all countries should foster for their citizens. Satisfaction leads to happiness, contentment and changes the quality of life. In short, any country that is seriously considering diversification into sustainable business tourism as the way forward, can apply this framework and the proposed environmental happiness valuation model.

Refining New Zealand's Environmental Strategies employed in its Business Tourism Sector to accommodate Trinidad

New Zealand is a pioneer in terms of environmentalism and therefore their strategies can be moulded into bespoke strategies and embraced by Trinidad to gain a competitive edge in environmental sustainability. Trinidad's MICE market can adopt and implement the strategies identified in Table 1. Table 2 depicts which strategies to adopt wholly and which to customize. What would be required is proper marketing, communication, awareness building and in some cases regulations (both new and enforced) to get compliance and support to drive sustainable business tourism forward.

Table 2: Strategy Adoption / Customisation to fit Trinidad's Existing Environment

Adopt strategy wholly (Strategy #)	Customise it to fit Trinidad (Strategy #)
1	2
3 – 5	6
7 – 9	10
11	12
13 – 22	

This table depicts which strategies to adopt wholly and those that require customising to Trinidad's unique market.

Multi stakeholder involvement and support is crucial for many of the strategies to bear fruit and become successful. Apart from stakeholder involvement and support, community awareness and buy-in is needed so that there can be understanding in what the country is attempting to achieve. Understanding would lead to support and this would translate to individuals behaving with self-direction and a level of consciousness towards safe environmental practices. While the Environmental Management Authority has the regulations (EMA Act No. 3 of 2000) to guide individual, group and corporate behaviour towards operating in a more environmentally friendly manner, these regulations are seldom enforce. New Zealand has sound legislative framework and has the support of key stakeholders who police the environmental laws. Trinidad also needs to follow suit with regard to this.

While people can report environmental transgressions to the EMA, 24-hour hotline numbers provide an option since it may be vital in gathering data to enhance and support environmental preservation. Other initiatives include a tree planting/gardening initiative to get visitors and local schoolchildren involved in the activity; programs targeted at schools to award the students who can implement the best recycling product, for example make handicraft with recyclable products; challenging local engineers to build structures with reusable materials; and ensuring that local businesses comply with service standards.

CONCLUSION

This study revealed that Trinidad could gain immensely in the area of business tourism if it manages the delicate balance between tourism development and environmental sustainability. All respondents agreed that the diversification into business tourism was economically sustainable as it offers one of the best

linkages to other sectors. Tourism represents one of many developmental activities that can be achieved in a responsible manner to prevent further loss to the environment as well as assist in reversing the environmental damage that has already occurred. The Government of Trinidad and Tobago has indicated its commitment to environmental preservation and upkeep in promoting sustainable development. Six out of the seven respondents supported the view that business tourism was environmentally sustainable in Trinidad. The challenges articulated are not insurmountable and with collaboration and key stakeholder engagement, there exist a potential for emerging economies to gain developed status. However, instead of attempting to re-invent ourselves into something which we are not, we should be focusing our diversification efforts in the area which we already have some competitive advantages.

This study brought forth an exploratory understanding of where Trinidad's niche is currently in position and it highlights that business tourism can be environmentally sustainable representing a valuable market to invest. It also makes recommendations for the way forward by examining New Zealand's strategies and proposes an environmental happiness valuation model.

Limitations

This exploratory research work has some limitations. For example, the sample size examined is small and one should be very careful when generalizing. Another limitation is that this study did not examine the economic and socio-cultural impact of business tourism. Cost and time were also constraints when this study was undertaken. Additionally, the results and findings were somewhat restricted given that the literature search found little empirical work on business tourism in Trinidad

BIOGRAPHY

Narendra Ramgulam is a Research Assistant with the Department of Management Studies at the University of the West Indies. His research interests include Business Tourism, Sustainability studies, Anthropology, Globalization and Management in the 21st Century. He can be reached at the University of the West Indies, St. Augustine Campus, Trinidad. His email contact is Narendra.Ramgulam@sta.uwi.edu.

Koshina Raghunandan-Mohammed is an Assistant Lecturer at the Department of Management Studies, The University of the West Indies (UWI). Prior to joining UWI, she gained a myriad of accounting, finance/investment and auditing experience in the credit union sector and the housing and education industries. She also has research interests in the following areas: Credit Unions, Risk Management Systems, SMEs, Financial Regulations and Environmental Sustainability. Her email contact is Koshina.Mohammed@sta.uwi.edu.

Moolchand Raghunandan is a Lecturer in Accounting at the University of the West Indies, St. Augustine Campus, Trinidad. He has been teaching undergraduate and graduate level courses, and facilitates workshops in the area of Financial Statement analyses. He has published articles in Singapore, USA,

ISER and the ICATT magazines. He has co-authored three textbooks that are currently being used by students both inside the university and outside. His email contact is Moolchan.Raghunandan@sta.uwi.edu.

THE IMPACT OF OWNERSHIP STRUCTURE ON VOLUNTARY CORPORATE DISCLOSURE IN ANNUAL REPORTS: CASE OF LISTED COMPANIES IN FIJI

Ifrax Khan, University of the South Pacific
Priyashni Vandana Chand, University of the South Pacific
Arvind Patel, University of the South Pacific

ABSTRACT

The extent of voluntary corporate disclosure by companies in the annual reports in recent years has been increasing due to various factors. There have been a number of prior studies that examines the relationship between ownership concentration and voluntary corporate disclosure and the findings suggest that there are less voluntary corporate disclosure in family owned and high shareholder concentrated firms. On the other hand, companies with low shareholder concentration are likely to have more voluntary corporate disclosure because of the principal to agent relationship as evidenced by prior research. Though studies have examined the impact of the ownership structure on extent of voluntary disclosure, there is still a need to investigate the issue in the Pacific Island countries, such as Fiji. The ownership structure of the companies in Fiji is highly concentrated. Therefore, this paper aims to examine the relationship between the ownership structure and extent of voluntary corporate disclosure in annual reports of the listed companies in Fiji. A content analysis approach will be undertaken and the findings will suggest as to how the ownership structure affects the extent of voluntary corporate disclosure in Fiji.

KEYWORDS: Ownership Structure, Voluntary Corporate Disclosure

INTRODUCTION

Following the major corporate collapses, the ongoing business scandals and the emerging issue concerning the protection of the minority shareholders, voluntary corporate disclosures has received considerable attention in the recent times. Meek, et al. (1995), define voluntary corporate disclosure as “disclosures in excess of requirements in annual reports and other media as deemed relevant by the company management for an effective decision-making by the users of the financial reports.” Prior studies, examined the impact of ownership structure on voluntary corporate disclosures, in countries such as US, UK, Continental European countries, Australia, New Zealand and in the Asian markets. See, for example, Cooke, (1991); Firth (1979); Frost and Pownall(1994); Gray, et al.(1995); Meek and Gray (1989); Meek, et al., (1995); Turpin and Dezoort (1998); Hossain, et al. (1994); Lau (1992); Chau and Gray (2002). Chau and gray (2002) found that there is a positive association between wider share ownership and voluntary corporate disclosures in Hong Kong and Singapore firms. Hossain, et al. (1994), presented similar result. These studies also find that there is less voluntary corporate disclosure in concentrated companies compared to dispersed companies.

On contrary, Samaha and Dahawy (2011), argue that very few studies examine the disclosure practices of the companies in the developing economies. Henceforth, this paper seeks to examine the level of voluntary corporate disclosures in Fiji, where there is presence of highly concentrated ownership. The highly concentrated ownership in Fiji is expected to have a considerable influence on the level of voluntary corporate disclosures. The controlling shareholders in these concentrated companies mostly maximize their self - interest and not that of the minority shareholders. Recently there has been a

considerable increase in the need to ensure that the interests of the minority shareholders are being protected. Providing less voluntary information to the minority shareholders is one of the ways that these controlling shareholders are able to expropriate them. The minority shareholders are entitled to receive all the relevant information to make an informed judgment on the performance of the company.

This paper contributes to the literature as it seeks to explain how is voluntary corporate disclosures influenced in an economy having highly concentrated ownership structure. The paper provides an insight on the differences that exists in the extent of the voluntary corporate disclosures among the shareholder concentrated companies. Overall, we found in highly concentrated companies, the level of voluntary corporate disclosures is low for the companies listed on the South Pacific Stock Exchange. The sections that follow discuss the literature and the research methodology. The fourth section sheds light on the results and discussions. The final section concludes the paper, with the limitations of the current study and provides recommendations for future research.

LITERATURE REVIEW

Agency Theory And Problem

Agency theory assumes that a separation of ownership from control would lead to agency problems as the agents (managers) will not always maximize the shareholder value. Agency problems theoretically arise due to divergent of interest and asymmetric information (Chrisman, et al., 2004). Managers have incentives to pursue their own interests at the shareholder's expense (Agrawal & Knoeber, 1996). If costless perfect information flow had existed, then a complete contract could have been written to avert any moral hazard problems. In that case, violation of the contract, for instance, due to opportunistic behavior, would lead to severe consequences for the agent. Since a perfect complete contract is not feasible, the principal has to use various incentives, punishments, bonding and the managerial processes to align the interest and the actions of the management (Chrisman, et al., 2004).

Agency costs are the costs incurred by organizations to minimize the agency related problems. Fama and Jensen (1983) define agency costs as the costs of all the activities and operating systems designed to align the interests or actions of the managers with the interest of the owners. It includes the costs of structuring, monitoring and bonding a set of contracts among agents with conflicting interests (Fama and Jensen, 1983). The shareholders incur agency costs if the manager owns less than 100 percent of the equity due to management shirking and perquisite consumption (Ang, et al., 2000). The managers have incentives to use the finance and other assets of the firm for their own benefit.

Monitoring costs are expenditures incurred by the principal to measure, observe and control the agent's behavior. Examples are mandatory audit costs, costs to establish management compensation plans, budget restrictions and operating rules. However, these costs are not borne by the principal as it is taken into account in the agent's remunerations. The poor or uncertain managers will face higher level of monitoring compared to the managers with a good reputation. Thus, as the cost of monitoring increases, the manager's remunerations decrease. Bonding also controls the agency problem. Since the agents ultimately bear the monitoring costs associated with the contracts, they will establish mechanisms to assure that they behave in the interest of the principal. Jensen and Meckling (1976) define bonding costs as the costs of establishing and complying with these mechanisms, which includes the costs of preparation of financial reports. Concentrated shareholders provide extensive monitoring over the management, as their benefits outweigh the costs of monitoring and allow the shareholders to recoup their investment (Gillian and Starks, 2000; Shleifer and Vishny, 1986). The large controlling shareholders in companies with concentrated ownership have more voting rights and larger incentives to monitor management than the shareholders in firms with disperse ownership. Thus, it follows that concentrated ownership would reduce the principal – agent problem between the shareholders and managers (Shleifer and Vishny, 1997) and hence lower voluntary corporate disclosure is expected. On the other hand, voluntary corporate disclosure would be higher in widely held firms so that the principals can ensure that

their economic interests are optimized by effectively monitoring the agent's behavior (Chau and Gray, 2002). As the disperse shareholders do not extensively monitor the agents behavior it is expected that the managers will provide more voluntary disclosures for the shareholders to measure the performance of the management and the business. Shleifer and Vishny (1986) state that dispersed shareholders lack incentives to monitor the management due to free rider problem. A number of studies showed that the high agency cost that exists in a principal-agent relationship will be eliminated if the owner is actively involved in the daily activities. See, for example, Chrisman, et al.(2004); Young, et al.(2008); Hu, et al. (2009); Jensen & Meckling(1976); Fama & Jensen (1983); Ang, et al.(2000).

Ownership Structure And Voluntary Corporate Disclosure

Ownership structure is defined by block holder ownership, managerial ownership, state ownership, legal-person ownership and foreign listing/shares ownership (Huafang and Jianguo, 2007). The two types of ownership structure are shareholder concentration and dispersed ownership. Shareholder concentration occurs when the single largest shareholder owns majority of the shares while many dispersed investors own the rest. This structure is common in emerging and developing economies such as China (Xu & Yan, 1999; Chen, 2001), India (Selarka, E., 2005) and Fiji (Naidu and Patel, 2009; Dharwadkar et al., 2000). On the other hand, dispersed ownership relates to many shareholders holding small proportion of shares (Ali, 2006). Dispersed ownership structure is common in organizations in developed economies such as United States and United Kingdom.

Ownership structure influences the extent of the voluntary corporate disclosure. Previous studies have indicated that there is a negative relationship between block-holder ownership and the level of voluntary disclosure (McKinnon and Dalimunthe, 1993; Mitchell, et al., 1995). Firms with concentrated ownership structure may have less voluntary corporate disclosure due to various reasons. Firstly, the controlling shareholders are able to monitor the behavior of management and have access to all the relevant information and thus do not necessitate additional disclosures. Secondly, the major shareholders in concentrated firms have incentives to monitor the behavior of the management, implying less principal to agent problem, and consequently less need for the corporate disclosures in addition to the requirements.

Furthermore, the type of controlling shareholders also influences the voluntary disclosures. Concentrated family owned firms would have less voluntary disclosures to ensure that the outside stakeholders do not have access to the company's information. In addition, firms having institutions as the controlling shareholders, have less incentive for voluntary disclosure. Institutions, as the major financiers, are able to access the relevant information, while the other stakeholders are unable to demand additional information. However, voluntary disclosures will be higher in institutionally owned firms when compared to family owned firms, as the institutions are not directly involved in the daily operations.

Gul & Leung (2004) found a significant positive association between voluntary segment disclosure and board independence for firms with less than 25 percent director ownership. This implies that greater board independence would lead to higher voluntary disclosures. A number of prior studies examined the association between corporate governance attributes and voluntary disclosures. Studies that examine the impact of corporate governance attributes on voluntary disclosures in developing countries include the work of Barako et al, (2006), Cheng and Courtenay (2006), Chau and Gray (2002), Eng and Mak (2003), Haniffa and Cooke (2002) and Ho and Wong (2001). This paper, however, specifically focuses on one key corporate governance attribute, the shareholder concentration and its association with voluntary corporate disclosure. The ownership structure of an organization determines the level of monitoring and thus affects the extent of voluntary disclosures (Samaha and Dahawy, 2011). Block holder ownership, the percentage of ordinary shares held by substantial shareholders is the measure of ownership structure for this study. Atmaja (2009) categorized firms as closely held (concentrated) or widely held (dispersed) based on whether a single shareholder controls more than 20% of the equity in a company. Twenty percent of shareholding is sufficient for effective control and decision-making and used in prior studies

(Faccio, et al., 2001; La Porta, et al., 1999). Hence, for the current study a company is concentrated company if the controlling shareholder holds more than twenty percent of the shares.

The percentage of ordinary shares held by the CEO and Executive Directors (managerial ownership) influence the level of voluntary disclosure (Samaha and Dahawy, 2011). According to the entrenchment theory, higher managerial ownership would lead to lower voluntary disclosure (Fan and Wong, 2002; Morck, et al., 1998). This is because managers would only maximize theirself-interest and not the value of the firm and hence provide lower voluntary disclosures. In addition, greater agency problems will exist when the managerial ownership is low because the executives will have higher incentives to consume the bonuses and less incentive to maximize job performance (Samaha and Dahawy, 2011). Hence, the voluntary disclosure by management might increase to reduce the firm's cost of monitoring by the controlling shareholders. Consequently, in their study, Samaha and Dahawy (2011) suggest that the level of voluntary disclosure will increase with the decrease in managerial ownership

Further, the controlling shareholders can effectively decide on the accounting reporting policies adopted by the business (Fan and Wong, 2002). Therefore, a lower level of disclosure is predicted in concentrated firms because the controlling shareholders do not have incentives to act in the interest of the minority shareholders. Another type of ownership structure is the government ownership. Firms owned by government are likely to have less voluntary disclosure because of the presence of extensive monitoring by the government. On the other hand, government owned corporations might have more voluntary disclosures to attract more potential investors. Thus, the extent of voluntary corporate disclosure in a country where all the listed companies are highly concentrated is expected to be low. As all the companies in the South Pacific Stock Exchange are highly concentrated this study will give an insight as to how the controlling shareholders in the concentrated firms are able to influence the level of voluntary corporate disclosure in annual reports. The ownership structure in Fiji itself gives us a motivation to investigate this issue by considering the disclosures in the annual reports. Thus, the research question that the current study seeks to address is:

“How is the level of voluntary corporate disclosure influenced in highly concentrated firms?”

RESEARCH METHODOLOGY

This study aims to investigate the level of voluntary corporate disclosures by the firms listed on the South Pacific Stock Exchange (SPSE), by adopting a content analysis methodology. Content Analysis provides an opportunity to gauge better and detailed information about the types of disclosures provided in annual reports. Previous studies on voluntary disclosures have adopted an empirical approach to investigate the relationships between various variables such as corporate governance attributes and level of voluntary disclosure. An empirical approach for this study is not appropriate due to data limitation given the infant stock exchange in Fiji. The corporate governance code was introduced in Fiji in the year 2008. This code required the listed companies and financial intermediaries to adhere to the principles and recommendations provided in the code on a ‘if not, why not’ approach. The reporting requirement in this code applies to firms with the first financial year commencing after 1st January, 2009. Henceforth, to carry out the content analysis we focused on the annual reports for the years 2009 and 2010, after the code has been effective. The two-year period analysis would provide an insight as to whether there was any impact of the code on the level of voluntary corporate disclosure.

This study adopts a two-tier analysis. In the first set of analysis we consider 14 out of the 16 companies listed on the SPSE. The two companies excluded from this analysis were internationally owned firms. The results obtained from this analysis provide an overview on the number of companies that provide voluntary corporate disclosures in their annual reports. To examine the level of voluntary disclosures, we classified the corporate disclosures under four categories, namely, Strategic Information, Corporate Social Responsibility, other Non-Financial Information and Financial Information. In the second set of analysis, we examine the impact of ownership type on the level of voluntary corporate disclosures. To carry out

this analysis we selected three family owned firms and three institutional owned firms. This study uses the 'number of sentences disclosed' as a measure to determine the level of voluntary corporate disclosure by these six firms under each category.

RESULTS AND DISCUSSION

Voluntary Corporate Disclosure

Table 1 below shows that the voluntary corporate disclosure by the listed firms in Fiji is very low. The analysis shows that only a maximum of 6 out of 14 companies provide disclosures on strategic information and corporate social reporting (CSR). The results indicate that only 46% of the listed companies provide strategic information and only 15% of the listed companies disclose CSR information in their annual reports. This implies that the companies do not consider it necessary to disclose information on the company's goals and objectives and the social and environmental practices. Mainly institutional owned companies disclose CSR information. In addition, the table reveals that while companies do provide some general information about the board of directors, very few (maximum of 8) companies disclose information on the different aspects such Board of Directors (BOD) qualification, other corporate governance practices, board committees and key executives. Furthermore, Companies do not find it necessary to disclose additional financial information in their annual reports. As shown in the table, approximately 60% of the companies discloses financial performance history and only a maximum of 46% of the companies provide financial analysis with the use of graphs and tables.

Table 1: Voluntary Corporate Disclosure by the Listed Firms in Fiji

Information Type	2009		2010	
	Number of companies	Percentage of companies	Number of companies	Percentage of companies
STRATEGIC INFORMATION:				
General corporate information	3	23	4	31
Corporate strategy	5	38	4	31
Future prospects	6	46	4	31
CORPORATE SOCIAL REPORTING:				
Environmental Information	2	15	3	20
Charitable/ Community programs	1	8	1	8
Marketplace	1	8	1	8
OTHER NON - FINANCIAL INFORMATION:				
General information about BOD	14	100	14	100
BOD Qualification	2	15	2	15
Board Committees	3	23	8	62
Other Corporate governance practices	1	8	7	54
Key Executive/employee information	7	54	5	38
FINANCIAL INFORMATION:				
Financial history	5	38	8	62
Financial analysis (graphs/tables)	6	46	6	46

This table shows the voluntary corporate disclosure by the 14 listed firms in Fiji, under the four categories. It shows the number of companies, which provide disclosures under the respective category and sub-categories for the two years, with the respective percentages of companies disclosing under each sub-categories.

Moreover, the results indicate that comparatively, from 2009 to 2010, the number of companies that provided voluntary corporate disclosure had increased. This increase may be due to the introduction of the code of corporate governance in 2008, which the listed companies have to adhere to from the financial year ending 2009 and onwards. The results also reveal that most of the companies that provide voluntary corporate disclosures are institutional owned. Since majority of the listed companies in Fiji are family and institutional owned, the result in table 1, provides the basis to analyze and compare the actual level of voluntary corporate disclosures in the annual reports of the family and institutional owned firms.

Type Of Ownership And Number Of Sentences Disclosed

Tables 2-5 considers the impact of the type of ownership on the level of voluntary corporate disclosure classified in four categories namely strategic information, corporate social reporting, other non-financial information such as board of directors and corporate governance mechanisms and the voluntary financial information. The results from Table 2 show that the selected companies provide very few sentences about their strategic information. This information is important for the existing and potential shareholders to determine the companies goals and objectives and the future prospects of the companies. The result suggests that the companies do not want to disclose their corporate objectives and future goals to other minority stakeholders.

Table 2: Strategic Information

Firms	Number of Sentences					
	General corporate information		Corporate strategy		Future prospects	
	2009	2010	2009	2010	2009	2010
FAMILY OWNERSHIP:						
1	0	0	0	0	0	0
2	0	0	0	0	1	0
3	0	0	9	9	0	0
INSTITUTIONAL OWNERSHIP:						
4	2	2	4	0	0	0
5	0	0	0	0	0	0
6	0	0	0	0	3	3

This table shows that the level of strategic information disclosed by the selected companies is very low irrespective of the ownership type. From the firms selected for analysis two of the family owned and two of the institutional owned firms had provided some strategic information particularly focusing on the corporate strategy. A maximum of nine sentences was disclosed about their strategic information.

The results on corporate social responsibility (Table 3) show that the companies place less emphasis on the CSR reporting. The companies only disclosed positive CSR information. The result implies that the companies do not consider that CSR reporting as important for the stakeholders.

Table 3: Corporate Social Reporting

Firms	Number of sentences of voluntary information disclosed			
	Social/Community programme		Environment	
	2009	2010	2009	2010
FAMILY OWNERSHIP:				
1	0	0	0	0
2	0	0	0	0
3	3	1	2	2
INSTITUTIONAL OWNERSHIP:				
1	0	0	0	0
2	0	0	0	0
3	0	0	0	0

This table shows the number of sentences disclosed by each firm with respect to the corporate social reporting. The level of CSR information in the annual reports is extremely low, as only one out of the six firms selected had disclosed two sentences regarding CSR. The firm that had disclosed this information was family owned.

Table 4 shows that the institutional owned firms disclose more sentences regarding corporate governance than the family owned firms. The first column shows that firms disclosed highest number of sentences regarding the board of director's composition, responsibilities and duties. However, the institutional owned firms had provided more information as evidenced by higher number sentences disclosed with respect to the board of directors, other sub committees and other corporate governance mechanisms. The number of sentences disclosed were higher in the year 2010 compared to year 2009. This shows that the introduction of the code influenced the companies to provide higher level of disclosure to ensure that they comply with the code. There is also lack of information regarding the board of director qualification,

board committees and other corporate governance mechanisms. This raises the question about the effectiveness of the corporate governance in these firms.

Table 4: Other Non - Financial Information

Firms	Number of sentences of voluntary information disclosed												
	BOD General		BOD qualification		Board committees		Other mechanisms		CG		Employees		Total number of sentences disclosed
	2009	2010	2009	2010	2009	2010	2009	2010	2009	2010	2009	2010	
FAMILY OWNERSHIP:													
1	1	13	0	0	0	9	0	18	0	0	28		22
2	1	1	0	0	0	0	0	0	2	0	3		1
3	2	4	0	0	2	2	0	0	4	3	8		9
INSTITUTIONAL OWNERSHIP:													
1	23	23	36	0	12	13	0	15	5	0	76		54
2	11	12	0	0	0	20	0	26	0	0	11		58
3	1	1	0	0	0	0	0	17	0	0	1		18

This table shows the number of sentences of voluntary information disclosed in the annual reports with respect to the board of directors and the other corporate governance mechanisms.

The listed companies also disclose very limited voluntary financial information in their annual reports as indicated in Table 5. This may imply that the companies do not want the minority shareholders and other stakeholders to know the financial performance of the company over the years.

Table 5: Financial Information

Firms	Number of pages of voluntary information disclosed			
	Financial history		Financial analysis (graphs and tables)	
	2009	2010	2009	2010
FAMILY OWNERSHIP:				
1	0	2	0	0
2	0	0	0	0
3	1	1	1	1
INSTITUTIONAL OWNERSHIP:				
1	1	2	2	2
2	0	0	0	0
3	1	1	1	1

This table shows that the selected companies mainly provided information on financial history over a ten-year period and financial analysis of the year with the use of graphs and tables. Two of the family owned firms and two of the institutional owned firms had provided the voluntary financial information for a maximum of two pages.

DISCUSSIONS

The voluntary corporate information serves as an important basis for the various stakeholders to make decisions. For example, the shareholders will rely on the additional information to make future investment decisions. It is also very important that the minority shareholders in highly concentrated firms are also able to access the voluntary corporate information. The minority shareholders need to be protected so that the controlling shareholders do not expropriate them. The level of voluntary corporate information in the annual reports is very low as shown by the results in this study. The companies place more emphasis on providing information related to the board of director's roles and responsibilities as it is recommended by the CMDA code of conduct. Furthermore, it is also noted that the firms also provide very less information regarding their CSR practices and the firms that do provide CSR information only provide positive information. The reason for the firms to provide only positive information is to gain and maintain legitimacy of their operations. The level of voluntary information had increase from the year 2009 to year 2010. This may have been due the implementation of the CMDA code of conduct that became effective for annual reports from the year 2010.

CONCLUSION AND FUTURE RESEARCH

In this study, we examined the impact of high shareholder concentration on the level of voluntary corporate disclosure. The introduction of the corporate governance code served as the basis of selection for the two years of annual report for analysis. The paper focused mainly on the family owned and institutional owned concentrated firms from the South Pacific Stock Exchange. The result of the paper supports the prior evidence that there will be lower voluntary corporate disclosure in highly concentrated firms. The institutional owned concentrated firms however, provided more voluntary disclosures compared to the family owned firms. The companies disclosed highest number of sentences regarding the board of directors and corporate governance attributes.

The study contributes to the prior literature as the focus was on high shareholder concentration as one of the corporate governance variable. The paper serves to give an insight that there is a need to enhance the level of voluntary corporate disclosures in highly concentrated firms to be able to protect the minority shareholders. The transparency of information regarding a business is vital to ensure that the minority shareholders are being informed and protected. This is an emerging issue especially in concentrated firms as revealed in the ADB report (1999). Considering the high shareholder concentration in Fiji, it is very important to enhance the transparency of information.

The paper also suggests that the introduction of some code of conduct can be helpful in ensuring that the companies increase their level of voluntary disclosure. As shown in this study the companies had slightly increased their level of voluntary disclosure after the introduction of the CMDA code of conduct. This study also has some limitations. Firstly, it is very difficult to generalize that the content analysis of annual reports only is an indication that the companies place less emphasis on the voluntary corporate disclosure. Thus, other media could have been considered. The study was only based on content analysis and an interview or questionnaire approach would have provided a greater insight.

This paper also serves as a basis for future research regarding the voluntary corporate disclosure. Firstly, the future research can consider the level of voluntary corporate disclosure in state owned enterprises and private enterprises. Secondly, the studies can also consider the voluntary corporate disclosure in other media such as the company's web sites. Since this paper was only based on the content analysis of the annual reports future studies can consider an interview and questionnaire approach to get the response of the prepares of the annual reports. In addition, an interview of the controlling shareholders and minority shareholders would also provide their perceptions regarding the voluntary disclosure practices.

MANAGING CLOUD HYBRIDIZATION

Peter Géczy, National Institute of Advanced Industrial Science and Technology (AIST)
Noriaki Izumi, National Institute of Advanced Industrial Science and Technology (AIST)
Kôiti Hasida, National Institute of Advanced Industrial Science and Technology (AIST)

ABSTRACT

Adoption of cloud-based systems by organizations has been relatively modest—regardless of significant marketing push by major public cloud providers. The cloud-based model utilizes distributed information technology services accessible via network environments. The network environments can be internal part of organizations' infrastructure—intranets, or external, such as internet or mobile networks. Utilization of internal network environments and services is the preferential mode of adoption by organizations—private clouds. External network environments and services provided by public cloud providers pose considerable risks to organizations. Among many risks associated with public clouds, the major are security, control, and accessibility. In public clouds, valuable organizational data can be compromised and damaged by external entities. Organizations utilizing public clouds lose control over their central data and services, while external entities gain control. Furthermore, internet is inherently insecure and substantially less reliable than organizational intranets. Despite notable contrasts in risks and benefits between public and private clouds, there are opportunities for organizations in adopting both private and public cloud systems—hybridization. Hybrid clouds present unique challenges and possibilities. We explore pertinent aspects of hybrid cloud systems and present suitable strategies for effective cloud hybridization management.

LOOKING TO ENVIRONMENTAL ACCOUNTING REPORTING IN A HIGHER EDUCATION INSTITUTE AND IDENTIFYING CRITICAL SUCCESS FACTORS

Mark Gandey, Bishop's University

ABSTRACT

There seems to be a large push towards a more environmental, sustainable corporate model. This revolution should not be found only in profit seeking companies, but arguable within higher education institutes, as well. There is a fragmented pool of information on the topic. There are various terms used with similar definitions (environmental accounting, ecological accounting, green accounting, and sustainability reporting). John Elkington's "triple bottom line" approach seems to be comprehensive. This is where economical, ecological and social "pillars" must hold. It is also referred to as the 3Ps (profit, people, place). The triple bottom line structure is applicable not only to companies, but also to other organizations, such as higher education institutions. Many universities are implementing "sustainability" concepts into their curriculum. It is important for these universities to "walk the talk". This paper looks into the identification of critical success factors to consider when implementing a sustainability strategy in a higher education institute.

INTRODUCTION

In order to help implement a more sustainable future at Bishop's University, I set out to develop a list compiling the most influential actions that can be taken. There is an abundant supply of literature on the topic of "sustainability in higher education." Specifically, the literature looks mainly at sustainability in terms of three interdependent "legs". Economic profits, usually the first leg, are required for an institution to be able to exist for the long term. The literature suggests that a sustainability strategy should also include an effort to implement ecological actions as well as an assessment of the social dynamics of the institution in order to ensure that the various stakeholders are able to work together and promote a sustainable environment. I've looked more thoroughly at the ecological and social legs to this point.

Ecological Considerations

A practical starting point when looking for ecological changes is within the campus buildings. Much of the literature suggests that a Leadership in Energy and Environmental Design (LEEDS) certification is of great value and has gained much publicity in the recent past. The spike in LEEDS almost doubled between 2006 and 2007, and benefits are being enjoyed campus-wide. For example, at the University of California's 10 campuses, all new building must be eco-friendly. Since 2004, this has resulted in \$5 million cost savings. (Ashkin, 2008). LEEDS focuses upon Sustainable Sites, Water Efficiency, Energy and Atmosphere, Materials and Resources, and Indoor Environmental Quality.

At Bishop's University, the following steps were taken in order to reduce the carbon emissions footprint (costs in parenthesis):

Installed a geothermal water heating system which will be able to heat certain campus building as well as to provide hot water for them. (\$3.168 million)

Modernized the entire lighting system of the university. (\$550k)

Optimization of the heating system in the Sports complex. (\$137k)

Other residences (principal and professor) that were not on the geothermal heating system were converted from heating oil to natural gas. (\$120K)

Updated thermostats from mechanical to electronic. (\$199k)

Implementation of an on-going “enhancement plan” to educate and encourage students and other members of the community to generate initiatives to save energy. (\$150k)

Developed a “Preventative, Predictive and Corrective action plan” in which all energy maintenance services were evaluated (\$75k)

Changed the windows (196 in total) in 3 similar student residences (\$152k).

These changes translated into a 64.2% reduction in CO₂ emissions. Krizek identifies 4 phases of university to campus approaches to campus sustainability.(Kevin, Dave, James, & Alan, 2012)The “grassroots” phase, the first, is when grassroots efforts are king. These are where various efforts are being demonstrated across campus as a result of ad hoc efforts from various units. This includes single department activities (recycling, limit pesticides, boycott plastic water bottles, bicycle campaigns ...). This phase should be kept to a minimum.The next phase, executive acceptance of the business case for sustainability, is where administrators see the efficiency in models that reduce costs or improve campus reputation. Accordingly, energy efficiency, water conservation and green branding/public relations programs are supported. All ideas are tested for value-added, and when the financial amount is not as large, the ideas are pushed down the priority list. “Costs still trump many other consideration and economic terms guide most decisions.The third phase, the visionary campus leader phase, the highest level of executives completely buy into a sustainable vision and push for it strongly.

This is a large part of their mandate. “The visionary campus leader reprioritizes sustainability efforts and is supportive of stakeholder engagement/inclusion, robust transparency/goal setting, and prospective full-cost evaluation practices. A visionary campus leader, furthermore, elevates sustainability professionals from mid-level coordination roles to the executive level – or at least reporting to the executive level.” There is usually some condition holding back the visionary from attaining the next level such as the legacy of older phase (ad hoc programs). The fourth stage is one that is fully self-actualized and an integrated campus community exists. This is what universities may aspire to exhibit. This fourth phase is characterized by engaged, visionary leadership and a fully integrated sustainability approach; this approach enhances educational outcomes by synergizing them with sustainability-related operations, student life, staff, and community engagement activities. Hence, the educational experience is coherent inside and outside the classroom; students learn about sustainability in all majors – and they observe and learn from the campus which physically models sustainability’s principles and practices.Williamson wrote that higher education administrators are work towards implementing a “portfolio greenhouse gas (GHG) mitigation policies congruent with American Colleges and Universities Presidents’ Climate Commitment (ACUPCC).

Social Considerations

Universities are made up of four main stakeholders. There are students, faculty, staff and alumni – each of whom have varying, and sometimes competing, priorities in terms of sustainability.(Kevin et al., 2012). Some would also include unions and the dynamic that they add also plays an important role.(Ferrer-Balas & Buckland, 2008).Corporate Social Responsibility reports have been around for more than 20 years. (Peter & Carol, 2011). A key element to developing the social aspect of sustainability lies in the governance. However, this is not an easy task. Governance involves abstract, highly politically charged concepts, and this makes it harder to access the social aspects of sustainability. (Suzanne, 2007)

Some research questions that might be addressed in this special issue include, but are not limited to, the following:(Brijdeep et al., 2003) How can organizational change in higher education institutions be initiated and/or supported through social accountability processes and stakeholder engagement?What are higher education institutions' logics for adopting social accountability and stakeholder engagement techniques to foster organizational change?How can the relationships between the kind of learning process and the level of organizational change be described?What mechanisms promote and enhance social accountability and stakeholder engagement?What are the limits of these mechanisms and how might these challenges be resolved?What constitutes engagement with stakeholders and how do different forms of stakeholder representation and engagement affect different aspects of organizational change?What are the cultural and organizational barriers to the communication between stakeholders engaged in the social accountability process and to the overall change process, and how might these be resolved?How do individuals interact around and through forms of social accountability systems?Which accountability and engagement frameworks can help to advance the institutional capacity to sustain progress in the area of university social responsibility?This list is not complete. There are many more questions that may be asked regarding the social aspect of sustainability in a higher educational institute.

CONCLUSION

It is important to look into the various strategies that have been developed in order to promote sustainability, however careful selection must be done in order to address the issues that are particular to your specific entity.

MANAGERIAL OWNERSHIP, LEVERAGE, AND AUDIT QUALITY ON FIRM PERFORMANCE: EVIDENCE FROM THE MALAYSIAN ACE MARKET

John C. Gardner, University of New Orleans
Amariah Hanum Hussin, UiTM Kampus Negeri Sembilan
Carl B. McGowan, Jr., Norfolk State University
Zuraidah Mohd Sanusi, Universiti Teknologi MARA
Zunaidah Sulong, Universiti Sultan Zainal Abidin

Abstract

This paper extends the audit fees literature by examining whether managerial ownership, leverage, and audit quality are associated with higher firm performance. The sample is 82 companies listed on the Malaysian ACE Market for the period from 2007 to 2009. Analyses of descriptive statistics, correlation analysis, and multiple regressions are used to address the research hypotheses. The descriptive statistics analysis reveals that ACE Market companies do not perform better for the three year test period. This result may explain why the number of listed stocks on the ACE Market decreased from 2006 to 2009. Contrary to the proposed hypotheses, this study finds that audit quality has a statistically significant negative effect on firm performance. The empirical results suggest that higher audit fees received by auditors may create bonding between client and auditors.

Keywords: Managerial ownership; Leverage; Audit quality; Governance mechanisms; ACE market; corporate governance

INTRODUCTION

Firm performance represents how effectively the managers operate the company, enhance the value of the firm, and provide other benefits to their shareholders. The relationship between managers and shareholders has raised the issue of conflict of interest when managers use discretionary power to act for their personal interest (Jensen & Meckling 1976). Therefore, firms need to have control mechanisms to ensure that shareholders' funds are not misappropriated or used for unprofitable activities. That is, firms need to insure that agency costs are minimized. The Mesdaq Market was changed to the ACE Market in 2009 to encourage the development of technology companies and high growth companies. However, the number of counters listed on the ACE Market has decreased from 2006 to 2008. Mesdaq Market (Malaysian Exchange of Securities Dealing & Automated Quotation) was officially launched on 6 October 1997. Mesdaq Market belongs to technology-based or technology incubators and other high growth industries. Starting from August 3rd 2009, the name of Mesdaq Market has been changed to ACE (Access, Certainty, and Efficiency) Market. The ACE Market will be an alternative market for companies of all sizes and from all economic sectors. The ACE market's regulatory framework promotes greater transparency via enhanced disclosures. This decrease in listings is due to reasons such as investors' perception of the inability of ACE market to perform in the long run and the ACE market may find it difficult to attract more potential investors (Wan Mahmood, *et al.* 2008). Wan Mahmood, *et al.* (2008) find that some of ACE firms are still under investigation for non-compliance with rules and procedures imposed by Securities Commission. Table 1 presents the total number of listed companies in the Main Market and the ACE Market from years 2003 to 2008. Listings on the main board and in the ACE Market rose to a peak in 2006 and fell each subsequent year. Table 2 shows the listing requirement changes for the Mesdaq Market and the ACE Market. Listing requirements for the ACE Market became more liberal to attract a broader array of companies.

Some investors believe that the volatile trend of the ACE Market will remain for a period of time unless there are some new regulations by the government to alter the market environment. Another reason for investors to leave the ACE Market is because the nature of stocks in ACE market is deemed as too speculative and high risk. Companies listed on the ACE market have a higher percentage of civil suits and financial fraud cases compared to companies listed on the Main Market. The merged Second and Main Board will be known as the Main Market and the Mesdaq Market will be known as the ACE Market, with ACE being an acronym for Access, Certainty, and Efficiency. The changes were implemented on August 3, 2009. Clearly this is an indication of poor governance practiced by companies listed on the ACE Market. Motivated by this situation, the current study investigates the relationship between established control mechanisms and performance of companies listed on the ACE Market. This study will focus on established governing mechanisms: managerial ownership, financial leverage, and audit quality, as tools to mitigate agency conflicts. The objective of this paper is to examine the relationship between managerial ownership, leverage, and audit quality on firm performance for companies listed on the ACE Market. This study is expected to provide empirical results that will be useful to regulators such as the Securities Commission, the Bursa Malaysia, and other professional bodies. Regulators and professional bodies may highlight some areas for improvement in corporate governance and appropriate action should be taken to enhance the quality of governance among the ACE Market companies.

Table 1: Total number of listed companies

Year	Main Board	Second Board	ACE Market	Total

The remainder of this paper is organized as follows. The second section provides a brief review of governance mechanisms followed a section where the hypotheses are developed The third section describes the methodology. This is followed by discussion of the findings. The paper ends with conclusions and suggestions for future research.

Governance Mechanisms In Malaysia

In Malaysia, corporate governance mechanisms are from the directions provided in the capital master plans and in orders from regulatory bodies. Corporate governance is based on the reforms agenda contained in the Malaysian Code on Corporate Governance, the Capital Market Master Plan (CMP), and the Financial Sector Master Plan. The issues that are highlighted in the agenda are the composition of the corporate board of directors, recruitment of new directors, remuneration of directors, the use of board

committees, board committee mandates as well as their activities (Abdul Hadi, *et al.* undated). As such, Malaysia is still weak with respect to corporate governance reforms and emphasizes the importance of governance mechanisms to achieve the highest level of transparency. Indeed, the establishment of the Capital Master Plan aims to strengthen minority shareholder's right, enhance the quality and independence of auditors of public listed companies, improve the channels of communication between companies and shareholders, enhance disclosures in annual reports, require shareholder value disclosures for securities issuance, regulate restructuring, takeovers and merger exercises, and introduce measures to enhance regulatory transparency, accountability and independence (Abdul Hadi *et al.* undated).

The effectiveness of the actions taken to regulate the practices of corporate governance in Malaysia can be evaluated from prior empirical studies. However, most of the literature regarding corporate governance in Malaysia is done in corporate sectors of the Main Market. Little research has been conducted using ACE Market listed companies. Thus, the current study attempts to examine the association between corporate governance mechanisms of firms listed on the ACE Market and firm financial performance.

HYPOTHESIS DEVELOPMENT

Managerial Ownership and Firm Performance: Managerial ownership is one of internal mechanisms that govern firm performance. A high level of managerial ownership may motivate managers to act in the best interest of shareholders and may serve as a positive monitoring substitute to reduce agency conflicts and costs, Jensen and Meckling (1976) and Demsetz and Lehn (1985). In Malaysia, owner-managed companies are common among public listed companies. According to Claessens, *et al.* (2000), at the 20% cut-off of ownership control, about 85% of Malaysian listed companies have owner managers.

Jensen and Meckling (1976) find that managerial ownership can help reduce agency costs because a manager who owns a large fraction of the company's shares bears the consequences and benefits of managerial actions that either decrease or increase the value of the firm. In contrast, managers who own a smaller percentage of a company's shares have greater incentives to pursue personal benefits instead of maximizing overall firm value. Hence, research suggests that agency costs would be lower in companies with a higher proportion of share ownership by managers. Furthermore, managers may have an interest through various incentive systems to own shares in the company. With an alignment of owner-managers' interests with shareholders' interests, opportunistic behavior by controlling shareholders or managers is reduced. As a result, managers may have the incentive to maximize overall company value as the managers will benefit from increases in overall firm value, Jensen and Meckling, (1976). This increase in the incentives to maximize overall firm value results because controlling shareholders and managers who have a financial stake in the overall value of the firm will work harder and will take reasonable risks in order to ensure increased firm performance. Consistent with the above arguments, it is expected that higher managerial ownership levels are associated with better firm performance. Therefore, the following hypothesis will be tested:

H₁: There is a positive relationship between managerial (insider) ownership and firm performance
Leverage and Firm Performance

Leverage is one of the external mechanisms which decision makers believe to be a useful tool to reduce agency costs. Debt holders such as financial institutions and banks will monitor managers' actions to ensure that managers' optimize the financial performance of the firm, Sanda, *et al.* (2005). This external monitoring will allow debt holders to evaluate the eligibility of the firm to receive loans and honor any debt agreements and covenants. In particular, financial leverage will reduce agency costs to shareholders and other stakeholders by having a large creditor monitor managers' performance. Large creditors are normally financial institutions which are stakeholders of the firm who have a vested interest in the ability

of the firm to continue to make interest payments and repay loan principal. Financial leverage providers will have an incentive to see that managers take performance-improving measures, Sanda, *et al.* (2005). Thus, as suggested by Jensen (1986) it can be argued that high financial leverage reduces agency costs and improves a firm's financial performance. A number of empirical evidences support Jensen's assertion. Jensen (1986) highlights the importance of debt in limiting managerial discretion over the use of free cash flow. Furthermore, Sanda, *et al.* (2005) find that financial leverage has a significant positive influence on overall firm performance in Nigeria, indicating the tendency for firms with higher levels of debt as a proportion of equity to perform better. Therefore, the following hypothesis will be tested:

H₂: There is a positive relationship between financial leverage and firm performance.
Audit Quality and Firm Performance

Prior studies have shown that higher fees paid to auditors will strengthen the economic bond between management and auditors and impair auditor independence, Ashbaugh, *et al.* (2003), Boylan (2004), and Steven (2007). These empirical findings will lead to reduced audit quality resulting in greater reported earnings management by managers. Frankel, *et al.* (2002) provide evidence that the non-audit fees to total fees is positively associated with small earnings surprises and with the magnitude of discretionary accruals. On the other hand, Kinney and Libby (2002) argue that total fees paid to an auditor may increase the economic bond to a client and reduce earnings management by managers. However, Griffin, *et al.* (2008) examine the audit fee-increasing relationship because auditing services provide one means to increase the level and quality of corporate governance. The authors find that there is a positive relationship between audit fees and the level and quality of corporate governance. This is consistent with the Sarbanes-Oxley (SOX) legislation, which imposed incentives on many companies to strengthen corporate governance, including increased auditing and internal control spending. Hence, even though better corporate governance, including auditing is costly, increased corporate governance may enhance the quality of financial statements and increase the efficacy of internal control systems. This will eventually result in better firm financial performance. Therefore, the above arguments suggest the following hypothesis:

H₃: There is a positive relationship between audit quality and firm performance.

RESEARCH METHODOLOGY

Sample Selection And Data Sources

Initially, the sample for this study was comprised of all companies listed on the ACE Market of Bursa Malaysia from January 2006 to December 2009. A list of companies listed on the ACE Market is obtained from Bursa Malaysia website (<http://www.bursamalaysia.com>). Of the 122 companies listed on the ACE Market, 83 companies are included in the sample. The remaining listed companies did not provide all of the financial information required for the study. A number of companies which do not publish their annual report on the Bursa Malaysia website are excluded. In addition, after the normality of the data has been tested, one company was excluded due to outlier effects. Therefore, only 82 companies are finally included in the final sample. This study uses two data sources for information. First, Datastream database is used to provide financial data such as assets and liabilities. Second, data on managerial ownership structure, types of auditor, and audit fees are retrieved from individual company annual reports available through the Bursa Malaysia website. All the annual reports are downloaded through (<http://announcements.bursamalaysia.com>). Finally, all the necessary data are analyzed using correlation and regression analysis to determine the efficacy of the proposed hypotheses.

The Variables And Measurement Dependent Variable

Firm Performance: This paper uses Tobin's Q (Q-Ratio) as a measure of firm performance. Tobin's Q for the combined market value of all the companies on the stock market should be about equal to their replacement costs, Lindenberg and Ross (1981). In other words, Tobin's Q measures firm performance based on market-value. Following Zunaidah and Fauzias (2008), this study has uses the modified version of Tobin's q ratio as a measure of firm value, calculated as the ratio of sum of market value of equity plus total debt to book value of total assets.

Independent Variables

Managerial Ownership: The problem of agency theory concerning the use of managerial (insider) shareholdings is discussed extensively in McConnell and Servaes (1990, Yeboah-Duah (1993), Loderer and Martin (1997), Chen, *et al.* (2003), and Florackis, *et al.* (2007). However, the empirical results are mixed. In particular, McConnell and Servaes (1990) find a significant curvilinear relationship between insider ownership and firm performance. Loderer and Martin (1997) find no statistically significant relationship between insider ownership and performance. Florackis, *et al.* (2007) report a non-linear relationship between managerial ownership and corporate performance by using a semi-parametric estimation approach, drawing conclusions contrary to those of Yeboah-Duah (1993). In the current study, managerial ownership is measured as the total percentage of shares directly held by non-independent executive directors in the company. Following Nazli and Weetman (2006) and Zunaidah and Fauzias (2008), the current study does not include shares held by independent non-executive (outside) directors because the outside directors are expected to play a monitoring role and limit managerial opportunism.

Leverage: Leverage is defined as debt owed to large creditors such as financial institutions. Leverage has been shown to be a useful tool for mitigating the agency problem. Jensen and Meckling (1976) show that financial leverage has a significant impact on financial performance. Financial leverage influences firm performance through monitoring activities by debt holders. Problems of agency theory arise when there is a conflict between the interests of shareholders and the interests of debt holders. Such problems start when the company needs to honor the loan agreement with the debt holder even when the company is not performing well. However, if the company is performing very well, then the shareholders will reap the incremental benefits. Thus, shareholders receive greater benefits than debt holders during periods of good financial performance. The current study uses total debt divided by total assets to measure financial leverage.

Audit quality: The demand for auditing arises as a result from the auditor's monitoring role in the principal-agent relationship, Eilifsen and Messier (2000). Financial reporting or disclosure quality had been measured as one of the mechanisms in assessing the corporate governance of a firm, Mitton (2002) and Coles, *et al.* (2001). Auditing is necessary to ensure the financial transparency that provides depositors, creditors and shareholders with credible assurances that the corporate managers will not engage in fraudulent activities. On the other hand, the role of statutory auditors and the demand for audit quality are influenced by corporate governance characteristics and the legal system of investor protection, Piot (2001). As summarized in De Fond (1992), past studies have shown that the demand for audit quality is a function of the agency conflict caused by the disparity between management and ownership incentives. Thus, the current study will use audit fees as a proxy for audit quality.

Audit fees are defined as the sum of all fees including audit fees and non-audit fees paid to the auditor, Hoistash (2007). Fees include costs for professional audit services as well as non-audit fees charged by the auditor to the client. This approach to measuring audit fees is in accordance with the standards published by the Public Company Accounting Oversight Board, which states that fees for professional services are necessary to perform an audit or review including services rendered for the audit of the

company's annual financial statements. This clause extends to the services incurred with rendering an opinion under Section 404 of the Sarbanes-Oxley Act of 2002 and with the review of quarterly financial statements. In addition to the amendments of Corporate Governance, the Securities Commission of Malaysia issues new regulations to all listed companies to disclose audit fees in the annual report.

Table 3: Summary of variables and their predicted direction with firm performance

Variable	Measurement	Predicted direction
<i>Dependent Variable</i>		
• Tobin Q (Qratio)	$Q_{ratio} = \frac{MVE + TDEBT}{TOTASST}$	
<i>Independent Variable</i>		
Governance Mechanisms		
• Managerial ownership (MO)	Total percentage of shares directly held by non-independent directors of the company	+
• Leverage (Lev)	Total Debt / Total Assets	+
• Audit Quality (AQ)	The sum of all audit fees paid to the auditor	+
<i>Control Variables</i>		
• Firm size	Natural log of total assets $\ln(\text{Total Assets})$	
• Profitability	Earnings per share (EPS)	

Control Variables

Firm size: The current paper includes firm size as a control variable because firm size has been shown to be a determinant of firm financial performance. Normally, larger firms are perceived differently by shareholders. For example, there is an assumption that larger firms may pay higher dividends and may have larger boards. This hypothesis is supported by the empirical results of Short and Keasey (1999), who report that firm size has a statistically significantly positive effect on financial performance, since larger firms have the potential to access funds with greater ease, both internally and externally. Larger companies may have better growth opportunities and access to additional financing opportunities. Larger companies may have a greater analyst following, have more information available which reduces information asymmetry, and have wider share ownership and a more extensive ownership profile. The natural logarithm of the firm's total assets is used to indicate firm size. This measure is consistent with studies which have used total assets to measure firm size, Abdussalam (2006).

Profitability: Earnings per share (EPS) is used as a measure of a firm's profitability, Kumar and Sopariwala (1992), Ahmed and Khababa (1999), Kaufmann, *et al.* (2000), and Al-Malkawi (2005). EPS is considered to be "the market's pre-eminent measure of firm performance," Kaufmann, *et al.* (2000, page 219).

DATA ANALYSIS

It is necessary to assess the normality of a variable relative to other variables in the sample. After assessing normality of a variable, some variables are transformed to obtain normality. It is noted that skewness and kurtosis are extreme and thus need to be accommodated, Coakes and Ong (2009). Transformed variables included the Q-ratio, managerial ownership, leverage, total audit fees, and firm size. The remaining variable which is profitability is remained because transformation is not an option to analyze correlation among variables.

EMPIRICAL RESULTS - DESCRIPTIVE STATISTICS

Table 4 shows the descriptive statistics of the sample selected for the three consecutive years, 2006 to 2008. The sample data are collected for 82 companies listed on the ACE Market. The outliers' data consist of the log Tobin-Q Ratio is more than 1.2 while all other variables are range between 0.2 and 0.9. Finally, the total number of data (N) is 246 comprises of 82 companies for each year are analyzed.

Descriptive Statistics						
Statistic	<i>Tobin-Q Ratio</i>	<i>Managerial Ownership</i>	<i>Leverage</i>	<i>Audit Quality</i>	<i>Firm Size</i>	<i>Profitability</i>

Note: The asterisks ** and * denotes correlation is significant at 0.01 and 0.05 levels (1-tailed), respectively.

Correlation Tests

Table 5 shows the correlation coefficients between all of the independent variables and the dependent variable. Managerial ownership, leverage, total audit fees, and firm size are positively correlated with the Q-ratio at the 0.05 level of statistical significance for managerial ownership and at the 0.01 level of statistical significance for the other variables. On the other hand, there is no significant correlation between the profitability and Q-ratio.

Table 6: Summary results of correlation analysis for Tobin-Q measurement

	Research Hypotheses	Prediction	Result	Hypotheses
H ₁	There is positive relationship between managerial (insider) ownership and firm performance	Positive	Significant (Positive)	Supported
H ₂	There is positive relationship between leverage and firm performance	Positive	Significant (Positive)	Supported
H ₃	There is positive relationship between audit quality and firm performance	Positive	Significant (Positive)	Supported

Results Of The Multiple Regressions

Multiple regression analysis is one of the parametric techniques that can be applied if the data is assumed to be normally distributed. However, regression analysis is fairly robust for validity against non-normality. Pallant (2007) argues that with a sample size greater than 30, the violation of the normality assumption should not cause any major problems. Based on this argument, a multiple regression analysis

as an extension of the correlation analysis is conducted. The main difference between correlation analysis and regression analysis is that, in bivariate correlation, the relationship is only tested between one independent variable and one dependent variable whereas, in multiple regression analysis, more than two independent variables will be tested for their explanatory power against one dependent variable. The regression model is estimated based on three (2) models as follow:

Model 1: Regression analysis of internal governance (managerial ownership)

Where: α = intercept term, β_1 = regression coefficient, ϵ = standard error

Model 2: Regression analysis between internal governance and external governance (managerial ownership, leverage, and audit quality)

Where: α = intercept term, β_1 until β_3 = regression coefficient, ϵ = standard error For Model (1), the equation indicates the contribution that internal governance measured by managerial ownership has on firm performance which is measured by the Q-ratio. Model (2) measures the contribution of the internal governance variables measured by managerial ownership and external governance measured by financial leverage and audit quality make to the prediction of firm financial performance measured by the Q-ratio.

Hierarchical Regression : Table 7 reports the hierarchical regression results for managerial ownership, leverage, and audit quality on firm financial performance (Q-ratio) after controlling for the effect of firm size and profitability. Model (1) shows the impact of the internal control mechanism, which is managerial ownership on firm financial performance. The regression coefficient for firm size is statistically significant at the 1% level and is negative. The regression coefficient for profitability and managerial ownership are not statistically significant.

The adjusted R^2 for the regression is 4.68% and the F-statistic is 4.951 and is statistically significant at the 5% level. This means that 4.68% of the variation in firm's performance is explained by the variation of managerial ownership after controlling for the effect of firm size and profitability, taking into account the sample size and the number of independent variables. Meanwhile, for Model (2), the adjusted R^2 is 8.1% meaning that 8.1% of the variation of firm financial performance is explained by the internal mechanism, i.e. managerial ownership, and the two external mechanisms, i.e. financial leverage and audit quality, after controlling the effect of firm size and profitability, taking into account the sample size and the number of independent variables.

As shown in Model (2), the regression coefficient for audit quality is statistically significant at the 1% level and is negative. This means that there is a negative relationship between audit quality and firm financial performance for firms listed on the ACE market. This is probably due to higher audit fees received by auditors which may create a bonding between clients and auditors. This empirical result is consistent with the empirical results of Hoitash, *et al.* (2007) who found that economic bonding is a determinant of auditor behavior rather than auditor reputational concerns. However, the regression coefficients for managerial ownership and financial leverage are not statistically significantly related.

Table 7: Result of hierarchical regression analyses examining the impact of managerial ownership, leverage and audit quality on firm performance.

SUMMARY AND CONCLUSIONS

The current study examines the financial performance of companies listed on the ACE Market in Malaysia which has rarely been examined. The current study examines the relationship between corporate governance mechanisms such as managerial ownership, leverage, and audit quality and firm financial performance using a sample of 82 companies listed on the ACE Market in Malaysia for the period of 2006, 2007, and 2008. The statistically significant and positive correlation between the three independent variables, managerial ownership, leverage, and audit quality, indicates the importance and impact of these corporate governance mechanisms in firm financial performance. The current study provides empirical results that are useful to regulators such as financial institutions, the Securities Commission, and the Bursa Malaysia. Regulators and professional bodies may highlight some areas of improvements and appropriate actions should be taken in order to enhance the quality of corporate governance mechanisms among ACE market companies. In addition, the Securities Commission can use the empirical results of the current study to develop mechanisms to facilitate the regulation of corporate managers as a part of the Securities Commission's regulatory responsibilities. For example, the Securities Commission may tighten the regulation of applications for financial sources from the Ministry of Finance, so that if financial assistance is given to a company the money will not be used in the self-interest of management.

Furthermore, the current study highlights some of the recommendations to financial institutions as in line with the new regulations of the new ACE Market. Starting August 3, 2009, the name of Mesdaq Market has been changed to the ACE Market which required lenders to play an increased role in overseeing the operations of firms. The main limitation of this study is that the sample is limited to 82 of the 122 companies listed on the ACE Market. Hence, the conclusions from this study may not be generalized to the actual performance of all ACE Market companies or to companies listed on the Main Board or the Second Board of the Bursa Malaysia. In addition, this research is conducted for a three year time period, which may limit applicability and require further and longer term analysis.

ANALYSIS OF SALES FORCE'S ATTITUDES REGARDING TECHNOLOGY: SEGMENTATION BASED ON ATTITUDES AND EVALUATIONS OF IDENTIFIED SEGMENTS. AN EXPLORATORY STUDY FOR BASQUE COUNTRY

Julián Pando García, University of the Basque Country
Virginia Rincón Diez, University of the Basque Country

ABSTRACT

Technology has changed company activity, since it has equipped companies with elements which give them better and greater knowledge of their target audiences and clients. Within the commercial scope of organisations, it is important to understand which factors explain better use of technology. Under this premise, in this project, a study on vendors' attitude toward technology and on their use of technology is developed. We have analysed different sales force opinions toward technology so as to later on develop a segmentation of vendors, characterising each one of the segments identified based on the variables used. In the results, the relationship different variables have is described, such as the sales force job, the industry or the size of the organisation wherein their activity is carried out, in relevance to the different vendors' segments.

CLASSIFICATION JEL: M31

KEYWORDS: Sales force, attitudes toward technology, market segmentation

INTRODUCTION AND REVISION OF LITERATURE

Technology is an essential element for the development of organisations. Commercial and sales areas are no exception. Several studies have analysed the development of different aspects concerning sales force automation. Sales force automation is a process wherein several organisations observe problems in adopting and implementing it. The ratio of negative experiences in implementing technologies such as CRM or SFA (Sales Force Automation) is situated between 50% (Amerongen, 2006; Froom, 2000; Rigby, Reichheld and Schefter, 2002) and 75% (Kaido, 1999; Petersen, 1997). Within literature on implementing technology in sales forces, Parthasarathy and Sohi (1997) suggest that adopting automation systems goes through two stages. In the first stage, the organisation takes the decision to adopt a technology, and then the vendors must choose whether or not to adopt that technology. This is denominated as "dual adoption" (Buehrer, Senecal and Pullman, 2005). If we take into account that adopting technology in the sales force is a dual adoption, for it to succeed, the second phase previously mentioned is determining (Amerongen, 2006; Boldgett, 1995). The literature indicates that a large part of the sales force does not adopt the technologies, or adopts them with very low use of all of their potential (Buehrer et al, 2005, p. 390). As indicated by Xu, Yurong, Yen, David C., Lin, Binshan and Chau (2002), employees' resistance is one of the main risks in implementing CRM technology. Several authors indicate the existence of factors which explain the underuse of the technologies implemented, such as (Jones, Eli, Sundaram, Suresh, Chin and Wynne):
Natural inertia.

- Low perception of value (Cost vs. Benefit).

- Low support from the organisation.
- Personal and demographic factors.
- Low reward for change.

Many of these factors have not been empirically analysed, and others were studied specifically for some specific industry. For example, Jones et al. studied the influence of individual variables on the intent-to-use for commission-based insurance agents. Revision of the literature suggests the need to study the factors of the vendors' attitude toward technology in general, and evaluation of the benefits it provides.

We definitively believe that the role of vendor attitudes toward using technology, and the influence their work position, their industry or organisation size has on vendors' opinions has not been sufficiently developed in the literature. Our goal is focused on evaluating vendors' attitudes regarding adopting technology in their activity, but our interest consists more specifically of determining if different vendor groups exist, characterised by showing similar attitudes toward technology. Based on the previous evaluations, a segmentation technique was used which allows to group the vendors based on a series of items which we can group as elements of the vendors' "attitude toward technology". Our hypothesis to be contrasted would be based on the fact that vendors do not show homogeneous attitudes regarding using technology in their professional activity.

METHODOLOGY

After revising the literature, several interviews were carried out with different vendors in order to adjust the items from the selected scales to the scope of commercial activity in Basque Country. Based on these interviews, the world café technique was applied to develop the questionnaire with the different items to be measured in the survey. Later on, an empirical study was developed to collect the evaluations of vendors and sales managers of the questions asked. In-field work for said empirical study was done between March and April of 2010. The sample type was a quota sample, wherein quotas were employed for vendor type and company activity variables. The technique used was cluster analysis. This technique allows for making attitudinal segmentations. The Cluster Analysis allows for determining how to group objects (brands, products, purchasers) into different segments within the population they form a part of.

After classifying the objects (vendors, in this case) into groups, we began developing profiling for the different clusters or groups. To this end, the first thing is to see how these different groups evaluate the items regarding attitude toward technology, used to develop the groups. Later on, we analysed the profile of vendor groups or segments based on other classification variables used in the study, such as the industry, the company size, the geographical scope of the company's activity, or the sales position type from whence their activity is developed.

CONCLUSIONS

The adoption and implementation of technology by sales force is a process wherein several organisations have found themselves with problems. Failure percentages are elevated partially due to adaptation problems of the vendors themselves. If we take into account that sales force adopting technology is a dual adoption, the sales force's attitudes toward technology becomes an important aspect for the final success of implementation of different types of technologies. The result may be not using it, or also under-using it. The empirical study shows us that the majority of vendors respond that they use technology in their professional life. Insofar as the type of technology they use is concerned, in general, we can observe an

elevated use of mature technologies such as the mobile telephone, the computer, email, an average use of databases, and a lesser use of more current technologies such as CRM, Web 2.0 or social networks.

Regarding whether vendors are consulted or not for the implementation of new technologies within the commercial scope, one-third of those surveyed indicate that they had participated in the implementation process for new technologies for the sales force. Vendors give high ratings to affirmations such as “technology is mandatory for any organisation” (7.95 out of 10) and also “technology improves the efficacy of my work, which translates to better results (7.34 out of 10), while they do not agree so much with “it basically means more work for the vendor” (4.33 out of 10) and with “it is mainly applied in companies to control the vendor more” (4.95 out of 10). Regarding the benefits, we can highlight the high ratings given in general by vendors to the majority of the aspects studied. As our starting-point hypothesis, we proposed the heterogeneity of vendor attitudes concerning the use of technology. We confirmed said hypothesis by describing four different segments. We have called the analysed segments: “Technologists oriented toward control”, “Concerned by technology”, “Convinced by technology” and “Sceptical of technology” based on the ratings given to the variables used.

The “Technologists oriented toward control” are mainly vendors without management responsibility, of a relatively younger age, largely from average or grand companies, and from all sectors and geographical scopes. Those “Concerned by technology” are also mainly vendors, largely from the services sector and of a local scope. Those “Convinced by technology” are more managers or sales managers, from average or large companies, largely from industrial companies and of an international scope. Those “Sceptical of technology”, work mainly in small companies in the commerce sector of a mainly local scope.

RESUMEN

Para un mundo globalizado y marcado por constantes y dinámicos cambios el objetivo fundamental de las organizaciones será redescubrirse, priorizando los elementos que les serán de utilidad para la consecución de los objetivos propuestos. Reconocer al talento humano como el eje a través del cual la creatividad y la innovación se manifiestan de forma efectiva, será un factor fundamental para el desarrollo de la gestión de la innovatividad. En este sentido las Instituciones universitarias como entes gestores del talento, están llamadas a participar, promoviendo entre los estudiantes la generación de respuestas concretas con soluciones innovadoras para circunstancias sociales diversas, a través del estímulo a su talento creativo (con base en la motivación, el ingenio y la organización), al tiempo que servir como referencia a la solución de situaciones similares en comunidades diferentes a las de su inicial ámbito de acción. El presente trabajo se plantea como objetivo, discutir lineamientos que permitirán la gestión de innovatividad en las universidades, tomando como referencia la experiencia de la Comisión Eureka, de la Universidad Nacional Experimental "Rafael María Baralt".

PALABRAS CLAVE: Gestión de Innovatividad, Estudiantes Universitarios, Comisión Eureka Unermb

UNIVERSITY INNOVATIVENESS MANAGEMENT

ABSTRACT

For a world included and marked by constant and dynamic changes the fundamental aim of the organizations will be rediscover, prioritizing the elements that they will be of usefulness for the attainment of the proposed aims. To recognize to the human talent as the axis across which the creativity and the innovation demonstrate of effective form, it will be a fundamental factor for the development of the management of the innovativeness. In this respect the university Institutions as managing entities of the talent, are called to take part, promoting between the students the generation of concrete answers with innovative solutions for social diverse circumstances, across the stimulus to his creative talent (with base in the motivation, the ingenuity and the organization), at the time that to serve as reference to the solution of similar situations in communities different from those of his initial area of action. The present work appears as aim, to discuss limits that will allow the management of innovativeness in the universities, taking as a reference the experience of the Commission Eureka, of the National University Experimental "Rafael Maria Baralt".

INTRODUCCIÓN

Un escenario de compromisos, riesgos e incertidumbre constituye el contexto en el cual se ven obligadas a operar las organizaciones. Aunque los elementos sigan siendo los mismos, el ritmo, la complejidad y el dinamismo hacia formas, realidades y valores completamente nuevos, son de una magnitud jamás antes

experimentada y serán condiciones permanentes para el futuro. Ante esta situación, el reto será sobrevivir y desarrollarse con equilibrio, para lo cual los conocimientos y prácticas adquiridas, jugarán un papel preponderante ante los cada vez más exigentes cambios impuestos por el medio ambiente; enfrentarlos, mejorar, planificar y hasta aprender, son actividades que afectan a todos los participantes activos en la vida de las instituciones. Las universidades están llamadas a cumplir tres funciones básicas: La generación de conocimientos mediante el desarrollo de investigaciones; la transmisión de conocimientos a través de la educación y formación de talento humano de altísima calificación; y la transferencia y difusión del conocimiento, participando activamente en la resolución de problemas de la sociedad. Como organizaciones forjadoras de saberes y entes gestores del talento con la necesidad y obligación de captar y desarrollar ideas capaces de brindar soluciones concretas a sus clientes más cercanos, tanto internos como externos, deben tratar de crear, innovar y materializar en hechos ciertos, productos con base en la motivación, el ingenio y la organización, que puedan convertirse en solucionadores de situaciones a problemáticas de alcance social.

Propósito Del Trabajo

En las universidades latinoamericanas se desarrollan procesos investigativos que generan conocimientos sustancialmente vinculados con las problemáticas de la región, que finalmente no llegan a materializarse en nuevos o mejorados productos o procesos que transformen los resultados económicos, sociales o ecológicos del contexto para los que se investigaron, en otras palabras no se convierten en innovaciones; de allí que en este momento existe un intenso debate acerca de los modelos que deberán implementarse para que las universidades puedan convertirse en centros capaces de gestionar actividades de innovación.

Para el caso venezolano, una modalidad de relación entre la generación de innovación en la universidad y el entorno, es a través de la realización de proyectos de investigación o tecnológicos financiados por el sector productivo o realizados en conjunto. La Universidad Nacional Experimental “Rafael María Baralt” (UNERMB), como ente público, tiene el objetivo fundamental de formar el talento humano que responda a las exigencias del mercado laboral de la Costa Oriental del Lago de Maracaibo – COLM (estado Zulia, Venezuela); no obstante su labor se ha expandido hasta diversos ámbitos relacionados con la problemática social. Una de las formas que ha adoptado la institución para atender a estas necesidades, es a través de la participación de sus estudiantes en la generación de respuestas concretas con soluciones innovadoras para diversas circunstancias, estimulando su talento creativo y al mismo tiempo motivando su participación en eventos tanto nacionales como internacionales, con la intención de difundir sus creaciones, al tiempo que servir como referencia obligada a la solución de situaciones similares en comunidades diferentes a las de su inicial ámbito de acción. Para este fin la UNERMB cuenta con la Comisión Eureka-Unermb, cuya misión consiste en descubrir y desarrollar el talento creativo de los estudiantes en diferentes áreas como: social, técnica, desarrollo sostenible, salud, arte, recreación y diseño. El propósito del presente trabajo es mostrar la gestión llevada adelante por la Comisión Eureka – Unermb a través de formas sistematizadas de trabajo creativo.

Fundamentos Teóricos

Creatividad – Innovación – Gestión De Innovatividad

Se concibe la creatividad como la dimensión humana capaz de generar y desarrollar nuevas ideas, pertinentes y relevantes a partir de sus procesos de pensamiento. Es un concepto abierto que implica la múltiple generación de ideas para el abordaje de una situación particular. En cuanto al término innovación, se apoya en diversas concepciones teóricas que tienen como común denominador establecer una distinción entre creatividad e innovación. Toda innovación comienza con ideas creativas; se inicia pensando algo nuevo de valor; sin embargo, innovar es hacer que eso que se pensó tenga un valor agregado diferencial. Así, la creatividad es el punto de partida necesario aunque no suficiente, para

generar una innovación que implica la generación de la integración, la combinación o síntesis de conocimientos en productos, procesos o servicios originales, relevantes y valiosos. La gestión de la innovatividad se verá entonces como una función que busca integrar las instancias internas y externas a la universidad, en la construcción de un cuerpo de conocimientos basados en la capacidad investigativa y actitud emprendedora de los estudiantes para la solución de problemas del contexto social, científico y tecnológico.

Sistematización De La Gestión De Innovatividad

El trabajo de la Comisión Eureka – Unermb se inicia con un proceso de acompañamiento al estudiante desde el momento mismo del surgimiento de la idea. Sin darse cuenta “el innovador”, va cumpliendo diversas etapas del proceso creativo tal y como las define Rodríguez (1993): cuestionamiento, acopio de datos, incubación, iluminación, elaboración y comunicación, cada una de las cuales posee características bien definidas, como son:

Cuestionamiento: En esta etapa se produce el nacimiento de la idea, cuando el innovador aplica una serie de procesos que comienzan con la observación y los procesos sensoriales. En este momento hace un diagnóstico de la situación y se prepara para la búsqueda de la información.

Acopio de datos: Para poder darle forma a la idea, el investigador recopila datos y la información necesaria para nutrir su idea y comenzar con el procesamiento de la misma.

Incubación: De manera inconsciente, la mente del innovador procesa toda la información recabada y ocurre un periodo de aparente inactividad, pero de conexiones neuronales impresionantes, para dar paso a la idea.

Iluminación: El surgimiento de la idea es un proceso espontáneo y es el inicio del proceso de cristalización en la mente del innovador.

Elaboración: En este punto ya se tienen definidas las acciones concretas que se realizarán para elaborar la propuesta innovadora. Muchas veces son productos inéditos y otras parten del mejoramiento de lo ya existente.

Comunicación: Una vez que el innovador ha concluido la elaboración del producto o innovación, debe darle visibilidad. En la Universidad Nacional Experimental “Rafael María Baralt” (UNERMB), el proceso creativo se vislumbra de forma espontánea y diferente en cada estudiante. El trabajo de la Comisión Eureka-Unermb es facilitar el desarrollo de este proceso.

Descripción De Las Áreas Temáticas Que Agrupan Los Proyectos Creativos Generados Por Los Estudiantes De La UNERMB.

Los proyectos desarrollados a lo largo de 14 años, se han ido agrupando de acuerdo a las áreas temáticas que van surgiendo:

Innovatividad Económica: referida a propuestas que resultan en la resolución de problemas que impliquen ahorro y que redunden en la optimización de los recursos.

Innovatividad Social: En esta área se ubican los proyectos destinados a lograr un impacto positivo ante los problemas que aquejan a las comunidades.

Innovatividad Técnica: Referida a soluciones que impliquen definir conocimientos que permitan generar

propuestas, tales como la fabricación de productos que contribuyan al desarrollo del sector industrial.

Innovatividad Arte Comunitario: Representa el área de conocimiento que acoge todas las ideas que generen propuestas referidas a las expresiones artísticas de cualquier género en las comunidades.

Innovatividad en Desarrollo Sostenible: Se incorpora como respuesta a las interrogantes sobre la conservación del planeta, generación de energías alternativas, ecología y ambiente en general.

Innovatividad en Salud: Esta área incluye proyectos elaborados con el propósito de mejorar el estado físico y emocional de los seres humanos, así como las áreas públicas y ocupacionales.

Innovatividad en Diseño, Arte y Recreación: mención que resulta de la combinación de tres áreas bien diferenciadas; la recreación como medio de aprendizaje y enseñanza, el arte como expresión artístico-musical y el diseño de propuestas. Desde el año 1998 la Comisión Eureka ha fundamentado el ejercicio de sus funciones en valores que le han garantizado su permanencia en el tiempo. A través de su trabajo de captación y seguimiento, ha generado en el estudiante un sentido de pertenencia, confianza y compromiso para el desarrollo de sus ideas.

Consideraciones Finales

A través de los años y de la labor de la Comisión Eureka – Unermb, la universidad inició su despegue en ascenso hacia el fortalecimiento de la investigación universitaria, teniendo como eje transversal, la gestión de la innovatividad y el desarrollo del potencial creativo estudiantil. 176 proyectos innovadores, 277 estudiantes participantes, 58 premios, presencia en 11 diferentes eventos nacionales e internacionales; son resultados concretos obtenidos por la Comisión Permanente Eureka – Unermb, en 14 años de trabajo creativo dentro de la institución. Tres veces representantes de Venezuela en Alemania a través del Premio Bayer encuentro juvenil ambiental y en la Feria de Ciencia, Tecnología y Cultura Innovadora de los Países Asociados e invitados del MERCOSUR; estudiantes ponentes en Congresos Internacionales de Creatividad e Innovación; protagonistas en eventos organizados por instituciones Públicas y Privadas de Educación Superior del país, Ministerios de Ciencia y Tecnología, Cultura y Educación Universitaria.

Muchos retos y obstáculos se han presentado en el camino durante estos años, pero el profesionalismo y ejemplo de constancia, han prevalecido ante las adversidades. La Comisión Eureka-Unermb hoy le dice a su Casa de Estudios Superiores que sí es posible lograr el éxito; solo hay que desearlo y trabajar con perseverancia para obtener un verdadero “Milagro Creativo”...

Felicidades UNERMB Por Tus 30 Años Y Que Dios Nos Permita Seguir Siendo Protagonistas De La Institución Que Queremos...

ABSTRACT

The School of Business Administration and Accounting, University of Coahuila Campus Torreon has applied a Model of Education of Professional Formation centered in Professional Skills. The model has improved and has been optimized according to the demands of business and society, cultural change and pedagogical innovation applied by the university, communication, knowledge and learning. This paper is a description of experiences drawn from implementation of a teaching-learning process that combines classroom training and e-learning environment using the Moodle platform. It also addresses the perception on the impact in both students and tutors and its application in the skills-centered training, the monitoring of program accomplishment and evidence portfolio. The paper adopts the approach of assessment of teaching performance. Furthermore, it offers an assessment of technical criteria related to access, contents and seizing of opportunities offered by the Moodle platform. The study is based on a stratified sample by professional career, six-month terms and curricular axes.

INTRODUCTION

Universities are busy to improving the teaching-learning process by using information technology and communications (ITC) as educational technology, for many advantages they have in the efficacy of the process of generation, transmission and dissemination of knowledge for the benefit of society. One of these tools are the Virtual Environments for Teaching and Learning (VET/ L), which is a space for communication and collaboration that organizes, implements and monitors the teaching-learning process, further facilitating knowledge management, motivation, interest, self-control, and the formation of feelings that contribute to personal development. One way to achieve improvement and the effectiveness of learning through the use of the virtual platform is through evaluation. Evaluation is the process of collection, systematization and analysis of information collected, and the utility is given. In fact, the main purpose of evaluation is not to demonstrate anything, but to improve.

Evaluation is the process of identifying, useful and descriptive information about the value and merit of the goals, planning, implementation and impact of a particular object, in order to provide guidance for making decisions, solving liability issues and promote understanding of the phenomena involved (Shinkfield and Stufflebeam, 1987). The information collected should provide a panoramic view of the current situation under evaluation, and the elements to make a value judgment to intervene and improve the educational process. Therefore, the central idea of this paper is to evaluate the experiences in the use of the Platform Moodle as a Learning Management System LMS in a teaching-learning process. This paper departs from the basis of this form of learning inspired on constructivism; it presents a study of evaluation systems within the constructivist context. It then explains the method used to obtain process and evaluate the perceptions of students and teachers about the use of the digital learning platform. Various control procedures and the results obtained are shown that were applied in two ways: by the answers provided by students and faculty to surveys conducted, and by observation of the contents and activities that are managed by teachers and the level of activity by students. The information generated served as support

for decision making about learning strategies for students, training systems and performance evaluation of teachers, improvement of technological capabilities for the service, among others. That is to say, the paper identifies the strengths and weaknesses of this system in a particular context. A conclusion is presented at the end.

E-Learning Environment And Constructivism

The organization of a teaching - learning processes within virtual environments is an educational process that aims to develop the ability to learn, from the creation of specific conditions that favor it, supported by the use of ITC. Although there are different definitions of Virtual Environment for teaching - learning (VE T/ L), most authors agree in a group of major components: space, students, teachers, learning materials and the strategy for the development of teaching-learning process (SAP). One of the key differences among authors is the emphasis on information technology environment or tool and/or the potential as a space for communication and social interaction mediated by technology.

Trends In E-Learning Virtual Environments

There are several trends in research and development of these virtual environments. (Adell, J., Castell, J. Pascual, J, 2004; Noa L, 2004). Some of them are: a) The integration of VET/ L with management systems of teaching and students, creating what is called an MLE (Managed Learning Environment). b) The separate management of contents and their creation, distribution and integration into didactic units, motivated by theories about learning standardized objects: reusability, aggregation, metadata, free distribution, inter-institutional collaboration, etc. c) Concerns centered in the pedagogical aspects of teaching and learning online, as can be seen in the development of modeling languages or learning design (EML and IMS Learning Design). d) The rapid expansion of open source environments, which have contributed to increase the educational quality and sophistication of these environments and their great flexibility and capabilities of integration. e) The development of collaborative work, not only in terms of student learning in their interaction with their own teachers and fellow students, but also in academic networking and team development of training tools, in which everyone assumes a distinct role.

Third Generation For Integrated And Intelligent Virtual Environment For Teaching – Learning

According to some authors (Adell, J., Castell, J. Pascual, J, 2004; Castaneda, E, 2002), three elements must be taken to measure the functionality a FSC / C: a) Teaching Flexibility: Ability to add value to different learning processes. Usability: It should be: easy to use, simple, intuitive, comfortable and friendly to both teachers (such as course creators, promoters of participation and communication and academic information managers), and the students (as main players in their own training). Technological flexibility: the base technology must be taken into consideration as regards the viability of the platform. Estrada et al (2007) incorporate two more dimensions: a) Fully integrated: technological, pedagogical, methodological and didactic coherent and consistent. b) Intelligent: You must have the ability to learn to use and adapt to the characteristics of students and teachers and environmental conditions.

The Moodle Management System

Moodle is a course management system, mounted on free software that helps teachers and students through online learning. Also known as Learning Management System (LMS), it has a friendly interface easily adaptable to the iconic identity of the school, it is open to many usage possibilities, it has great flexibility that allows the teacher to design a specific space with the complexity and modality required by any specific course.

Approaches To Education And The Educational Model Based In Skills Applied At The Facultad De Contaduría Y Administración Torreón (FCA)

The educational model of skills-based training (CBT) implemented in FCA, is based on the integration of constructivist, functionalist, behavioral and socio-humanist approaches, supported with the use of digital platforms, aimed at training in skills, in order to create a learning process led by autonomous and self-regulating students. The output is an effective professional performance, and participatory, respectful, collaborative and purposive citizens. In the development of skills for life personal relationships, interpersonal and intercultural relationships are of vital importance, including the use of new information technologies and communication. A behavioural approach is one that focuses on memory, it is based on academic knowledge of the professions and the transmission of acquired and stored knowledge. In behaviorism learning is behavioral change that is done through associations created by stimulus-response mechanisms. Behaviorism began in the nineteenth century and flourished during the twentieth century in the industrial age in which the efficiency and effectiveness mass production was paramount. Constructivism explores the problems of how people actively build knowledge based on prior knowledge. Constructivism is a confluence of three basic paradigms based on different epistemological roots, developed over the twentieth century and whose contributions have been imported to the field of education: a) The cognitivist paradigm. b) The psychogenetic constructivism. c) The sociocultural or socio-historical paradigm.

The Role of Evaluation

The purpose of evaluation is making judgments based on the collected information to support decision making aimed at improving the whole process (Stufflebeam and Shinkfield, 1987). It is therefore necessary to collect enough information for evaluation, and it must be varied and relevant, on the learning process of students. This requires different tools according to the development of skills always privileging knowledge, but allowing also to recover skills and attitudes that students put into motion as they face a particular activity. There are three main forms of assessment: diagnostic, summative and formative. The goal of authentic evaluation is that both students and teachers obtain important and relevant information about the development of complex knowledge and skills during the teaching process. It focuses primarily on processes rather than outcomes (Ahumada, 2005), mainly on the performance of students (Díaz-Barriga, 2006). An authentic evaluation consistent with the development of skills encompasses the purpose of evaluation (What?), the purpose (Why?), the context (Where and in what circumstances?) and the process of collection, systematization and analysis (How?).

An important aspect of skills-based training is the assessment of learning by using a virtual portfolio of evidences. The features of evaluation design pointed out by Coll (1999) from a constructivist perspective may be valid for evaluation by skills, including: a) To design assessment activities to measure the degree of significance of student learning. b) To convert assessment in a learning phase, which involves designing assessment activities with different situations and degrees of complexity. c) Consider different levels of learning depth achieved by the students. d) The effectiveness of the evaluation is in direct proportion to the assistance provided to students during their learning process. e) Evaluations should not present any unpleasant surprises, evaluation will allow students to detect how to clearly demonstrate their skills f) Use the observed degree of progress of the student's responsibility to design specific activities that may make it explicit. g) Always relate the contents of the evaluations with the contents of the actually performed teaching-learning process. h) Design aids and self-assessment mechanisms to be used by students to facilitate them achieve self-regulation of their learning process. Evaluation allows matching the construction and/or development of skills for each content item, with the performance criteria for its effective implementation, by means of pre-defined evidence linked to the solution of problems within a given context. All this performed from diagnostic, summative and formative perspectives.

METHODOLOGY

The methodology applied in this research is descriptive and is based on the collection and analysis of data which take place when it is necessary to find solutions for problems in educational organizations, government, industrial or political. The data were extracted from a selected sample. Issues about the processes are posed: experience over time, the changes that may be in stages and phases. As sources of data and techniques we used interviews, participatory observation, and surveys.

Learning Assessment Committee: This Committee was created to meet the need to increase control and analysis on the teaching-learning process in our school. This Committee performs various controls. This paper will focus on two of them: The first control, which is performed to determine the quality in meeting the objectives of the courses taught through what is called Report of Teaching Performance Evaluation. The second control is drawn from the use of the Moodle platform, both by students and teachers. Evaluation Report to the Department of Teaching Performance Evaluation (DTPE) is applied regularly, and it contains an analysis of: Class hours imparted, Group Section; Program, Teacher's File Number and Name, Course taught, Initial and End Dates of the Course. Student's criteria through satisfaction surveys: Values and Attitudes of the Teacher, Teaching-Learning Strategies, Didactics, Teacher's criteria about Syllabus accomplishment.

RESULTS

As an illustrative example of how the School maintains systematic control upon a group of indicators, Table 1 shows the results of the records of 309 observations of courses - teachers from the Bachelor in Public Accounting (BAPA) program from March to May, 2011. The results scored by the students are:

Table 1: Evaluation of BAPC students about their teachers.

	Score 0 to100
○ Values Imbued Attitudes of the Teacher	87,3
○ Strategies for Teaching and Learning	88,3
○ Didactics	88,6
○ Subtotal	88,6
○ Monitoring Syllabus Progress	85,5

Table 2 are records 218 observations of course - teachers in the Bachelor of Business Administration (BBA) with a specialization in Marketing from March to May 2011. Results scored by the students:

Table 2: Evaluation of BBA-M students about their teachers

	Score 0 to100
○ Values Imbued Attitudes of the Teacher	86,8
○ Strategies for Teaching and Learning	87,8
○ Didactics	88,1
○ SUBTOTAL	88,0
○ Monitoring Syllabus Progress	85,1

Table 3 records 100 observations of course - teachers teaching for the degree in Business Administration with a specialization in Production BBA-Pro from March to May 2011. Results scored by the students are:

Table 3: Student evaluation of teachers BBA-Pro

	Score 0 to 100
○ Values Imbued Attitudes of the Teacher	87,2
○ Strategies for Teaching and Learning	87,6
○ Didactics	87,8
○ SUBTOTAL	88,0
○ Monitoring of Syllabus Progress	85,1

As in the three previous tables, the results of the assessment of students on their teachers do not show differences between students in different tracks. These surveys are made by the DTPE by means of a technique of observation and simple random sampling codified beforehand which establishes the number of students to be interviewed to obtain a maximum error of 10%. Each of the evaluated aspects is broken down so that students just make a selection. For instance, the variable "Values Imbued Attitudes of the Teacher" is interpreted through the following indicators: positive reaction, negative reaction, inclination to work, location in time and space, use of resources, communication, responsibility, commitment, confidence and productivity and thus it breaks down each of the 4 variables analyzed.

CONCLUSION

Most expectations students had before the implementation of Moodle were that it would help to develop personal, learning, creativity, motivation and organization skills. The level at which they consider these expectations have been met, is high. So far what has been accomplished to date is a positive experience. Low-income students are 95% of the population. They belong to families with average incomes below 6000 pesos a month. This means from the point of view of domestic infrastructure that probably they do not have internet access at home and do not have a PC either. These students make a greater effort in order to access the platform. However, they make use of computers and internet access at the school itself in out of class time (80%) or they may access the Internet at a Cyber Cafe (20%) incurring in additional costs. Some teachers do not have an adequate preparation in the use of computer equipment and software so their use of the platform has been hampered. They emigrating to other areas of education less intensive in informatics tools giving way to a new generation of ITC literate younger teachers in this School. Students recognize that academic achievement is a PM strength as they have had better results. Creativity is too deemed a strength as this kind of teaching method promotes entrepreneur spirit related to modern current activities. Functionality too is a strength, as the tens of thousands of registered events of access to the system shows, because PM is a friendly system that simplifies the execution of assigned activities. Teamwork and organization could be deemed as weaknesses, especially in the first two years. Another weakness is that some teachers do not use the platform, thus limiting the quality of their teaching.

THE EFFECT OF EUROPEAN FIRMS' INNOVATION CAPABILITIES AND EXPERIENCE ON THE CROSS-BORDER ACQUISITION PERFORMANCE: INTERACTION EFFECT OF THE RELATEDNESS

YonJin Suh, Yonsei University
JaeJoon You, Yonsei University
PhilSoo Kim, Yonsei University

ABSTRACT

Due to the integration of the European market, the globalization process and rising importance of technological innovation surge cross-border acquisition (CBA) strategy for European firms. Innovation and technology is the main driving force behind firms' acquisition imperatives through their innovative capabilities to realize sound performance. Based on the organizational learning perspective and an empirical study, our research focuses on the effects that innovative capabilities and experience has on the acquisition performance of European firms that acquired United States firms through innovative capabilities and experience. The results indicate that both innovative capabilities and experience has a positive effect on the acquisition performance of firms. This indicates that in order to have successful acquisition performance, European firms need to reinforce their innovative capabilities and commit to accumulating experience in CBA. In addition, we discuss the interaction effect that relatedness has on the acquisition performance of European firms. Our findings indicate that related acquisitions associated with commitment and redundant similar innovative capabilities and acquisition experiences that hinder enhanced acquisition performance. The results suggest that relatedness has a negative moderating effect on acquisition performance.

INTRODUCTION

Merger and Acquisition has long been a profound strategy for firms to initiate strategic growth and expansion (Shimizu, Hitt, Vaidyanath, and Pisano, 2004). Acquisitions represent a significant strategic choice with global activity of firms over the last decade (Boeh, 2011). As the globalization of business radically occurs, it is evident that firms confront opportunities of growth through cross-border acquisitions (CBAs). The increasing globalization of business has heightened the opportunities and pressures for firms to engage in CBAs (Hitt, Ireland, and Lee, 2000). The recent decade has proven that unprecedented levels in number of CBAs are continually increasing (UNCTAD, 2011). Typical phenomena observed with the current acquisitions streams represents more global attributes with the value of CBAs growing more significant (Bertrand and Zuniga, 2006). However, manifold research evidences suggest that CBAs intended are not highly successful.

In particular, the observations of European M&A designate growth in CBA activities (Sleuwaegen and Valentini, 2006). Scholars have posited that the integration of Europe, introduction of the Euro, the globalization process, and technological innovation are causal factors behind increasing amount of European acquisitions (Petroulas, 2007; Sleuwaegen and Valentini, 2006). Integration of European markets further contributed to the surge in CBAs rendering opportunities to search beyond national borders for promising acquisition partners (Frey and Hussinger, 2011). As CBA activities demonstrate firms' strategic intent to vigorously search for technical inventions and innovation (Cefis and Marsili, 2006), the relationship between innovation capabilities and CBA performance has received escalating attention in the academic literature (Bertrand and Zuniga, 2006; Sleuwaegen and Valentini, 2006; Veugelers, 2006).

Moreover, the strategic management research has generated important findings relevant to acquisition experiences affecting on the performance of CBAs. CBAs are complex events and phenomena which diverge in various dimensions (Zollo and Singh, 2004). European firms' CBA strategies confront uncertainty and unfamiliar preferences that leads to probabilities of acquisition failures (Barkema, Bell, and Pennings, 1996). In order to solve such failures in CBAs, companies must prioritize the development of knowledge and routines necessary for learning (Nelson and Winter, 1982; Nadolska and Barkema, 2007). Padmanabhan and Cho (1999) stressed that experienced acquirers may have developed the skills and capabilities to effectively manage CBAs. Accordingly, acquisition experience can indeed have an effect on acquisition performance (Haleblian and Finkelstein, 1999; Hayward, 2002). Lubatkin (1983) also suggested that a firm with prior acquisition experience may be more adroit to the indispensable structural changes and therefore avoid administrative problems. It is therefore plausible that European firms with dexterous experiences will likely have better performance in CBAs.

Our key research questions based on relevant observations contests in scrutinizing the effects of innovation and experience of European firms acquiring US targets on CBA performance. The intense global competition and technological advances have pressured European firms to adjust their economic organizations and to redefine their core competencies to construct technological assets (Bertrand and Zuniga, 2006). Through the combination of innovation capabilities and accumulated experiences, European firms began utilizing CBAs as strategic methods to acquire new knowledge and innovative capabilities to enhance firm performance (Uhlenbruck, Hitt, and Semadeni, 2006; Vermeulen and Barkema, 2001).

Our research construct is in the following sequence. In the first section, we discuss the theoretical background and our hypotheses about the effect of innovation capability, acquisition experience and the moderating effect of relatedness on acquisition performance. In the second section, we discuss methodology and depict our variables and their measurements. The third section displays the descriptive statistic and hierarchical regression model which demonstrate the results. In the last section, we provide conclusions along with insightful discussions.

LITERATURE REVIEW AND HYPOTHESES

Innovation Capabilities on CBA Performance

It is important to note a shifting agenda connoting acquisitions relevant to gaining accessibility regarding the target knowledge. Vast literatures assert that firms are seeking to learn from knowledge sources beyond the boundaries of their firms (Cassiman and Veugelers, 2002; Veugelers and Cassiman, 1999). Firms have their own knowledge bases (Levinthal and March, 1993; March 1991) which can be expanded through knowledge enhancing investments and acquiring new knowledge (Cohen and Levinthal, 1989; Huber, 1991). Strategically, acquisitions expand and promote exploration which in turn helps firms overcome the inertia and rigidity that results from just exploitation of firm's existing knowledge base (Vermeulen and Barkema, 2001). Accordingly, CBAs are fundamental management strategy to gain competitive advantages (Driffield and Love, 2005) that able accessibility toward foreign technological capabilities and knowledge (Neary, 2007; Kuemmerle, 1999). Innovation capabilities and knowledge bases through CBAs permit possible innovation combinations that potentially increase the chances that a firm will develop an innovation driven performance (Nelson and Winter, 1978; Zahra, 1996). Previous researches indicate that a firm's absorptive capacity is developed over periods of time through firms' own innovation capabilities and acquiring firms' R&D intensity enhances absorptive capacity hence performance (Cohen and Levinthal, 1990; Tsai, 2001). In this vein, the acquiring firms' innovative capabilities are requirements for learning and applying the acquired new knowledge (Bierly and Chakrabarti, 1996; Cohen and Levinthal, 1990, Dutta and Kumar, 2009). Innovation capability intensive

firms constantly strive for prolific innovation capabilities demonstrating propensities to engage in acquisitions for more innovation (Dutta and Kumar, 2009). With this reasoning, we claim that innovation capabilities of European firms assess positive impacts on the acquisition toward US firms expecting high performance.

Hypothesis 1: There will be positive relationship between innovation capabilities of European firms and CBA performance.

Acquisition Experience on CBA performance

The significance of experience and learning in acquisitions has been exploited in manifold organization learning literatures (Cyert and March, 1963; Levitt and March, 1988; March, 1991; Nelson and Winter, 1982). Firms acquire experience via being exposed to past events, activities, and capabilities (Zahra and George, 2002). Acquiring firms gain experience from prior engagements in acquisitions. Based on the organization learning theory, researchers assert that prior experience develops the absorptive capacity of the firm by providing past investments and routines repertoire that assists firms in recognizing and selecting targets and successfully implementing the integration process (Barkema and Vermeulen, 1998; Cohen and Levinthal, 1990; Nelson and Winter, 1982). Nadolska and Barkema (2007) suggested that acquisition experience was crucial in the success and survival of CBAs. Padmanabhan and Cho (1999) stated in their research that experienced acquirers develop the skills to effectively manage CBAs. Similarly, other researchers have found a positive relationship between acquisition experience and CBA performance (Bruton, Oviatt, and White, 1994; Fowler and Schmidt, 1989; Hitt, Keats, and Demarie, 1998). Therefore, it is expected that acquisition experience and the created routine through strategic activity will enhance the performance of the acquiring firm.

Hypothesis 2: There will be positive relationship between acquisition experience of European firms and CBA performance

Moderating Effect of Relatedness on CBA Performance

Relatedness refers to the extent of similarity in strategy and compilation of resources and knowledge a target firm has compared to an acquirer (Jemison and Sitkin, 1986). The views against relatedness contend that in related acquisitions firms become limited to targets that are similar in resources and have similar R&D patterns (Harrison, Hitt, Hoskisson, and Ireland, 1991; Wolpert, 2002; Higgins and Rodriguez, 2006). This has high potential for resource redundancy between the combining firms (Zollo and Singh, 2004) which results in lower returns from prior investments in already existing resources (King, Slotegraaf and Kesner, 2008) consequently having adverse effects on acquisition performance. Relatedness between firms will weaken the innovative capabilities of a firm with the limitations of providing novel and innovative resources (King *et al.*, 2008) and new knowledge (Ahuja and Katila, 2001; Cloudt, Hagedoorn, and Kranenburg, 2006) concerning other markets and industries. Consistently, Gregoriou and Renneboog (2007) found that relatedness does not play a significant role in better acquisition performance in the case of the European firm studies. Related acquisitions are likely to be diminutive when firms in the same industry possess highly comparable intangible assets. Therefore, we assert that the moderating effect of relatedness aligning with the innovative capabilities impede CBA performance of the European firms.

Hypothesis 3a: Interaction effect of innovation capabilities and relatedness of European firms has a negative impact on CBA performance.

Organizational learning theory suggests that when executing complex organizational tasks such as acquisitions, experience diversity (Hayward, 2002; Huber, 1991; Zahra and George, 2002) are crucial for

performance implications. Diverse experiences provide rich inferences about the causes of acquisition performance (Cheng and Van de Ven, 1996; McGrath, 2001) and provide better solutions when problems related to acquisitions emerge. Beckman and Haunschild (2002) posit that CBA implementation is very complex business processes which requires heterogeneous experiences and found more effective learning between firms occur when the acquiring firms interact with firms that have experience in implementing diverse types of acquisitions. However, related targets tend to provide firms with redundant and similar experience to that of an acquirer lacking the diverse skills and knowledge required for better acquisition performance (Levinthal and March, 1993; Hayward, 2002). Firms tend to make inferences from a narrow range of acquisitions (Levinthal and March, 1993) causing firms to erroneously generalize previous acquisition experience. Acquisitions with related firms hampers exploration of novel markets and capabilities that renders vulnerability to competitors whose acquisitions coevolve with markets and change from new and diverse experience (Leonard-Barton, 1992; Penrose, 1959). Therefore, we posit that relatedness aligning with the acquisition experience will have a negative relationship in terms of acquisition performance.

Hypothesis 3b: Interaction effect of acquisition experience and relatedness of European firms has a negative impact on CBA performance.

METHODOLOGY

Sample and Data

Cross border acquisitions of US firms conducted by firms from the EU 27 were collected through the Thomson SDC database for the period of 1993 to 2007. Both the acquirer and target firms that were in the public status were selected for our data. Our sample consists of 220 cross-border acquisition transactions of 146 acquiring firms from 12 European countries. While most other research mainly focuses on either the United Kingdom or just a specific European country, our data covers acquisition transactions of various firms from a multitude of European countries. We maintain that the collected empirical data will contribute to current research in the context of CBA.

Dependent Variables

Cross-border acquisition performance was measured through the return on assets (ROA) of acquirer firms. Bromiley (1986) states that measures of ROA is suitable for research because firms rely on accounting performance measures when formulating and initiating strategic action such as acquisitions. Taking into consideration the long-term effects of knowledge transfer and integration for innovation in post-acquisition, consistent with research of Singh and Zollo (1998) and Zollo and Singh (2004) our research renders to empirically the acquiring firm's profitability as post three years ROA. Zollo and Singh (2004) have used ROA to assess effects of acquisition experience and Miller (2006) utilized ROA as dependent variables to test for the effects of relatedness on acquisition performance. The ROA data was collected from the COMPUSTAT database.

Independent Variable

We measured innovation capability based on R&D intensity. Research contends that R&D intensity has a high level of effect on innovation (Hagedoorn and Duysters, 2002). Previous researches have demonstrated R&D intensity as a measure for innovative capabilities (Bierly and Chakrabarti, 1996; Cohen and Levinthal, 1990; Dutta and Kumar 2009; Tsai, 2001). We posit that R&D intensity is an appropriate proxy to measure innovative capabilities. In our research, R&D intensity was defined as R&D expenditures divided by total sales. R&D intensity of European acquiring firms for the three years prior to acquisitions was collected from the COMPUSTAT database. As for acquisition experience, consistent

with prior research, it was measured by the number of acquisitions conducted by focal firms (Halebrian and Finkelstein, 1999; Hayward, 2002; Hitt *et al.*, 1998; Nadolska and Barkema, 2007; Vermeulen and Barkema, 2001; Zollo and Singh, 2004). We assessed the number of recent acquisitions undertaken by the acquirer firm three years prior to transaction year. The data on acquisition experience was collected from the Thomson SDC database.

Moderating Variable

Business relatedness refers to similarities in markets and industries in acquisition transactions (Homberg, Rost, and Osterloh, 2009). The statistical data for this variable was inputted utilizing the SIC codes which reflect the primary line of business for acquirer and target firms of the firms involved in the acquisitions (Halebrian and Finkelstein, 1999; Homberg *et al.*, 2009). Utilizing the 4-digit SIC code obtained through the Thomson SDC database, we classified the acquisition as related if the 4 digits were identical and unrelated acquisitions if the digits differ. If the acquirer and target firms were in the same industry sector, we coded that acquisition transaction as one meaning “related”. If they do not, we coded that transaction as zero meaning “unrelated”.

Control Variables

Several factors were controlled for analyzing CBA performance. Firm size was measured by the total assets of acquirer and target firms. This variable was controlled because larger firms tend to have higher ROA or R&D intensity due to their size (Hayward, 2002; Nadolska and Barkema, 2007). We also operationalized the R&D intensity as innovation capacity; however Lev (2001) measured innovation capability by intangible assets as a proxy, while other researchers measured innovation capacity by expenditures on intangible assets (Arundel, Lorenz, Lundvall, and Valeyre, 2007). Due to this conflicting view, we controlled the intangible assets of acquirer and target firms as they can pose an influence when measuring innovation capacity by R&D intensity. The R&D intensity of U.S. target firms was controlled in order to assess the effects of the innovation capacity of European acquiring firms on CBA performance. Makri, Lane, and Hitt (2010) stated innovation capabilities are particularly crucial in high-tech environment. Therefore, we assumed that the effects of knowledge integration on post-acquisition performance in high-tech industries and controlled the acquirer and target firms in the high-tech industry as a dummy variable. The information was collected from the Thomson SDC database and we gave firms in the high-tech industry a score of one, and those in the non-high-tech industry a zero.

RESULTS

The hierarchical regression analysis was used to examine our hypotheses (Cohen, Cohen, West, and Aiken, 2003). The control variables were entered first, followed by the independent variables, innovative capabilities and acquisition experience in step 2. Relatedness was entered in the third step and finally in step 4 the interaction term was included in order to discern the moderating effect of related-unrelated acquisitions. As our hypotheses assume interaction terms based on relatedness between the acquiring and target firms a regression analysis is appropriate when analyzing these effects (Aiken and West, 1991; Jaccard, Turrisi, and Choi, 1990). The hierarchical regression analysis has been utilized before in other researches such as the one conducted by Sarala and Vaara (2010) and Casal and Fontela (2007) to analyze the impact of independent and control variables in CBAs, and distinguish between direct and interaction effects.

Table 1 presents the descriptive statistics of the empirical analysis. Table 2 reports the results of the hierarchical regression analysis to test the hypotheses. Multicollinearity was checked for the variance inflation factor (VIF) (Aiken and West, 1991), which evaluates the extent to which the relationships among the independent variables inflate the standard error. As a result we found that they were all lower

than 10 (Neter, Kutner, and Wasserman, 1990) which state that there is no problem in implementing the regression analysis. In step 1 where the effect of control variables were tested we found that except for whether the acquirer was in the high-tech industry, all other control variables were insignificant suggesting that an acquirer's acquisition performance is independent to variables such as the assets of the participating firms or innovative capability of the target. Step 2 presents support for Hypothesis 1 and indicates that an acquiring firm's innovative capability is positively related to the acquisition performance ($\beta=.164$; $p<0.01$), thus we posit a firm's innovative capabilities are of crucial importance ($\beta=.164$; $p<0.01$) for successful acquisition performance. Step 2 also examines Hypothesis 2 and reports evidence that an acquiring firm's acquisition experiences has a positive and significant effect on performance ($\beta=.190$; $p<0.01$). To verify Hypothesis 3a and 3b about the moderating effect of the relatedness on acquisition performance an interaction term was added in step 4. Step 4 represents the full estimation of our research and as shown in the table, innovative capability and acquisition experience of the acquiring firm continue to be significant in the proposed directions. The results from step 4 supports that moderating effect of relatedness through a regression analysis of the interaction between independent and moderating variables to the dependent variables (Baron and Kenny, 1986). Moderating effect prevail if the increment of F (ΔF) and the interaction term was significant, which is consistent with other CBA research (Casal and Fontela, 2007).

Table 1: Descriptive Statistics and Correlation matrix

ACQ ROA	.02	.00	.224**	.134*	-.143*	-.062	-.115	-.041	.272**	.095	.253**	-.043	1

This table represents the mean and standard deviation and correlations of the independent and dependent variables.

In step 4 we can see that compared to step 3 and the increment of F (ΔF) was 10.336 and significant ($p<0.01$). We find support for H3a, as the interaction between the degree of innovative capabilities and relatedness exists, and its impact on CBA performance statistically and negatively significant ($\beta=-.241$; $p < 0.05$). We contend that relatedness has negative moderating effect on the relationship between innovative capabilities and an acquirer's performance. As depicted in the Figure 1 while in unrelated

acquisitions when the acquirer's innovative capabilities (R&D intensity) increased, acquisition performance (ROA) increased as well. Whereas in terms of related acquisitions even if the acquirer's innovative capabilities increased there was no change in acquisition performance. The results prove that relatedness can function as a moderating variable in terms of an acquirer's innovative capabilities and acquirer's performance.

Accordingly the empirical evidence shows that the interaction term of an acquirer's acquisition experience and the acquirer's ROA is also negatively significant ($\beta = -.237$; $p < 0.05$). This supports H3b that relatedness will have a negative moderating effect on the relationship between an acquirer's acquisition experience and acquirer's performance. As shown in Figure 2, as an acquirer's experience in related acquisitions is higher the acquirer's performance is decreased, whereas in unrelated acquisitions, an acquirer's performance increased substantially when the experience increases. Therefore this proves that relatedness can be a moderating variable in the relationship between an acquiring firm's experience and acquirer's performance.

This table shows the hierarchical regression analysis of our research. ***, **, and * indicate the significance at the 1, 5 and 10 percent levels and can be shown as * $p < .10$, ** $p < 0.05$, *** $p < 0.01$. The total number of the sample was 220 and the Durbin-Watson was 1.424

Figure 1: Moderating effect of relatedness between R&D Intensity and ROA

Figure 2: Moderating effect of acquisition experience between acquisition and ROA

Figure 1 shows the interaction effects of relatedness and R&D intensity on acquisition performance. In unrelated acquisitions, acquisition performance substantially increases along with the acquirer's innovative capabilities compared to related acquisitions. Figure 2 shows the interaction effects of relatedness and acquisition experience on acquisition performance. In related acquisition the acquirer's performance is decreased according to experience whereas in unrelated acquisitions, an acquirer's performance substantially increased as experience increases

CONCLUSION

The Maastricht Treaty and the establishment of the European Economic and Monetary Union contributed to the integration of the market. This along with increasing globalization and surging importance of technological innovation attributed to the number of CBAs dramatically increasing in the case of Europe. In our study we focused on the acquisitions of US firms by European firms from a period of 1993 to 2007. Based on the organizational learning theory and evidence from our empirical study we assessed the influence of innovative capabilities and acquisition experience of the acquiring European firm to its acquisition performance. The results show that European acquiring firms with higher innovative capabilities and prior acquisition experience have a positive impact and result in superior acquisition performance. We delved deeper into account whether the relatedness between firms plays a moderating role in CBA performance. The results indicate that relatedness has a negative and significant interaction effect on acquisition performance. Our research contributes to the current literature as it provides a European acquisition lens of study on that complement previous literatures on acquisition research that tended to focus on US or UK. To the best of our knowledge, we provide insights into how European CBA relatedness with the US firms can have negative effects on acquisition performance. This suggests that European firms should be cautious when deciding whether they should engage in related acquisitions though considerations of innovation capabilities and prior experience seems to be positively certain.

CONTRASTING THEORETICAL GROUNDS OF BUSINESS PROCESS MODELING AND SERVICE BLUEPRINTING

Jukka Ojasalo, Laurea University of Applied Sciences

ABSTRACT

The purpose of this article is to examine and contrast the theoretical grounds of modeling business processes in general and service blueprinting. Modeling typically aims at developing an explicit representation of part of reality to understand, to change, to manage, and to control that part of reality. Service blueprinting is a mapping technique for visualizing service systems. The existing literature includes plenty of knowledge of modeling and service blueprinting, however very little knowledge exists of their similarities and differences. Clearly, there is a need to contrast the theoretical grounds of these two streams of literature. The present article responds to this need. The article is based on an extensive literature analysis on modeling business processes as well as on service blueprinting. First, this article discusses the general principles of the modeling of business processes and systems. Then, it discusses service blueprinting, which can be understood as a specific type of a business process modeling tool developed for services context. As a research implication, this article contrasts several aspects of modeling of business processes in general and service blueprinting. The results of this study help in understanding the characteristics and applicability of both fields. They also facilitate the exchange of ideas between the two research areas.

KEYWORDS: Modeling, Service blueprinting, Business process, System

INTRODUCTION

Modeling business processes and systems has attracted a great deal of interest of researchers. It has a long history and a large number of applications. Modeling has been widely used, for example, in the area of organizational and business process development, as well as in information systems and services design (Will, 1975; Dolk and Konsynski, 1985; Applegate, Konsynski, and Nunamaker, 1986; Geoffrion, 1987; Raghu, Jayaraman and Rao, 2004; Danesh and Kock, 2005; Sun, Zhao, Nunamaker and Sheng, 2006; Damij, 2007; Frye and Gullledge, 2007; Turetken and Schuff, 2007; Wegmann, Lê, Regev, and Wood, 2007). Kettinger, Teng and Guha (1997), conducted a study in which they examined altogether 25 methodologies, 72 techniques, and 102 tools in business process reengineering. A service blueprint (1984) is map that displays the service process so people involved in providing, designing, and managing the service can understand and deal with it objectively regardless their roles and individual points of view (c.f. Zeithaml and Bither, 2003). Service blueprinting can be understood as a specific modeling technique in the service context. The earlier literature includes plenty of knowledge of modeling and service blueprinting. Still, little knowledge exists of their similarities and differences.

Clearly, there is a need to address this issue and increase the knowledge. The present article responds to this need. The rest of this article is organized as follows. First, this article discussed modeling of business processes and systems in general. Then, it discusses service blueprinting. Next, as a research implication, it contrasts the theoretical grounds of business process modeling in general with the special characteristics of service blueprinting. The contrasting takes place in terms of several aspects. They are the type of process, perspective of model, objectives, perspective of methods, characteristics of methods, and “soft” vs. “hard” qualities. After that, the article draws the final conclusions.

Modeling Business Processes And Systems

This section discusses the principles of modeling business processes and systems (c.f. Ojasalo, 2011). According to Pidd (1999), a model is an external and explicit representation of part of reality as seen by the people wish to use that model to understand, to change, to manage, and to control that part of reality in some way or other. Model is a statement of a problem, characterized by a set of inputs, a set of outputs, and relations between them (Wright, Chaturvedi, Mookerjee and Garrod, 1998). Models are also used for exploring possible consequences of actions before they take them, which can be called “reflection before action” (Boothroyd, 1978). Pidd, (p. 119) describes models by saying that “..a model is a convenient world in which one can attempt things without the possible dire consequences of action in the real world.

In this sense models become tools for thinking. This thinking might relate to one-time events.. Or thinking might concern occasional events.. Alternatively, the thinking might concern routine events.. We also use models as tools for thinking when we try to understand a complex system, even if we contemplate no immediate action.”According to Hammer (1990), a business process is a collection of activities that takes one or more kinds of input and creates an output that is of a value to the customer. It is also defined as structured, measured sets of activities designed to produce a specified output for a particular customer or market (Davenport, 1993). A business process refers to a set of related tasks performed to achieve a defined business outcome (Davenport and Short, 1990). It is network of activities and buffers through which the flow units have to pass in order to be transformed from inputs to outputs (Laguna and Marklund, 2005). Denna, Perry, and Jaspersen (1995) refer to three basic types of business processes:

- *Acquisition/payment.* This type of process includes the activities of acquiring goods and services needed by the organization to perform its functions.
- *Conversation.* This process refers to activities of transforming goods or services from raw material to finished products.
- *Sales/collection.* The sales/collection process includes activities of attracting customers, delivering goods or services, and collecting payments for delivered goods and services.

Curtis, Kellner, and Over (1992) identified four most common perspectives to process models: functional, behavioral, organizational, and informational

- *The functional perspective* illustrates a process by showing what activities are being performed and which data flows are needed to link these activities.
- *The behavioral perspective* illustrates a process in terms of when activities are being performed and how they are performed. It uses, for example feedback loops, iterations and triggers.
- *The organizational perspective* illustrates a process by showing where and by whom activities are being performed.
- *The informational perspective* illustrates a process by showing the entities being produced or manipulated by the process. Entities refer to documents, data, or products.

Luo and Tung (1999) proposed a framework for selecting business process modeling methods. The framework consists of modeling objectives, perspectives of modeling methods, and characteristics of modeling methods. Their framework is described is the following.

- *Objectives of process modeling* include three alternatives: communication, analysis, and control.
 - (a) *Communication.* The primary objective of modeling may be facilitating communication related to modeling. Process designers need to describe existing and improved processes. They

have to agree upon a common representation among themselves. The need to share their knowledge of business processes with other employees. Simplicity and clarity may be the most desired features of a modeling for the communication purpose. *(b) Analysis.* Another objective of modeling may be analyzing and improving existing processes. Identifying the best process requires generating alternative representations, simulating process behaviors, and measuring process performance. *(c) Control.* Managing and monitoring a business process may also be the objective of modeling. Since there are several interrelated processes in the organization, there is need to control process operations, manage process relationships, and audit performance. Modeling methods of automated procedures, multi-level process descriptions, and other sophisticated modeling tools can be used to achieve this objective. The second main element in Lue and Tung's (ibid.) framework relates to perspectives of modeling.

- *Perspectives of modeling methods* consist of the object perspective, activity perspective, and role perspective. *(a) Object perspective.* This perspective emphasizes what is being done. The objects that are being manipulated in the process are followed in the modeling. These objects can be data, documents, or physical goods. Data flow diagram (DFD) is an example of the object perspective approach. *(b) Activity perspective.* This perspective is about how things are done. The modeling methods focus on representation of the activities being performed and relationships between activities. Integrated definition of function modeling IDEF0 (see e.g. Kim and Jang, 2002) is an example of the activity perspective. *(c) Role perspective.* The role perspective focuses on who does what. A business process is modeled by representing roles and relationships between roles. The role activity diagrams (RAD) are an example of role perspective methods.
- *Characteristics of modeling methods* include formality, scalability, enactability, and ease of use. *(a) Formality.* This refers to the question: how formal or precise are the languages and notations of the modeling method? Some methods have a set of well-defined notations and require formal semantics to be strictly followed, while others only have a set of guidelines. Formal methods may be well positioned to provide a more precise representation of a process and have the benefits of well-developed properties for advanced analysis. However, they may also be less flexible in terms of modeling ambiguous processes and human involvement. *(b) Scalability.* This relates to the question: how large and complex a business process can the modeling method represent? Some methods can handle large processes and offer mechanisms that support multi-level representations, while others are best suited for modeling processes that are relatively small in size. *(c) Enactability.* This relates to the question: does the modeling method support automated enactment and process manipulation? Some modeling methods only allow process designers to depict a process in a static state, while others also provide automated tools for process simulation and analysis. *(d) Ease of use.* This relates to the question: how difficult is the modeling method for process designers and other non-technical employees to understand and use? Some methods use simple and easy-to-understand notations such as arrows and boxes, while others utilize more complicated mathematical symbols and formulas. According to Martin and McClure (1985), a good model should provide a good basis for communication, be capable of subdivision, and have a consistent notation.

Willemain (1994) examined professional modelers. He (ibid.) reported on the following findings related to *models, modeling process, and modelers*. The qualities of an effective model, in decreasing order of importance, are (1) validity, (2) usability, (3) value to client, (4) feasibility, and (5) aptness for client's problem. The relevant qualities of an effective modeling process are (1) problem context, for example discovering the real problem, (2) model assessment, for example validation and verification, (3) model structure, for example selection of key variables and elaboration of submodels, (4) model realization, for example prototyping and data collection. The important qualities of a modeler include: (1) the modeler's

mindset, for example creativity, sensitivity to client, and persistence, (2) nontechnical expertise, for example communication and teamwork skills, (3) OR/MS (Operations Research/Management Sciences) expertise, and (4) subject matter expertise. Pidd (1999) suggested six simple principles of modeling. They are as follows.

- *Model simple, think complicated.* Models are simple representations of a complex world. Models should be easy to understand, at least in outline form, and should be easy to manipulate and control. Relatively simple model can support complicated analysis. However, a simple model does not have to be a small model.
- *Be parsimonious, start small, and add.* It is impossible to know in advance how complicated the model should be. The principle of parsimony in modeling means that one should develop models gradually, starting with simple assumptions and adding complications only if necessary. Rather than attempting to build a final model from scratch in one effort, one can make initial assumptions that are known to be too simple, but allow proceeding in the modeling. Then, one will refine the initial far-too-simple model over time until it is good enough and fits for its intended purpose. One should deliberately develop a series of models, each more complex than its processors. The modeler build models that are too simple and, when their limitations become too obvious, throws them away and builds another to overcome some of the limitations. Through a series of prototypes, the modeler gradually ends up to a model that fits the original purpose.
- *Divide and conquer, avoid megamodels.* Developing a set of small (interrelated) models is often most useful when a large model is needed. According to Raiffa (1982, p. 7), “Beware of general purpose, grandiose models that try to incorporate practically everything. Such models are difficult to validate, to interpret, to calibrate statistically and, most importantly to explain. You may be better off not with one big model but with a set of simpler models” (Raiffa, 1982).
- *Use metaphors, analogies, and similarities.* Modelers can seek an analogy with some other system or an association with some earlier work. The modeler relies on his own or somebody else’s previous experience. The idea is to search for previous well-developed logical structures similar to the problem at hand. Analogies are most useful in the early stages of modeling.
- *Do not fall in love with data.* Some people assume, that because a model is a representation of some system, examination of data from that system will reveal all they need to construct the model. Such an assumption may be a mistake, even though exploratory data analysis is useful. The availability of user-friendly software packages for data analysis may also make people to imagine that modeling is primarily data analysis, preferably with lots of data. However, modeling should drive data collection, not the other way round. One should first think about the type of model that might be needed before attempting large-scale data collection.
- *Modeling may feel like muddling through.* Model building is not a linear process which moves from step 1 to step 2 to step 3 and so on. A pretence that model building is a rational process may create various problems, particularly for beginners. (Pidd, 1999)

Willemain (1994) brought forward four ways for teaching and improving modeling capability. Firstly, *don’t forget craft skills.* “Soft” qualities in modeling were emphasized more than “hard” qualities. “Soft” qualities include creativity, teamwork, and communication skills, while “hard” qualities cover technical knowledge, subject matter knowledge, and OR/MS (Operations Research/Management Science) knowledge. Secondly, *don’t forget model assessment.* Effective models are valid and usable. Thirdly,

don't forget the client. Working and interacting with the clients is important in order to understand the context of modeling problem and to assess the model. Fourthly, *don't forget wisdom.* In addition to understand equations and algorithms, it is very important to open up discussion about important issues of less technical nature, and to do less talking and more listening.

SERVICE BLUEPRINTING

Service blueprinting is a specific type of business process modeling approach developed for services and service innovation. While a large number of methods and approaches have been introduced for modeling business processes and systems in general, very few have been dedicated just for services. The service blueprinting approach that was introduced by Shoestack (1984) is the most well-known and popular in method in the services context (Shostack, 1982, 1984; 1987a, 1987b; Kingman-Brundage, 1989; 1993; 1995; Kingman-Brundage and George, 1996; Kingman-Brundage, George and Bowen, 1995; Gummesson, and Kingman-Brundage, 1991; Fleiss and Kleinaltenkamp, 2004; Bitner, Ostrom and Morgan, 2008; Johne and Storey, 1998). Next, based on the above referred literature, service blueprinting approach is discussed. According to Nyman, Mickelson and Strandvik (2011), service blueprinting, service experience blueprinting, customer scenario mapping, and service story telling are all techniques for understanding the service process. Service blueprinting has the focus on activities and service process.

Service experience blueprinting has the focus on experiences and service process. Service scenario mapping has the focus on customer's process and activities. Service story telling technique has the focus on experiences and customer's process. A blueprint can be regarded as a two-dimensional picture of a service process (Fliess and Kleinaltenkamp, 2004). The horizontal axis represents the chronology of actions conducted by the service customer and the service provider. The vertical axis distinguishes between different areas of actions. These areas of actions are separated by different lines. "Actions" include customer actions, onstage contact employee actions (actions visible to the customer), backstage contact employee actions (actions invisible to the customer), support processes, and physical evidence. "Lines" of a service blueprint include the line of interaction, line of visibility, line of internal interaction, and line of implementation. These lines divide the map into separate zones where the actions of customers, contact employees, and support personnel are placed. (Fitzsimmons and Fitzsimmons, 2006; Zeithaml, Bitner, and Gremler, 2009; Bitner, 1993; Kingman-Brundage, 1989; Kingman-Brundage and George, 1996; Kingman-Brundage, George and Bowen, 1995; Bitner, Ostrom and Morgan, 2008). According to Zeithaml and Bither (2003), "actions" can be characterized as follows.

- *Customer actions.* Include steps choices, activities, and interactions that the customer performs in the process of purchasing, consuming, and evaluating the service.
- *Onstage employee actions.* Encompass steps and activities that the contact employee performs that are visible to the customer.
- *Back stage contact employee actions.* Include contact employee actions that take place behind the scenes to support the onstage actions.
- *Support processes.* They include internal services, steps, and interactions that take place to support the contact employees in delivering the service.

According to Fliess and Kleinaltenkamp (2004), "lines" can be described as follows.

- *Line of interaction* separates the customer action area from the supplier action area. It represents the direct interactions between customer and supplier. Above the "line of interaction" are activities, choices and interactions performed by the customer.

- *Line of visibility* differentiates between actions visible and invisible to the customer, actions and decisions carried out by front office employees are shown above the line of visibility.
- *Line of internal interaction* separates between front stage and back office activities. Support processes, which are necessary for front stage employees in delivering the service, are carried out beneath the line of internal interaction.
- *Line of implementation* differentiates between planning, managing and controlling (management zone) and support activities (support zone). Support activities are directly related to the service process performed by the contact personnel for a specific customer. Management activities are also related to this specific service process but can also be used to direct numerous service processes.

The process of building a service blueprint includes the following phases (Zeithaml, Bitner, and Gremler, 2009).

1. Identifying the service process to be blueprinted
2. Identify the customer or customer segment experiencing the service
3. Mapping the service process from the customer's point of view
4. Mapping contact employee actions and/or technology actions
5. Linking contact activities to needed support functions,
6. Adding physical evidence of service at each customer action step.

Indeed, service blueprinting is a mapping technique for visualizing service systems. It is a holistic method of seeing in snapshot all relevant resources, actors, and activities involved in the service delivery process, which is essentially a dynamic and living phenomenon. It documents all process steps and points of divergence in a specific service. This documentation is carried to whatever level of detail that is needed to distinguish between any two competing services (Bitner, Ostrom, and Morgan, 2008; Shostack, 1984). A service blueprint is a map or picture that portrays the service system so that the different people involved in providing it can understand and deal with it objectively, regardless of their roles or their individual points of view. A service blueprint visually displays the service by simultaneously representing the process of delivery, the points of customer contact, the roles of customers and employees, and the visible elements of the service. It visually breaks a service down into its logical components and depicts the steps and tasks in the process, the methods by which the tasks are executed, and the evidence of the service as the customer experiences it. Service blueprinting is a particularly powerful technique in the services context, since services are essentially customer experiences rather than objects or technologies (Zeithaml, Bitner, and Gremler, 2009). According to Bitner, Ostrom and Morgan (2008), compared to other to other process-oriented design techniques and tools, service blueprints are first and foremost customer-focused approach, allowing firms to visualize the service processes from their customers' perspective.

RESEARCH IMPLICATIONS: CONTRASTING BUSINESS PROCESS MODELING AND SERVICE BLUEPRINTING

As a research implication, next, the theoretical grounds of business process modeling in general are contrasted with the special characteristics of service blueprinting. This is based on the above literature analysis. This happens in terms of a suggested framework (Table 1). The framework pays attention several aspects, such as the type of process, perspective of model, objectives of modeling, perspective of methods, characteristics of methods, and existence of "soft" and "hard" qualities.

Table 1: Contrasting Business Process Modeling and Service Blueprinting

Aspect	Modeling Business Processes in General	Service Blueprinting
Type of process	Any business process or system	Service process
Perspective of model	Functional, behavioral, organizational, informational	Functional, behavioral, organizational
Objectives	Communication, analysis, control	Communication, analysis, control
Perspective of methods	Object perspective, activity perspective, role perspective	Activity perspective, Role perspective
Characteristics of methods "Soft" vs. "hard" qualities	Formality, scalability, enactability, ease of use Both "soft" and "hard" qualities	Formality, scalability, ease of use Both "soft" and "hard" qualities

Type of process. The present analysis reveals that, business process modeling literature in general covers any types of processes and systems. Service blueprinting literature, on the other hand, focuses only to services processes. Business process in general is a set of activities that takes one or more kinds of input and creates an output that is of a value to the customer (Hammer, 1990). Service, on the other hand, is defined as a process consisting of series of more or less intangible activities that normally, but not necessarily always, take place in interactions between the customer and service employees and/or physical resources or goods and/or systems of the service provider, which are provided as solutions to customers problems (Grönroos, 1990, 2000). Indeed, service is a process, a business process. However, there are certain characteristics that distinguish services from physical goods.

Thus, service process may be very different from other processes. Goods are tangible, homogenous, their production and distribution is separated from consumption, their core value is produced in factory, customers do not participate in their production process, they can be kept in stock, and they transfer ownership. In contrast, services are intangible, heterogeneous, their production, distribution and consumption are simultaneous processes, they are activities or processes, their core value is produced in buyer-seller interactions, customers participate in the production, they cannot be kept in stock, and they do not transfer ownership (Grönroos, 2000). *Perspective of model.* The general business process modeling literature includes four main perspectives. They are functional, behavioral, organizational, and informational perspective. In contrast, service blueprinting, mainly involves functional, behavioral, and informational perspective. The functional perspective is involved while a service blueprints visually illustrates the service process and shows what activities are being performed in the service. The behavioral perspective is present because a service blueprint shows when activities are being performed and how they are performed. Moreover, the organizational perspective is involved since a service blueprint also shows where and by whom activities are being performed in the service process. The informational perspective is not so strongly involved in a service blueprint, because service blueprints seldom show documents, data, or products being produces or manipulated by the process. The informational perspective, as defined here by Luo and Tung (1999) is perhaps more strongly present in manufacturing and information system processes.

Objectives. The general business process literature involves three objectives. They are communication, analysis, and control. Clearly, service blueprinting includes all these objectives as well (c.f. Gummesson and Kingman-Brundage, 1991; Zeithaml, V. A. and Bither, 2003). A service blueprint facilitates the communication between employees, service designers, and management by visually showing the flow of process, as well as persons involved, and their roles and activities. It facilitates analysis by showing potential weak points of the service process as well as opportunities to improve the efficiency, the use of resources and time. Line of interaction between external customers and employees shows the customer's role and demonstrates where the customer experiences the service quality, thus contributing to informed service design. Line of visibility promotes a conscious decision on what customers should see and which employees will be in contact with customers. This facilitates the service design. Line of internal

interaction clarifies interfaces across departmental lines with their inherent interdependencies. This facilitates continuous quality improvement. A service blueprint stimulates strategic discussion by illustrating the elements and connections that constitute the service. It also constitutes the rational basis for internal and external communication. The analysis of service blueprint identifies fail points, in other words, weak links of the chain of activities, which can be the target of continuous quality improvement. It provides the basis for identifying and measuring cost, revenue, and capital invested in each element of the service. A service blueprint also facilitates control of the service process. It promotes top-down and bottom-up approaches to quality improvement by enabling managers to identify and support quality improvement efforts of employees working both on front line and support functions (c.f. Gummesson and Kingman-Brundage, 1991; Zeithaml, V. A. and Bither, 2003).

Perspective of methods. The general business process modeling literature includes three perspectives of methods. They are object perspective, activity perspective, and role perspective. From these, the activity perspective and role perspective are clearly present in service blueprinting. A service blueprint shows the activities being performed and relationships between activities in the service process. Also, a service blueprint shows who does what by illustrating roles and relationships between roles. The object perspective is not so strongly present in a service blueprint, since the blueprint usually does not show, at least in detail, the data, documents, or physical goods that are being manipulated in the process.

Characteristics of methods. The general business process modeling literature includes four characteristics of modeling methods, namely formality, scalability, enactability, and ease of use. From these characteristics formality, scalability, and ease of use are clearly involved in service blueprinting. Both the structure and building process of a service blueprint are very systematic, strict, and precise. Clear guidelines help in building a service blueprint in a stepwise manner. Also, the structure of a service blueprint itself is very strictly defined, even though it has evolved to some extent over the years. A service blueprint is also scalable. Those who develop the service blueprint may decide the scope of modeling. They may decide how large or small service processes they analyze. They may also decide to delimit their blueprinting effort in certain sub-process. Moreover, there is a clear intention to ease of use in service blueprinting. The service blueprint does not include any complex mathematical symbols or formulas. Instead, it is composed of simple boxes, arrows, and zones. Also, developing a service blueprint does not usually require any sophisticated technical or mathematical expertise. However, enactability is usually not strongly present in service blueprinting. Automated process manipulation and simulation are not usually discussed in the service blueprinting literature. Still, it can be anticipated that, due to the increasing influence of ICT, this characteristic will be more strongly present in service blueprinting as well.

“Soft” vs. “hard” qualities. The general business process modeling literature refers to “soft” and “hard” qualities in modeling. They both are required in service blueprinting as well. Analyzing the service process and building the service blueprint is a systematic process requiring analytical approach. Thus “hard” qualities are needed. But also “soft” qualities are essential. Often, service blueprinting effort is team work that requires communication and inter-personal skills, as well as creativity.

CONCLUSIONS

The purpose of this article was to examine and contrast the theoretical grounds of modeling business processes and service blueprinting. The earlier literature includes plenty of knowledge of modeling and service blueprinting. Still, very little knowledge exists of their similarities and differences. Clearly, there was a need to contrast the theoretical grounds of these two streams of literature. This happened in terms of an extensive literature analysis on modeling of business processes in general as well as service blueprinting. As a research implication, this article contrasted the theoretical grounds of business process modeling in general with the special characteristics of service blueprinting. The contrasting took place in terms of several aspects, and they were type of process, perspective of model, objectives, perspective of methods, characteristics of methods, and “soft” vs. “hard” qualities.

EXAMINATION OF ETHNIC AND POLICY ISSUES IN GROOMING PREFERENCES AND ETHNIC HAIRSTYLES OF AFRICAN AMERICAN WOMEN IN CORPORATE AMERICA

Angela Renee Payne, Argosy University – Chicago, Illinois

Bharat S. Thakkar, Argosy University – Chicago, Illinois

ABSTRACT

For a century, college-trained, professional racial minorities: specifically, African American women with a preference in grooming methods have contributed to the labor market; however, in the new millennium, they are often discriminated against, scoffed at, isolated, and demoralized based on ethnic hairstyles. Research studies have distinguished a depth of research on this and conversely there are limited studies on racial minorities, in particular among grooming preferences in ethnic hairstyles. Studies have shown that in progressive companies, racial minorities and African American women who wear ethnic hairstyles had their employment terminated with prejudice. With regard to these case studies and findings, one could argue that in this nation there is freedom of speech and inequality in expression. For this reason, this research is very necessary to discover variables in ethnic and policy issues in grooming preferences with regard to the ethnic hairstyles of African American women as it relates to employers, whereat cohesive practices in diversity and policies address imposing construct in the labor market. This research will not address every ethnical concern in the labor market; yet, it responds to a call in the literature to define managerial deficiencies against racial minorities: in particular, African American women in grooming preferences.

KEY WORDS: African American Women, Hair Grooming, Corporate America, Ethnic Policy

JEL CODE: M20, M21, M38

INTRODUCTION

Chapter 2: The review of literature is designed to specifically address the ethnic and policy issues in grooming preferences experienced by racial minorities and African American women specifically as they continuously worry about navigating others' interpretations of their professionalism and competence (Rosette & Dumas, 2007) as covered in Chapter One. The review specifically examines stereotypes and biases regarding ethnic hairstyles and grooming preferences. The literature review examines gaps in ethnic and policy issues in grooming preferences (e.g., ethnic hairstyles and lifestyles), along with the varied characteristics that speak to organizational discrepancy. This review also addresses the harsh reality of misjudgements toward racial minorities and African American women's professionalism, competence, sociability, acumen, and commitment (e.g., managerial biases and stereotypes) placed on them in the workplace. The literature review examines trends of policies in grooming preferences for racial minorities and African American women in corporate America. This review of literature focuses on the following themes (a) the impact of ethnic and policy issues for racial minorities and African American women regarding grooming preferences, (b) the impact of unconscious genders biases and stereotypes, (c) the impact of forced assimilation, and finally, (d) the impact of leadership development.

Specific sub-categories of policy issues in grooming preferences experienced by racial minorities and African American women include racial stereotypes and bias during interracial interactions; beauty standards reflect white male dominant paradigms. Specific sub-categories of racial minorities and African American women employment gaps include efficacy of corporate affirmative action and diversity

policies, and developing an oppositional gaze toward the images of minorities and African American women. Finally, specific sub-categories of leadership development trends that are favorable for recruitment of racial minorities and African American women into the workforce include intersectional frameworks to understand the group's racial and gender identities and development, targeted recruiting for personality, cognitive ability, and diversity.

Ethnic And Policy Issues

A body of literature on the analysis of ethnic and policies issues in grooming have continued to evolve whereas thousands of discriminatory complaints by employees are filed yearly. Unprovoked acts of employment discrimination have lessened, only to be substituted by ingenious forms of bigotry such as the accomplishment of corporate policies issues in grooming, make-up, hairstyle restrictions, and clothing requirements (Bandsuch, 2009). These policies present a small sampling of this second generation (Sturm, 2001) of trait discrimination (Yuracko, 2006), the profound resemblance of professionalism or continuation of modern forms of bigotry rooted in corporate image. Consider this legal case: *Yanowitz v. L'Oreal 2005*. The California Supreme Court upheld the plaintiff's right to bring a retaliation claim because she refused to follow a directive to terminate a dark-skinned female retailer and then employ a light-skinned blonde-haired person whose physicality was considered more flattering.

Malos (2007) reported the majority of ethnic and policy issues in grooming are discriminatory. Discrimination claims are presented in two forms: (1) those based on the effects of employer dress codes, grooming standards, or other appearance-based requirements, and (2) those based on the effects of co-worker reactions to or stereotypes about gender-related appearance or conduct for men and women on the job. These forms of discriminatory practices are problematic for racial minorities and African American women for unrelated basis (e.g., lifestyles, or ethnic hairstyles) in appearance requirements. Malos cited the following cases to illustrate discriminatory practices based on bona fide occupational qualification (BFOQ) as a way to give further details about irrelevant grooming policies:

Gender-differentiated dress codes, grooming standards, and other appearance-based requirements have typically escaped the general rule that under Title VII, explicit differences in treatment based on sex are discriminatory and impermissible. Unless justified with the extremely narrow bona fide occupational qualification (BFOQ) exception: *Kelly v. Johnson 1976*; *Philips v. Martin Marietta Corp. 1971*; *UAW v. Johnson Controls, Inc. 1991*; *Wilson v. Southwest Airlines Co., 1981*. Regulations include the limitations or exclusion germane to hair length, hairstyle, uniforms, jewelry, and body piercings.

Unfortunately, under Title VII, of the Civil Rights Act, abovementioned regulations have limited judicial "immutable characteristics," as origin and ethnicity for protected and non-protected groups. Even so, the courts ruled that racial minorities and African American women have the capability to assimilate; however, the unambiguous differences in treatment based on sex are discriminatory and impermissible unless justified within the extremely narrow bona fide occupational qualification (BFOQ) exceptions (Bandsuch, 2009). Consider these legal cases to illustrate BFOQ: *Baker v. Cal Land Title 1974 and Harper v. Blockbuster 1998 [hair length]*, *Booth et al. v. Maryland Dept. of Public Safety 2003 [dreadlocks]*, *Cloutier v. Costco 2004 [piercing and body modification]*.

The courts further ruled that ethnic and policies in grooming to address both men and women *Cloutier v. Costco 2004 [piercing and body modification]*; *Wisely v. Harrah's 2004* are characteristically viewed to be *prima facie* (i.e., at first sight referring to lawsuit or criminal procedure) discriminatory under Title VII, and thus sustainable only if based on a BFOQ (Bandsuch, 2010). As, in *Frank v. United Airlines 2000*, the Ninth Circuit Court held that flight attendant weight restrictions limiting women to a stricter standard than men (i.e., physicality) were impermissible: [A] sex-differentiated appearance standard that

imposed unequal burden on men and women is disparate treatment that must be justified as a BFOQ (e.g., *City of Los Angeles v. Manhart 1978*) (Malos, 2007).

Title VII Of The Civil Rights Act

Title VII of the Civil rights Act of 1964, 42 USC 2000e, makes it unlawful for an employer to hire or discharge any individual, or otherwise to discriminate against and individual with respect to his/her compensation, terms, conditions or privileges of employment, because of an individual's race, color, religion, sex or national origin. This covers hiring, firing, promotions and all workplace conduct.

Congress' clear intent was to ensure equal employment opportunities for all people by prohibiting policies and practices that are prejudicial to historically mistreated groups (*Griggs v. Duke Power Co., 1971*), especially racial minorities and African American women (Vinovskis, 1990). Bandsuch (2009) stated Title VII has accomplished part of the goal by significantly reducing much of the overt racism, sexism, and other "isms" that existed in 1964 when the Civil Rights Act was passed. However, in the fiscal year 2009, Equal Employment Opportunity Commission (EEOC) reported the highest annual number of claims filed. This meant that ninety-five thousand, four hundred two chargers of discrimination were alleged. These statistic levels were well above any prior year. Seemingly, unequal treatment in employment pre-exists, imminent in new forms (Fox, 2006) calling for the re-examination of standards.

Unconscious Gender Biases And Stereotypes

Perceivably, the nature of discrimination has noticeably changed since its inception in 1964 that mandated the protection of racial minorities and African American women from intentional discrimination, while concurrently restricting employment opportunities concealed in its subtle nature (Lee 2005). Yet, there is a rapidly increasing body of social science literature that has empirically established the existence and prevalence of unconscious gender biases and stereotypes (p. 482). Lee found this behavior tied to an individual cognitive process for receiving and storing data whereas biases towards ethnic groups to occur at the point of the receipt of new information as an introduction, or interaction with another group. Arguably, these are opposing behaviors by dominant groups in the labor market who may consciously or unconsciously use physical traits that are irrelevant to employment criteria as a proxy for job-pertinent attributes with characteristics like intelligence, honesty, loyalty, and (Mahajan, 2007) competence. Categorizing racial minorities and African American women in this manner is trait discrimination (Bandsuch, 2009).

Forced Assimilation

As courts refuse to award summary judgments in disparate treatment claims of racial minorities and African American women, these groups continue to struggle to meet the preferred professional images. These preferred professional images are driven by negative stereotypes and social norms in the labor market that are predisposed to run counter to racial minorities and African American women's cultural values, which reward white male dominance, and the outward physicality of women (Rosette & Dumas, 2007). Further, they found that the physicality of African American women is much too complex to demand complete assimilation (e.g., body types, skin tones, length of their hair and textures). Furthermore, African American women do not have the luxury of mere preferences; a historical lens that includes negative stereotypes and biases, and lowered expectations colors their choices (p. 421). Consider this case, as an illustration of unconscious bias *Thomas v. Eastman Kodak Company*. The First Circuit Court asserted that Title VII, prohibits disparate treatment because of race extended both to employer acts based on conscious racial animus and to employee decisions based on stereotyped thinking or other forms of less conscious bias. To summarize the case, the employee alleged that her employer's decision-making process regarding her termination included the considerations of low performance

evaluations that could not be reconciled with her high sales record, meaning the decisions were influenced by unconscious bias and stereotypes. Robinson-Moore asserted the unending “color caste systems” that denoted skin tone, long over shorthair, ethnic over euro-hairstyles, lifestyle, and body types is more repulsive now than during the era of Reconstruction. With the prevalence of being racialized and gendered, minorities and African American women are judged by their socialization and socioeconomic status more than any other group. They are coerced to ask themselves if it is worth the poignant vexation of assimilation in social status versus employment. Where is the dignity and equality in forced assimilation? Yoshino (2002) argued enforced assimilation is the contemporary form of discrimination by which racial minorities and African American women remain the most vulnerable. The only answer is social norms are rhetorical behaviors that perpetuate bigotry and intergroup hostility (Green, 2008). The point is, neither African American women nor other minorities should be restricted from the freedom to express culture. To alter the essence of one’s identity, when pressured to assimilate to the dominant cultural norms of the majority, is naturally going to involve some degree of harm (Yoshino, 2002). Berleant (2003) stated cultural aesthetics in lifestyle, and ethnic hairstyles are the essences of a particular culture identity. To end with, Berleant states that racial and cultural identity shapes the life of people and gives that life meaning and significance.

Cokely (2002) revealed that racial minorities and African American women “want to be completely dedicated to their culture without considering other cultures values or beliefs;” “to be who they are and to be proud of it”; “to wear garments, living life, and having dread locks; to wear dreads and froes and be natural.” Foster (2005) stated as a logical outgrowth of the Civil Rights Movement, regardless of race all rights should be protected, whereas justice stipulates companies ignore existing racial categories, even when to do so may perpetuate racial inequities (Blum, 2002). Race and racism continue to operate in various constructs, sequentially yielding racially disparaging discourse throughout the workplace.

Temperaments for policy redundancies provide a false sense of hope; employees are more receptive to proactive methodologies that identify the root cause of institutional practices that perpetuate an alienating and hostile labor market (p.502). Equally disconcerting, Bacchus (2008) revealed that professional African American women’s experiences with work stress are rooted in the social, political, and economic context of the work environment. The causes of stress encountered by professional African American women in the workplace stem from challenges to overcome gender and race discrimination –presented in the form of socially hostile environments (p. 63).

Socially hostile environments combined with negative stereotypes lead to stigmatization and isolation. Professional African American women have had to assimilate to a bicultural (i.e., dual role) posture to repel their high visibility and level of isolation experienced in the workplace. Bacchus defined biculturalism as the assimilation of professional standards and dominant culture values in contrast of behaviors (e.g., grooming preferences) associated with the African American community. To mollify demands made by the dominant culture is stressful, yet professional African American women navigated both these worlds adroitly. Moreover, they found that the level of isolation experienced by African American women in the workplace derived from patterns of social ties existing within the corporate structure. Therefore, the study revealed that African American women were more likely to experience social isolation as they built their career portfolio because of their gender and race identity.

Gaps

Currently Title VII protects employees from discriminatory practices that question African American women’s hire-ability, and social skills. Perhaps, this is how Caucasian males preserve their power of the subordination of the protested classes (Bandsuch, 2009). Crosby, Iyer, Clayton, and Downing, (2003) revealed results from US DOL that Caucasian employees may believe that discrimination has been eradicated, yet, research clearly indicates that equity currently does not exist in U.S. society. Consider

this disturbing distribution of employment: Caucasian employees hold 80% of tenured positions in higher education and 92% of the Forbes 400 executive/CEO-level positions; they constitute 80% of the House of Representatives, 84% of the U.S. Senate, 99% of athletic team owners, and 100% of U.S. Presidents (Sue, 2003), white employees comprise only 33% of the U.S. populations. There is no equality; current behaviors infuse the imbalance of social norms. Hence, the possibility of proclaiming a colorblind society would be to deny historical events. Sue (2004) stated color blindness allows Caucasians to deny the experiential reality of minorities by marginalizing the effects of racism and discrimination, these behaviors promote the power and privilege of being Caucasian in America. Conversely, inequality (e.g., employment opportunities) breeds stereotypical and biased behaviors. Sue (2004) affirmed Caucasians were conditioned and rewarded for remaining unaware and oblivious to how their beliefs and actions unfairly oppress African American women in society (p. 767).

Stereotypes and other biases have the propensity to affect African American women's self-esteem; defined as the proximal mechanism by which racial regard is associated with other components of psychological (i.e. emotional stability) well-being (i.e. life satisfaction and depression). In a theory to test understanding of African American women in racial and gender identities, Settles (2006) stated that African American women were subject to both racism and sexism, sometimes scrutinized more by members of their own social group. These behaviors transcend into public mockery through depictions of hypersexual and licentious women (e.g., Jezebel, Mammy, and Sapphire). The Mammy personality is asexual and nurturing; Sapphire is domineering and emasculating (West, 2004). Researchers have shown that African American women who endorse these stereotypic roles have lower self-esteem than others who resist the stigmas (Thomas, Witherspoon, & Speight, 2004).

At the end of the spectrum, in political circles, Settles found racial minorities and African American women torn between career, women's groups, personal goals and shared mixed emotions about racial identity and gender identities; there was a much stronger desire to "fit in" to seemingly social norms. Settles found racial minorities and African American women had the ability, to assimilate, to reduce negative stereotypes and biases, rather than lose their self-identity. Finally, diversity programming alone will not change the perception of a multicultural workforce. Nonetheless, antidiscrimination regulations are necessary interventions (e.g., affirmative action's compliance, Civil Right Act, Title VII). Companies routinely using these interventions, have increased racial minorities and African American women's share of managerial positions; however, Kalev and Dobbin (2006) asserted that to assess the impact of antidiscrimination legislation on employment inequality, one needs to consider broader political, social and cultural changes associated with the Civil Rights Act, affirmative action, and related laws (Burstein, 2000). On average, companies in the U.S. spent approximately \$15 billion on leader development programs to sustain the effectiveness of these interventions (e.g., Affirmation Action, Civil Rights Act, Title VII, and EEOC). However, if companies only use these interventions as a way to avoid litigations, the probability of effectiveness is diminished; either affirmative action or diversity policies work without the support from senior management and a monitoring committee.

Paradoxically, employers use these practices to protect themselves in court, and the courts, in many cases, accept them as good faith efforts to stamp out discrimination (Edelman et al. 2005). Seemingly, employers are crafty; they incorporate these practices to elude, and inoculate their companies against liability, rather than to increase managerial diversity programs. The study also revealed that disparity in attainment at work is entrenched in managerial bias and the social isolation of women and minorities, a progressive way to improve race relations is only with the intervention of federal civil rights laws that assign organizational responsibility for change (p. 611).

Avolio and Hannah (2008) revealed that leaders are made through life experiences. Either those experiences will create deconstructive or constructive behaviors that can contribute to self-recognition or sabotage leadership development initiatives. They found that leadership development initiatives are more

amenable to followers only when the focal point is the strength of leaders contrasting to their weaknesses (Avolio and Luthans, 2006). This is because followers tend to develop a schema of prototypical leader qualities based on attractive and admired leaders (Ibarra, 2003). These prototypes then serve as a form of idealized behavior that members of the organization would come to identify with over time and be influenced with their own self-construct (Hogg, 2001). This behavior is essential Kark and Shamir (2002) argued self-motivating leaders, followers with a more stable self-identity, higher developmental readiness at critical times reinforce the leader in continuing forward with development, which in turn may further bolster the follower's readiness, resulting in a cyclic reinforcing (Avolio, & Hannah, 2008, p. 342).

Leading Change: Fisher (2005) examined the impact of change within the labor market. He found that when companies support change initiatives, they change their providence. Yet, as the companies implement change, they must not lose sight of those employees within the process who are scrambling to make sense of their new roles. Different responsibilities –influence employee's psychological contract with the company at team and company levels (p. 258). In the study, Fisher found that without complete buy-in to the directions and structure of the change –employees will be less committed to making that change happen. They will exhibit obstructive behaviors towards the change. Fisher states, Human Resource Development practitioners must be intimately involved in establishing unambiguous guidelines to help facilitate the structured change implementation via line management throughout the company to ensure acceptability. Well-established manager-employees relationships reduce the possibility of employees resisting efforts to change; conversely, employees who are accustomed to antagonistic exchanges with their managers may view the use of influence tactics suspiciously and be more likely resist the requested behavior (p. 458). In addition, studies have shown that organizational changes and managerial strictures influence behaviors may be perceived differently across cultures (Fu & Yukl, 2000). For example, employees from ethnically unyielding cultures, characterized by authoritarian relationships, may not be as averse to sanctions or legitimizations as employees may from unethical yielding cultures (Hood & Logsdon, 2002).

CONCLUSIONS

Companies have an ethical obligation to develop reasonable policies for implementation in grooming that act in accordance with Title VII principles. As a rule, grooming policies should have prescriptive (affirmative standards) and proscriptive dimensions (negative restrictions), mandatory and optional provisions (Bandsuch, 2009). In tandem, guiding principles suggestive of conventional business casual or professional attire are usually less problematic than specific exclusions, no ethnic hairstyles, no pendants, or no headscarves' (cultural symbolism). If necessary, specific restrictions should be visibly sustained by a legitimate business explanation, avoid any correlation to protected class identity, and permit employees autonomy as much as possible (p. 339). Theoretically, many companies advocate that assimilation in an effort to increase trust, fairness, loyalty, and performance add to corporate productivity, professionalism, and company image (Roberts & Robert, 2007).

Title VII Synopsis

In one sense, the courts are still looking for the same fundamental elements of discrimination as outlined by the Supreme Court and Title VII (Bandsuch, 2009): (1) Less favorable treatment (material adversity) as to terms, privileges, or conditions of employment. (2) To any of the statutorily protected groups; and (3) Perpetrated intentionally (or unintentionally) because of or based on a protected class (*McDonnell Douglas Corp., v. Green*). In the *McDonnell Douglas Corp. v. Green* that case, the courts allowed the defendant to escape rehiring or paying damages to the plaintiff when presenting a legitimate (non-discriminatory business rationale) alternate reason, but allowing the courts in its discretion, to award declaratory relief, limited injunctive relief, attorney's fees and costs. Nonetheless, negligence into keeping abreast of changing community and industry standards and other important contextual dynamics

that might influence the appropriateness in grooming policy (Conway, 2000) in companies without such efforts, may unintentionally discriminate by enforcing antiquated grooming policies that limit employees opportunities (*Carroll v. Talman Federal Saving & Loan Association of Chicago*). In the aforementioned instances, these companies should be penalized by higher courts harshly. However, the issue is Title VII, from its inception, considered the traditional rights of companies to run their business as they see fit, balancing their autonomy against the prohibitions of discrimination (Bandsuch, 2009, p. 318). Title VII standards delineate that companies might have to pass legitimate scrutiny if they ignore constitutional guarantees like freedom of speech. Bandsuch went on to say "...freedom of religion, privacy, due process, or equal protection. Religious clothing, tattoos, piercings, union symbols, confederate flags, armbands, insignias, pins, and politically charged statements all seem to contain a degree of protected expression."

Protected Class: As a rule, fundamental rights like speech, religion, and privacy may not be impaired unless the governments' restrictions are framed to serve a compelling state interest (*Austin v. Michigan Chamber of Commerce*). For the same reason, the Equal Protection Clauses, instructs that no state shall "deny any person within its jurisdiction the equal protection of the laws" (*U.S. Const. amend. XIV, § 1*). Similarly, the protections and justifiable reasons for restricting them depend on the class of persons impacted as opposed to the classification of the right (Wasserman, 2004). For example, the American Airlines policy potentially influences religion (dreadlocks for Rastafarians), national origin (Native Americans' long Navajo style), race (African American women and men who wear cornrows), and women in general (for various hairstyles) (*E.E.O.C.*). The Fifth Circuit Court recognized speaking Spanish (Mexicans, Latinos, Cubans) and having certain accents may be related to Mexican identity; therefore restricting their use should not be seen as a facially neutral policy (*Garcia v. Gloor*). Facially neutral (no-rehire rule) policies may appear to be reasonable in theory, yet, it is discriminatory in its application. The question is not whether Title VII protects the rights of individuals within the protected class; the question is the manner in which classes are protected (*Title VII, 2006*).

Group identity: In a recent analysis, the researcher found that the restriction on braided hairstyles is problematic for a few reasons: (1) it targets hairstyles typically associated with African-Americans' culture (e.g., cornrows and dreadlocks). Sociological and psychological studies support the view that appearance is quite significant to cultural and racial identity (Patton, 2006): "...Certain braided hairstyles like cornrows serve general are historically shadowed with political, philosophical and ideological overtones (*Dunham v. Pulsifer*). Such a policy, in other works, poses a considerable threat to the group and individual identities of Africa American women, the protected group in question (Bandsuch, 2009)."

(2) Hairstyle restrictions, like many other grooming requirements, are often rooted in White male standards that are imposed upon African Americans. Subjection to these standards can result in covering, assimilation, and stigmatization, which combine to reinforce one of the precise harms; subordination which Title VII was design to eradicate (Green, 2008). In the Black community hairstyle is a primary method for expressing group and individual identity, compromise that in some cases amounts to discrimination (e.g., a no-Afro policy) (*E.E.O.C.*). Add the related ills of stigmatization, essentialism, and stereotype threats within the Caucasian male-dominated system that both implements and enforces archaic grooming rules, and it becomes evident how the labor market, as well as society, can at times appear rather vile (Bandsuch, 2009, p. 322).

Finally, this literature review supports the call for a re-examining of discrimination laws to encompass this undue burden on racial minorities and African American women. Greenberg (2003) stated, "We need to continue to educate courts about how companies mistakenly conflate gender, gender identity and gender role performance." This inappropriate conflation can lead to discriminatory employment practices that, regardless of their form, all constitute discrimination under Title VII (Malos, 2007). Possibly, the integration of leadership models will invalidate adverse impact solutions overtime. There must be an

inclusive commitment for hiring demographic diversity in workforces as an effort to diminish the threats of stereotypical behaviors within an establishment. Furthermore, integration of leadership models supports the assumption that leaders' skills and management styles can be addressed in a culturally receptive establishment to further reduce incidences of unconscious biases.

REPATRIATE ADJUSTMENT AND TURNOVER: THE ROLE OF EXPECTATIONS AND PERCEPTIONS

Pamela L. Cox, State University of New York at Oswego
Raihan H. Khan, State University of New York at Oswego
Kimberly A. Armani, State University of New York at Oswego

ABSTRACT

International placements, particularly of executives, have increased with the globalization of business. Although many global organizations have established procedures to help their employees adjust to their stays abroad, and some have established practices to provide support for returning employees, repatriate turnover continues to be a challenge for organizations. This paper reviews current repatriate adjustment and turnover literature and presents a model incorporating the findings of recent research. The proposed model suggests repatriate adjustment and turnover intentions are related to the following key factors: employee expectations upon repatriation, employee perceptions of organizational repatriation support practices, and employee perceptions of the appropriateness of both job content upon return and the availability of external career opportunities based on the employee's new found expertise.

JEL: M12, M16

KEYWORDS: Repatriation, turnover, international management, reverse culture shock

INTRODUCTION

International placements, particularly of executives, have increased with the globalization of business. The number of foreign assignments has grown at an exponential rate. Multi-national corporations send their managers abroad for a variety of reasons including the objective to develop their knowledge of international economic environments and increase their ability to manage in a global context (Tung, 1998). One way organizations build a pool of global knowledge and skills is to transfer their managers from country to country (Paik, Segaud, & Malinowski, 2003). The foreign assignments can provide first hand understanding of local markets, encourage cross-fertilization of ideas and practices, retain star performers in the organization by providing them with new challenges, and allow organizations to exercise control over their subsidiaries. An assumption is made that expatriate managers will return home with international expertise that will benefit the organization (O'Sullivan, 2002). Global assignments may create competitive advantage for both employees and for the companies that employ them (Carpenter, Sanders, & Gregersen, 2000). Not surprisingly, Stroh and Caligiuri (1998) found that effective management of people in the global arena positively affects the bottom line.

A foreign assignment can be thought of as consisting of three broad stages: 1) selection and pre-departure, 2) the foreign assignment, and 3) repatriation and career management (Bonache, Brewster, & Suutari, 2001). Repatriation is defined as the return to the home country after the completion of an international assignment (Dowling & Shuler, 1990). Researchers and practitioners alike have failed to adequately address the issue of repatriating or re-acclimatizing the employee returning from the foreign assignment. Although many global organizations have established procedures to help their employees adjust to their stays abroad, and some have established practices to support returning employees (Lazarova & Caligiuri, 2001), the final phase in the expatriation process, repatriation, continues to be a difficult phase for both employees and companies (Vidal, Valle, & Aragon, 2008). Repatriates experience a wide variety of issues including organizational change, career transitions, financial and family problems, and psychological stress (Chi & Chen, 2007; Harvey, 1989). In fact, repatriation can present a more difficult adjustment

than expatriation (Forster, 2000; Suutari & Brewster, 2003). Repatriation can be experienced as a shock (Baruch, Steele, & Quantrill, 2002; Paik, Seguad, & Malinowski, 2002) and it can take approximately a year to a year-and-a-half for repatriates to fully adjust (Adler, 1981; Harris & Moran, 2000). If repatriates are unable to adjust, they may leave the organization. In some cases, repatriates leave their company within two years after their return from an international assignment (Black, 1991; Lazarova & Caligiuri, 2001; Kraimer, Shaffer, & Bolino, 2009). When turnover occurs, organizations lose the employees' skills and knowledge including those gained through the foreign assignment (Bossard & Peterson, 2005). With the substantial cost of training and salary for each employee sent abroad, repatriate turnover also represents a substantial financial burden for the organization. According to the 2004 Global Relocation Trends Report, 44% of repatriates leave their companies within the first two years of returning home (Kraimer, Shaffer, & Bolino, 2009, p. 28). Black et al. (1992) found that 42 percent of the American repatriates they studied seriously contemplated leaving their organizations upon returning home, and 74 percent did not expect to be working for the same company in one year. In addition, 79 percent felt they would be able to find another job with another company as the demand for their international skills was high. While international assignments create opportunities to develop international expertise, employees are sometimes placed in jobs upon their return that do not utilize the skills and knowledge developed abroad (Harvey & Novicevic, 2006). The resulting frustration may cause repatriates to seek opportunities that are more rewarding with other firms (Stroh, Gregersen, & Black, 1998). Repatriate turnover may also compromise a company's ability to recruit future expatriates if the turnover signifies to others that international assignments have a negative career impact (Lazarova & Caligiuri, 2001).

Repatriation is a critical phase in the expatriation process. Given the costs and potential negative impacts of employees' failures to adjust following their international placements, this phase requires more scrutiny. This paper reviews current repatriate adjustment and turnover literature and presents a model incorporating the findings of recent research. Recommendations for future research are outlined as well as suggestions for improving organizational repatriation support practices.

LITERATURE REVIEW

Turnover and Intent to Leave

Significant numbers of employees leave in the two years following repatriation. Previous research supports the position that intent to stay or leave the organization is consistently and strongly related to voluntary turnover (Griffeth & Hom, 1988; Mathieu & Zajac, 1990), and has found intent to leave or stay as the strongest predictor of actual turnover (Hendrix et al., 1999; Mowday et al., 1982). Thus, in our proposed model, we use intent to leave or stay (turnover intentions) as a proxy for actual employee turnover.

Organizational Support Practices

The human resource practices of the repatriate's organization may influence the repatriate's adjustment upon return from an international assignment. The following HR practices have been found to facilitate repatriates' adjustment: having a fluent communication system, having a mentor in the domestic organization during the abroad assignment, providing training to employees prior to their return, the compensation package the company offers to repatriates, and how the organization manages repatriates' careers upon return. For example, research has found that an ongoing communication system between the home office and the expatriate reduces repatriate turnover rates (Lazarova & Caligiuri, 2001). Likewise, good communication during repatriation is critical. A qualitative study found that Spanish repatriates complained about the lack of information regarding the content of the job upon return home (Vidal et al., 2007a). There is some evidence that having a mentor during the international assignment may provide security to the expatriate and improve adjustment upon returning home (Harvey, 1982; Tung, 1988;

Swagak, 1997; Hurn, 1999; Vermond, 2001). Conversely, Stroh (1995) found no support for having a mentor and repatriate adjustment. Research indicates that the timing of an HR practice may influence its outcome. Repatriates seem to value training prior to repatriation as a way to reduce uncertainty regarding the repatriation process and help to clarify the job the employee can expect upon repatriation (Black et al., 1999). Training *after* repatriation was found in one study to have no impact on repatriation satisfaction with the repatriation process (Vidal et al., 2008). Thus, it may be critical for training to take place prior to the expatriate's return home. Jassawella, Connolly, and Slojkowski (2004) found that firms that manage repatriation effectively do not simply intervene at the end of the employee's assignment but instead plan much of the repatriation activities before the employee is transferred.

Studies examining the relationship between compensation and turnover have yielded mixed results. On the one hand, Gomez-Mejia and Balkin (1983) found that increased compensation reduced repatriates' turnover intentions. Other studies found no relationship between compensation and repatriate adjustment (Gregersen & Black, 1996) or between compensation and repatriate satisfaction with the repatriation process (Vidal et al., 2007b). The existence of a professional career plan or career management was found to reduce the turnover rate among repatriates (Lazarova & Caligiuri, 2001; Stroh, 1995). Career management was also found to increase satisfaction with the repatriation process (Vidal et al., 2008). Vidal et al. (2008) found that professional career management, clarity in repatriation politics and practices, and accurate working expectations were related to satisfaction with the repatriation process.

Satisfaction with the repatriation process was found to be negatively related to intent to leave the organization. Other studies have supported the findings that professional career management (Hammer et al., 1998; Bossard & Peterson, 2005) and having accurate work expectations (Black et al., 1999; Pickard, 1999) are important to repatriates. Results from studies examining the relationship between how well the repatriation process has been explained and clarified (repatriation practices clarity) and repatriate adjustment have been mixed. Research from the United States and Finland found no support for a relationship between clarity in repatriation practices and repatriate adjustment (Black & Gregersen, 1991; Gregersen & Stroh, 1997). On the other hand, for Japanese and Spanish workers clarity in repatriation practices was related to repatriation adjustment (Black, 1994). Vidal et al. (2008) proposed that cultural differences may moderate the relationship. U.S. and Finnish workers may tolerate uncertainty better than Spanish and Japanese workers. Lazarova and Caligiuri (2001) examined organizational support practices and their effect on lowering repatriates' turnover intentions.

Interestingly, they found that the key issue was not the support practices in and of themselves, but rather the repatriates' perceptions of the support practices. They collected data on HR practices most often associated with successful repatriation programs including pre-departure briefings, career planning, agreement on the type of position upon repatriation, reorientation programs, repatriation training programs, financial counseling, lifestyle assistance and counseling, continuous communication with the home office, visible signs that the company values international experience, and communication about the repatriation process. Repatriation support practices were not found to be related to either organizational commitment or repatriates' intention to leave (or to stay with) their organizations. Repatriates' perceptions of their organization's overall support practices were not related to organizational commitment. However, perceptions of organizational support practices were significantly related to repatriates' turnover intentions. These results indicate that repatriates believe company-wide appreciation of global experience and career-planning sessions are the most important repatriation support practices. These findings further suggest that the most important factors to repatriates are that the organization cares about their adjustment upon return home and has an appreciation for the experience they have acquired. De facto, repatriates' perceptions may be more important than the support practices themselves.

In summary, the researchers found the following to be of particular importance to repatriates: (1) that the company articulated appreciation of global assignments and (2) offered career planning sessions. Not

having these two elements seemed to result in unfavorable attitudes towards the company and increased repatriates' intentions to leave the organization. There appears to be a disconnect between the reasons stated by companies for assigning international assignments (organizational learning, acquisition of global skills, and knowledge of cultural contexts) and the actual transfer of knowledge and utilization of newly acquired global expertise upon the expatriates return to the organization. Based on our review of the literature, we propose the following:

Proposition 1 – Repatriates' perceptions of organizational repatriation support practices are related to turnover intentions.

Repatriate's Job Satisfaction after Returning Home

March and Simon (1958) proposed that employee turnover is related to the perceived desirability of the job and ease of movement. Hulin, Roznowski, & Hachiya (1985) list attractiveness of the current job and availability of alternatives as reasons for employee turnover. Mobley (1977) presented a popular model illustrating the employee turnover process. According to this model, the turnover process starts with an evaluation of the existing job. Next, employees search for, evaluate, and compare alternatives. The turnover process concludes with the employee making a decision to quit or stay. Repatriates appear to go through this process when evaluating the job assigned to them upon repatriation and determining whether to leave or stay with the organization. Repatriates most likely also assess the availability of opportunities outside the organization. In fact, repatriates may perceive the availability of external job opportunities to be quite high. In one study, 79 percent of repatriates felt they would be able to find another job with another company as the demand for their international skills was high (Black et al., 1992). International assignments increase the external marketability of repatriates who may have acquired new skills, language proficiency, flexible management styles, and the formation of a global mindset while abroad (Lazarova & Caligiuri, 2001; Lazarova & Tarique, 2005). International employees tend to receive more external offers of employment from different organizations upon return from their assignment abroad (Lazarova & Tarique, 2005). Furthermore, individuals today may no longer perceive their career as a progression of jobs within a single organization. Instead, they perceive their careers as boundary less, and move from one company to another to pursue the best career opportunities (Parker & Inkson, 1999). These individuals will also tend to be less committed to their organizations, increasing the likelihood that they will leave the organization if job expectations are not met.

The repatriation literature suggests that being assigned a job that utilizes the employee's abilities and knowledge) is related to both job satisfaction and turnover intentions. Unfortunately, companies often do not assign repatriates a job where there is a match between employees' abilities and knowledge and job content and tasks (Bossard & Petersen (2005). In one study, 50% of repatriates found the job they held upon returning home less satisfactory than the one they held while abroad (Hammer et al., 1998). In another study, approximately 60% of repatriates felt their company did not take into account their international skills and experiences when assigning them a job upon repatriation (Peltonen, 1997). Vidal et al. (2007b) found that suitable job content upon returning home was positively related to repatriate job satisfaction. Other studies have found that repatriates often feel that their jobs upon returning home are less satisfying and that their home organizations do not value their international experience (Bolino, 2007; Hammer, Hart, & Rogan, 1998; Stroh, Gregersen, & Black, 1998).

One reason that expatriates may accept an international assignment may have to do with expectations that the assignment will increase their career opportunities (Suutari & Brewster, 2003). Research has shown that expatriates who see a strong connection between their international assignments and their long-term career paths are more likely to stay with their organizations upon repatriation (Lazarova & Caligiuri, 2001; Stroh, 1995). Not receiving a promotion upon return from an international assignment may be perceived as a violation of the employee's psychological contract with the organization (Welch, 2003).

Lower career advancement opportunities within the company (relative to opportunities available outside the company) may be a predictor of turnover intentions (Stahl, Chua, Caligiuri, Cerdin, & Taniguchi, 2009). Poor career planning may result in repatriates being placed in a holding pattern and assigned jobs that may or may not match their abilities and preferences (Harvey & Novicevic, 2006). Vidal et al (2007b) found that being promoted was positively related to repatriate job satisfaction and negatively related to intentions to leave the organization. Having professional career planning available for repatriates has also been found to be related to repatriate job satisfaction (Vidal et al., 2008) and repatriation turnover (Kraimer et al, 2009). Perceived underemployment may moderate the relationship between career advancement and turnover intentions (Kraimer et al., 2009). Repatriates who perceived a promotion following their return home were less likely to experience feelings of underemployment, which, in turn, made them less likely to think about leaving the organization. Accuracy in work expectations may be related to both repatriate job satisfaction and turnover intentions. Expectations may frequently be more optimistic than the reality presented to repatriates upon return home (Pickard, 1999), and this gap may negatively affect job satisfaction (Bonache, 2005). Accurate work expectations have been found to be related to repatriate adjustment and performance (Black, 1991; Black et al, 1999). Accurate work expectations have been found to be related to repatriate job satisfaction and turnover intentions (Vidal et al., 2007b, 2008).

Proposition 2 – Repatriate’s work expectations are related to job satisfaction and turnover intentions. If the repatriate’s work expectations are not met (a violation of the perceived psychological contract), job satisfaction may decrease and intentions to leave the organization may increase. The relationship between job satisfaction and turnover intentions is moderated by perceptions of external job opportunities.

Moderating Variables – Individual Characteristics and Type of Global Assignment

Individual characteristics may moderate a repatriate’s adjustment upon repatriation, his/her perceptions of repatriation support practices, work expectations, and job satisfaction. These individual characteristics may include the following: age, gender, family status, culture, and personality. Age, gender, and family status each have a bearing on the number of problems employees may encounter when they are transferred internationally (Baruch, Steele, & Quantrill, 2002). There is a consensus in the literature that younger expatriates, lacking family responsibilities and significant social commitments, have an easier time adjusting to a new job assignment (although there is also some evidence that the relationship between age and adjustment may be curvilinear) (Feldman & Tompson, 1993). Employees with families have to worry about the readjustment of others beside themselves. Poor adjustment by spouse is a key reason why expatriates return home early from their assignments (Rushing & Kleiner, 2003). An important family concern involves the trailing spouse’s job (Joinson, 1998). Family members accompanying the repatriate on the assignment may also experience reentry culture shock.

Furthermore, spouses’ repatriation adjustment has a positive impact on employee repatriation adjustment at work (Black et al., 1999). The family may also experience considerable pressure from family members who remained in the home country. The extended family may have to learn to interact with family members they have not seen in years, and grieve over missed periods of growth and bonding (Zvara & Singh, 2004). Animosity and blame may be directed toward the repatriate who “put the family in this situation.” One study of Taiwanese repatriates found that the family accompanying the expatriate during the overseas assignment was positively related to the repatriate’s intent to leave the organizations upon return (Liu, 2005). Research has also shown gender can affect success in a foreign assignment, with women being more successful than men (Halcrow, 1999). More research needs to be done to determine the influence of gender on repatriate adjustment and turnover. Previous research has shown that repatriation adjustment problems and repatriate turnover may vary by country. Sixty percent of American expatriates, eighty percent of Japanese expatriates, and seventy-one percent of Finnish expatriates

experience some degree of culture shock upon returning home from a foreign assignment (Black, Gregersen, & Mendenhall, 1999). Participation in the local culture of the host country and a long length of stay may exacerbate problems upon return home. When employees live and immerse themselves in a foreign environment for an extended period, they are likely to adopt patterns of thinking and behaving that are characteristic of the foreign culture, creating stress and readjustment difficulties when they return home (Brislin & Van Buren, 1974). Similarly the greater the length of time a worker is away from home, the greater the chances that changes have occurred in the home country during the repatriate's absence. The value of various repatriation support practices may vary with culture. For example, repatriates from Spain and Japan, cultures that have been found to not feel comfortable when uncertainty appears in comparison with workers from other countries (high uncertainty avoidance), valued "clarity in the repatriation policies and practices" of their firms more than U.S. and Finnish repatriates (from cultures ranked low in terms of uncertainty avoidance) (Vidal et al., 2008). Lee & Liu (2007, p. 127) suggest that Taiwanese expatriates may experience greater culture shock and reverse culture shock due to their collectivist culture. In a collectivist culture, individuals belong to only a few in-groups that are stable over time. These groups tend to be rigid and inflexible, making movement from group to group difficult. Therefore, in a Taiwanese culture, individuals may have difficulty adjusting to shifts in group membership. Taiwanese repatriates may feel very isolated from their in-group colleagues during expatriation, making it difficult to re-establish these relationships after repatriation.

O'Sullivan (2002) proposed a model whereby certain proactive personality characteristics and behaviors may be related to the suitability of the post-return job, repatriate cultural adjustment, and turnover intentions. The proactive personality characteristics include extraversion, conscientiousness, and openness to experience, emotional stability, and agreeableness. The proactive behaviors include social networking and network seeking (both aimed at securing repatriation support and initiated both pre & post return). This model suggests that certain individual characteristics and behaviors may result in better repatriation adjustment and lower turnover regardless of other factors.

The characteristics of the global assignment may also influence repatriation adjustment and turnover. There is some disagreement as to whether the length of the assignment makes a difference. On the one hand, the shorter the period the expatriate is out of the firm's headquarters, the easier the transition to the home country may be (Lazarova & Caligiuri, 2001). Other scholars have suggested that extended assignments are desirable because they allow for better cross-cultural adjustment and improved effectiveness (Tung, 1987). Liu (2005) found no relationship between length of assignment and repatriate turnover intentions. He did find a significant relationship between number of repatriate overseas assignments; those repatriates who had had more overseas assignments and had gone through the repatriation process multiple times, adjusted better upon return. He also found that the longer the time return from the overseas assignment, the better the repatriates' adjustment and the lower the turnover intentions. Kraimer et al. (2009) found that the number of international assignments is negatively related to career advancement upon repatriation, but that this relationship flattens out as the number of assignments approaches four or more. State the authors (p. 40): "Thus, in our study, repatriates were most likely to get ahead in their organization when they had been on only one assignment.

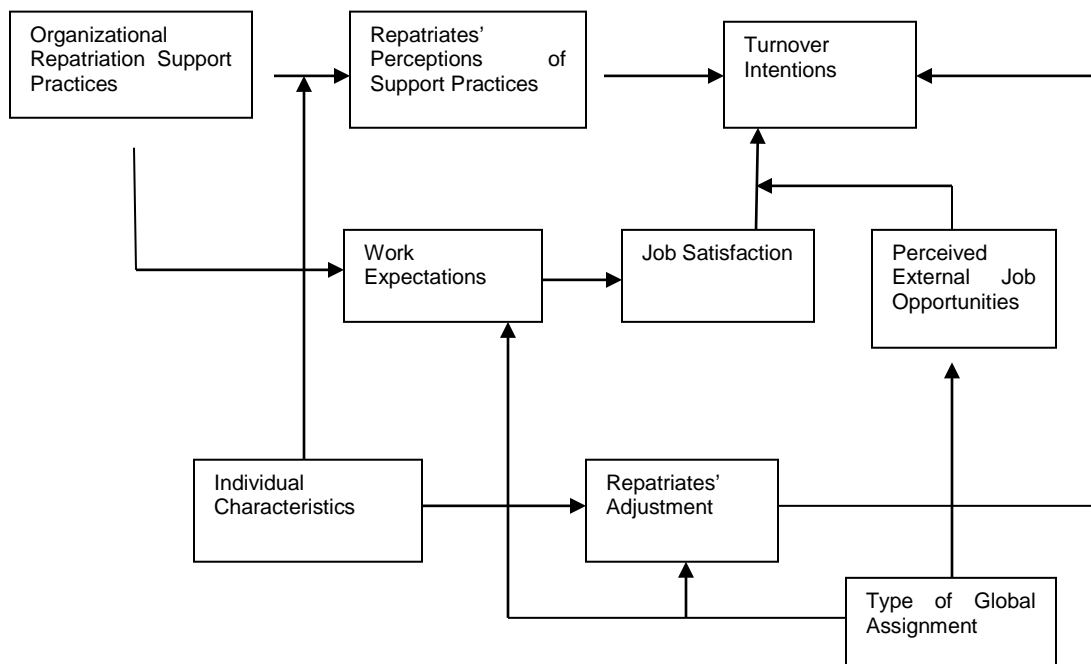

Career advancement was lowest among those who had between two and four assignments, and only after four assignments did there appear to be a non-negative relationship between number of international assignments and career advancement. ... Multiple assignments may damage careers because they are tagged as "out of sight, out of mind" or become thought of as permanent expatriates." Other researchers arrived at similar conclusions (Feldman & Thomas, 1992; Stroh et al., 1998). Stahl et al. (2009) examined the relationship of type of assignment to turnover intentions. They examined developmental assignments (learning-driven) and functional (demand-driven) assignments. Employees sent on developmental international assignments perceived their future career advancement opportunities to be better and were

more inclined to leave their firms than employees sent on functional assignments. Kraimer et al. (2009) found developmental expatriate assignments to be positively related to career advancement.

Proposition 3 – Individual characteristics like age, gender, family status, culture, and personality may moderate repatriates' perceptions of organizational support practices. Individual characteristics may influence the repatriate's adjustment to home. Adjustment to home may in turn be related to turnover intentions.

Proposition 4 – Characteristics of the global assignment (length of assignment, number of assignments, and type of assignment) may influence repatriate adjustment, work expectations, and perceived external job opportunities.

Figure 1: Proposed Repatriate Adjustment and Turnover Model

This figure depicts the proposed model of the causes and effects of repatriate adjustment and turnover intentions.

Questions for Future Research

The antecedents of repatriation are worthy of exploring in more detail. Questions for further research include the following:

- Are repatriates' perceptions of their organizations' support practices more important than the actual support practices themselves? Which support practices are perceived by repatriates as being most critical to their adjustment upon return home? Do individual differences like age, marital and family status, culture, and gender moderate perceptions of support practices?
- How do cultural differences affect repatriate adjustment and perceptions of organizational support practices?

- How does the personality of the employee affect repatriation adjustment? Further research is needed to determine the impact of proactive personality characteristics and behaviors on repatriation adjustment and turnover.
- How do organizational support practices impact repatriate work expectations prior to and after returning home?
- In what way do the characteristics of the global assignment moderate repatriate adjustment, work expectations, job satisfaction, perceived external job opportunities, and turnover intentions?

Practitioner Recommendations

1. Companies need to provide adequate support during both the expatriation and repatriation processes. The following practices seem to be critical to repatriate adjustment: having a good communication system, providing employee training and career planning prior to, during, and after the assignment.
2. Communications systems, employee training, and career planning sessions should focus on creating accurate work expectations. Managing employee perceptions of organizational support practices may be just as important as providing the support practices. Above all, companies need to make sure that they articulate appreciation for global assignments and the acquisition of international skills and experience.
3. Organizations should provide repatriates with jobs upon return home that have suitable content and make use of the skills and experience acquired by the employee during the international assignment.
4. Periodic trips back to the home office to provide training and orientation to the home office staff about the practices of the foreign market could help facilitate knowledge transfer, and show appreciation for the new status and skills of the expatriate. These trips would also allow the expatriate to continue to be a part of the home office.
5. Organizations may want to consider varying support practices with the employee's marital and family status, gender, age, culture, and personality.
6. Organizations may want to consider taking extra measures to ensure the retention of employees returning from developmental assignments as these employees may be more inclined to leave their firms than employees sent on functional assignments.

CONCLUSION

This paper contributes to the repatriate adjustment and turnover literature by reviewing the literature and presenting a model incorporating research findings. The proposed model suggests that repatriate adjustment and turnover intentions are related to the following key factors: employee expectations upon repatriation, employee perceptions of organizational repatriation support practices, and employee perceptions of the appropriateness of both job content upon return and the availability of external career opportunities based on the employee's new found expertise. Our review of the literature suggests there is a gap between employee expectations and reality—in particular, the reality the repatriate experiences upon return home. On the one hand, organizations claim to value international assignments as a way to build a pool of global knowledge and increase the international skills of their employees. On the other hand, many organizations place repatriates in jobs upon their return home that do not utilize the global skills and knowledge acquired during the assignment. There appears to be a disconnect between the

reasons stated by companies for sending employees on international assignments (organizational learning and acquisition of global skills) and the actual transfer of knowledge and utilization of newly acquired global expertise upon the expatriate's return. Halcrow (1999, p. 42) suggests that expatriates may in fact be a "squandered" resource. In addition to proposing a model incorporating repatriation research and providing suggestions for future study, this paper offers recommendations to practitioners for closing the gap between expatriate expectations and reality, and better utilizing repatriates as a valuable organizational resource.

IMPACT OF ICT IN AN TOURISM EMERGE MARKET: SOME IMPLICATION FROM THE CASE OF ALBANIA

Klodiana Gorica, University of Tirana
Kozeta Sevrani, University of Tirana

ABSTRACT

ICT and Internet are very necessary in business life. They occupy a key place for the majority of jobs in business. A business, regardless of type and category of belonging, cannot live long, and cannot survive without IT market. Especially, the tourism industry is closely linked to ICT and the Internet. After entering the Internet and ICT in tourism entrepreneurs, significant changes have occurred. Almost, all structures and plans for development and business management, has changed. ICT and Internet have become tourist entrepreneurs in e-business. The main purpose of this paper is that in addition to evaluating the important role in tourism development in Albania, the evidences and the changes that have occurred in tourism. The purpose of the article, realized not only from theoretical research, but also from conversations with businesses involved in tourism, by comparing the current management that of the previous 10 year progressed.

Key words: IT, internet, tourism development, economy development, SME, marketing, plan and strategy, e-business, e-marketing.

INTRODUCTION

The Internet is the most important innovation since the development of the printing press (*Hoffman, 2000*). ICTs include not only the hardware and software required but also the groupware, network and the intellectual capacity (humanware) to develop, program and maintain equipment (*Buhalis, 2003*). Role of Internet in the tourism sector, tourism is important to "organize themselves" (do-it-yourself), particularly in relation to SMEs. In order to understand how great is the impact of e-business in this segment of the tourism sector, we should note, that the tourist industry, dominated by very small enterprises. The role of small enterprises is very important in the economy. The SME strategy plays a key role in the government's strategic goals for the social-economic development of Albania (*OECD 2003*). Exercising a good marketing by SMEs, across IT and the Internet, is one of the best occasion for local economic development; Once awake the interest of all stakeholders, who are implicated in this scheme. So, for example, in addition to visitors and tourists, the publicity of a tourist area attracts great interest of other investors, who may be domestic or foreign. Increasing investment, bringing employment opportunities for local residents, which means, that provides more income for their families.

Marketing has much to offer the study of entrepreneurship. Marketing and entrepreneurship are traditionally regarded as two separate academic disciplines (*Gerald E Hills; Claes M Hultman; Morgan P Miles*) Also, on the other hand, not to forget the role of local government, an injunction, thus becoming a key manager, to create opportunities and support for all businesses and investors. Local government, affected to increase overall investment in infrastructure, which meets under the tourist area, being more secure, and easily accessible for tourists. Marketing was done through IT and the Internet creates opportunities for economic development especially in remote areas, isolated due to physical and geographical conditions, or left in limbo for a long time, as a result of abandonment by residents. In particular, e-Business, has created opportunities for revitalization and regeneration of rural areas, making tourism will become a major alternative development.

Also, another facility is the fact that entrepreneurships are usually small, have simple web pages, and are easily usable by the clients, unlike large companies, which have numerous links within their web pages. This practical value, is that SMEs, to be the ideal in economic ventures. SMEs are more durable in the market and are easier to be filed by individuals who do not have big capital. Usually, in most cases, remain as family businesses, where all members of the family, contribute to keep the business. The two main factors for conducting successful e-commerce are 'security of the e-commerce system' and 'user-friendly Web interface', thus recognizing that building customer trust and convenience for customers are essential to succeed (*Chulwon Kim 2004*)

LITERATURE REVIEW

ICTs include "the entire range of electronic tools, which facilitate the operational and strategic management of organisations by enabling them to manage their information, functions and processes as well as to communicate interactively with their stakeholders for achieving their mission and objectives (*Buhalis,2003*). According to WTO, the Internet is revolutionizing the distribution of tourism information and sales. Tourism has closely been connected to progress of ICTs for over 30 years. The establishments of the Computer Reservation Systems (CRSs) in the 1970s, Global Distribution Systems (GDSs) in the late 1980s and the Internet in the late 1990s have transformed operational and strategic practices dramatically in tourism (*Buhalis, 2003; Buhalis & Law, 2008*).

For tourism businesses, the Internet offers the potential to make information and booking facilities available to large numbers of tourists at relatively low costs. It also provides a tool for communication between tourism suppliers, intermediaries, as well as end-consumers (*Chulwon Kim 2004*). Nowadays, the Internet and ICTs are relevant on all operative, structural, strategic and marketing levels to facilitate global interaction among suppliers, intermediaries and consumers around the world (*Buhalis & Law, 2008; Egger & Buhalis, 2008*).

METHODOLOGY

To achieve the purpose, several methods are used. Methods of study are integrated in a way that you come to the aid that has the goal page. Studies and current research are focused to discover definitions for the current theoretical concepts. Also, part of the inquiry, have been the review of specific studies for impacts of ICT and the Internet, especially in developing countries like Albania. Obviously such a topic cannot be missing questionnaires, which is best express ideas and opinions of all actors involved in the tourism industry. Questionnaire method is conducted with two groups. The first group is the group of tourist enterprises, while the second groups are tourists and citizens. The questionnaires contain some questions which need to identify in general, the role of ICT and the Internet. In particular, stop to tourist ventures, which reveal the changes they have undergone their businesses over time. 200 questionnaires have included businesses such as villas, hotels, travel agencies, travel agencies, bars and restaurants, resorts, etc.. The second group includes 200 citizens, and tourists have encountered in the tourist areas. The questionnaires were conducted in Korca, Tirana, Durrës, Vlore, Sarandë, Berat, Himarë freelance, including several tourist villages in these areas. Also, part of methodology of work, are also interviews with local government experts, who recently in the area that have turned administer tourism as the main part of local development strategy.

RESULTS QUESTIONNAIRE ANALYZE-CASE STUDY

Questionnaires With Businesses

For the realization of the questionnaire, 200 businesses were selected, distributed all over Albania. Undertakings have over 10 years in the field of tourism, and are mainly hotels, villas, resorts, bars

restaurants, travel agencies etc.. The purpose of the questionnaire, to take stock, not only the role of ICT and the Internet, but also to understand how marketing has changed management and ii enterprises after entry of ICT and the Internet.

1: How long have you set up your business?

- 10 years
- 10-15 years
- Over 15 years

10 years	10-15 years	Over 15 years
5	178	17

Most businesses have 10 to 15 years, operating in the market. This means that those have a long tradition in the tourism industry, and are able to identify changes in their business after the entry of ICT and the Internet.

2: How long have you to use IT / Internet in business?

- 1-5 years
- 5-10 years
- Over 10 years

1-5years	5-10 years	Over 10 years
	180	20

Of the 200 enterprises surveyed, only 20 of them have over 10 years who use ICT and the Internet in their business. The rest, 180 entrepreneurships, have mostly 10 years takeovers. Though these enterprises have over 10 years in the tourist industry market, they have entered later in the so-called e-business.

1. For what do you use ITC and internet?

ICT and the Internet, there is a widely used in all undertakings. In particular, the special place occupied informational portals for different advertisements that undertakings provide to our customers. And the important part is the logistical management of all enterprise. ICT, has great use, even for part of the booking, and general organization of tourist travel, offering several kinds of opportunities for clients.

3: How do you get most of the booking?

- IT/internet
- Telefon
- Contact in office with clients

ICT/internet	telephone	Contact in office
186	10	4

4: How important is the role of IT / Internet in your business?

- Very important
- Important
- Somewhat important

Very important	Important	Somewhat important
200		

For all the businesses, ICT and internet are very important. They explain that is impossible to resist in market and to profit from their business without ICT and internet. 5-Compared with 10 years ago, what has changed since the moment the use of IT / internet? Many things have changed from this time. First of all, the spending for advertising in the media and for people employed for the marketing of the company. Some years before they needed a large number of employments compared with actual number. For example for touristic agencies or travel agencies is enough one office completed with ICT and internet services and the work go on. Also now the entrepreneurship have more connections between them. They collaborate to offer the best services for clients. They have past the borders because the clients are not only local or national but international. Now everything is e-business or e-service. They can serve more client at the same time and their economically profit are larger than 10 years before, because the logistic part is more fast and qualitative. Also we have added new destinations for tourism based on client requests and specially with different prices; so many people can go with holidays.

6:What are the most favorite tourist areas from client?

- Rural areas
- Urban areas

Rural areas	Urban areas
200	

The answers we get from businesses are the same. All prefer more rural area as tourism destination than urbane area. Diversity of rural landscapes and environmental quality, are some of the reasons leading to the preferred choice as a tourist destination. In Albania, recently have always waits and more of a rural tourism, and for more to areas that are remote from large urban centers. Despite the fact that many rural areas, since they are new tourist destinations, not only do not have a good tourist infrastructure, but also the general infrastructure, there is no obstacle for tourists. Currently in Albania, are not only top the list at the seaside villages, but those mountains. These show us the role of ITC and internet, not only to discover new destinations, but also to change the marketing for tourism destinations.

7. Compared with 10 years ago, how have changed the prices for rural and urban tourism areas? Let's say that a reversal has occurred report. Now, in Albania, higher prices of tourism services go to rural areas. Very few, are those who choose to stay, for tourism accommodation or sand and sun in urban areas. More and smaller facilities are required, clean beaches, woodlands in mountain tourism, and above all the traditional services, especially the art of gastronomy. These requirements once came only from foreign tourists, but now the requirements come also from Albanian. It should be noted that requests come from those who have financial opportunities, to cope with prices.

Questionnaires With Citizens

For the realization of the questionnaires, were selected 200 citizen and tourists, encountered in tourist areas, with different age, sex and belonging to different professional and social category. The aim of the questionnaire consists in the fact, to emphasize the role of ICT and the Internet, for the selection of tourist destinations. But besides this, it is also another purpose, which indirectly shows the impact that ICT and the Internet has, in tourist undertakings, revealing that, in its responses and opinions that have citizens on the following matters. Citizens interviewed reveal changes that have undergone tourist ventures, compared with 10 years ago.

1: Are you a regular user of ICT and the Internet?

- Yes
- No

Yes	No
200	

All those surveyed were regular users of ICT and the Internet. They say he occupies a very important place, in everyday life, both for work and study, or even for leisure time, looking for and get information and curiosities.

2: Which is the method you use for selection of tourism destination?

- Internet search
- Telephone to touristic agencies
- Go to office of touristic agencies

Internet search	Telephone to agencies	Go to office of touristic agencies
185	10	5

92% of citizens surveyed use the Internet to obtain information about tourism destinations, and to determine destination for their holidays. Only 5% use the phones, and 3% go to tourist agencies. This highlights the role that ICT and the Internet has in the field of tourism. ICT and the Internet now, it has become indispensable only for tourist ventures, but also for customers who already have the simplest way, and are better informed about tourism destinations and their costs

3: Launched by the IT and Internet services, is easier now to go on vacation, or more complicated?

- Easier
- Not so easy
- No

Easier	Not so easy	No
195	5	

Over 90% now think that going on vacation, is simple, because they have very little time for you booked, you only need a confirmation, and everything else is ready, and we planned to detail, from tourist ventures, which coordinate with each other, starting from transport, to the accommodation in hotels, tourist guides in the field. The other part that says it's not so simple, connecting with the fact that not decides, as a result of multiple destinations and offerings that make agencies.

4- Compared with 10 years ago, what has changed in tourist ventures, after the entry of IT and the Internet? Services are better quality, and above all fast in time. But at the same time, are added, new variations of tourism, the tourism destinations and types of tourism. Now there are many offers that are throughout the year and finds that the reasonable prices.

5: Do you think that IT and the Internet have impact on prices in the market?

- Yes
- No

Yes	No
200	

All think, that has ICT and the Internet, has a strong influence on market prices. All agencies, want to attract as many clients, attempting to find the lowest bids, in order to be as compelling for customers.

Nobody wants to spend more money wasted. They create and same about hotels and resorts, travel agencies or different categories, offering the same destination with different prices.

1. Do you think that IT and the Internet, have affected the quality of tourist services?

- Yes
- No

Yes	No
200	

100% convinced that ICT has a significant impact. Marketing, which is realized through ICT and the Internet, informs enterprising competitors, for services provided by each of them. To them, are always in competition, to enhance the image in the market, increasing quality of services.

RECOMMENDATION

All businesses should have wide use, the IT and the Internet. They constantly need to update web service with new information. Tourism ventures, should communicated with as many other enterprises, integrated in the field of tourism, so that, their bids to be diversified. Between all actors who serve in the field of tourism, there must be a spirit of cooperation for the realization of positive goals. Enterprises should be careful in choosing and defining strategies for e-business. Local governments should support policies present, control and guidance for businesses. Undertakings operating in the field of gastronomy or even accommodation should not only have international and global approach, but in particular traditional even after the special is what defines tourist destination. Tourism ventures should lobby and constantly publish new tourist destinations, as should endeavor to maintain a balance and tourism destinations. In this way will create development opportunities and benefits for all touristic areas. Flexibility in marketing policies is one that will enable not only economic benefits for tourism ventures but also for residents of tourism areas and trying time will rouse interest for tourists who want to explore as many places.

CONCLUSION

ICT and the Internet, has brought a revolution in the tourism industry. Today it is almost impossible to imagine tourist ventures without ITC and Internet services. Values of ICT and Internet in the tourism industry, are always appreciated by many researchers, organizations, entrepreneurs, local government etc.. Use of ICT and the Internet, has brought about radical changes in the tourism industry. ICT and internet has brought facilities for customer service, and logistical management of enterprises. But not only that, ICT and the Internet, have facilitated, and have cut many undertakings address the economic burden for commercials and advertisements and payments for marketing agents. Today, through ICT and internet marketing is provided with a minimum cost, and in many cases free of charge, through social networks. This means that the management of enterprises, after the entry of ICTs and the internet has changed the strategy. In addition to these ICT and the Internet has brought about a better all operators providing services in the tourism industry, bringing better quality services and faster in time and well placed to customers. In this way, even more benefits for themselves, because the range of services, and ever expanding, as in quality, as well as quantity, offering opportunities for all social categories and classes of society. In Albania, currently tourism, has taken an important role in the economy, although the latter is fragile, and not very stable during this transition. Most of tourist enterprises in Albania, are not more than 15 years, a period that enough, for information regarding the benefit of ICT and the Internet.

All enterprises, which have over 10 years in the market, where the focus is to make the article, not only have maintained their balance on the market, but even we are soon introduced a new line of marketing,

which converts economic activity in e-business. Undertakings with long experience in the market are those that clearly testify, the role of ICT and internet in policies of management and marketing trends. Currently the role of ITC in Albania and the internet has brought major benefits, not only to venture into the tourism industry, but also for other actors in society, especially local government, local and foreign investors, as has awakened interest in new destinations tourist previously unexplored by tourists. This is also a very good alternative for economic revitalization, especially in mountainous areas or coastal areas, which until now had remained in limbo

INBOUND INTERNATIONAL TOURISM TO THE UNITED STATES: A PANEL DATA ANALYSIS

E. M. Ekanayake, Bethune-Cookman University
Mihalis Halkides, Bethune-Cookman University
John R. Ledgerwood, Embry-Riddle Aeronautical University

Abstract

The objective of this paper is to analyze the demand for tourist arrivals to the United States, using the panel cointegration technique. The study attempts to identify and measure the impact of the main determinants of the inbound international tourism flows to the United States. The study uses annual data from 1986 to 2011 for tourist arrivals from 50 major countries of origin of tourists. The specified model includes several country-specific determinants. The panel unit root tests indicate all the variables are integrated of order one. The panel cointegrations tests show that all seven test statistics reject the null hypothesis of no cointegration at the 1% significance level, indicating that the five variables are cointegrated. The results suggest that tourism demand to the United States must be considered as a luxury good and is highly dependent on the evolution of relative prices and cost of travel between origin and destination country. The results also show that tourism demand is elastic with respect to income but inelastic with respect to tourism price, real exchange rate, and travel costs.

INTRODUCTION

Tourism industry has emerged as one of the leading service industries in the global economy as well as in the United States economy in recent decades. It is now one of the largest foreign exchange earners in the United States, generating \$434.4 billion or 2.9% of GDP in 2011 (World Travel and Tourism Council (2012), *United States: Travel and Tourism Impact 2012.*), and is a major source of economic and employment growth. Economic flows generated by international tourism have become vital factors in economic growth and international economic relations in many countries. For example, according to the U.S. Bureau of Economic Analysis, direct tourism employment in the United States was 5.41 million and a total tourism-related employment of 7.63 million in 2011, accounting for about 5.5% of total employment. According to the U.S. Department of Commerce, Office of Travel and Tourism Industries, between 1986 and 2011, international tourist arrivals to the United States increased from 25.7 million to 63.2 million, growing an annual average growth rate of 3.5% (see Figure 1). Based on the latest forecast by the U.S. Department of Commerce, the United States is expected to see a 5% annual growth rate in visitor volume between 2012 and 2016, producing 81.5 million visitors by 2016.

Given the importance of travel and tourism industry to the United States, in order to promote tourism, the Travel Promotion Act of 2009 (TPA) was introduced and the new Corporation for Travel Promotion (CTP) was established. The CTP's main goal is to promote the United States as a premier travel destination to international travelers. However, the impacts are expected to be minimal in 2012 and increase as a proportion of normal expected growth through 2014 and then decline through 2016.

North America has been the largest source of tourist arrivals to the United State during the period 1990-2011, though its share dropped from 61.7% in 1990 to 49.3% in 2000 (see Table 1). The three largest regions of tourist arrivals, North America, Western Europe, and Asia, account for more than 85% of total

tourist arrivals to the United State. Eastern Europe and Africa regions record the lowest number of tourists to the United States between 1990 and 2011. Canada, Mexico, and the United Kingdom are the three largest sources of tourists to the United States, accounting for more than 61% of total international visitors in 2011 (see Table 2).

Table 1. International Visitors to the United States by Region of Residency, 1990-2011

The remainder of the paper is organized as follows: Section 2 provides a brief literature review. In Section 3, the empirical framework of the current study is set out by specifying model as well as the econometric methodology. Section 4 discusses the variable definitions and outlines the data sources. Empirical results of panel unit root tests, panel cointegration tests, and error-correction model estimates are presented in Section 5. The last section, Section 6 presents a summary and a brief conclusion as to the results obtained in this study.

REVIEW OF LITERATURE

There are a large number of studies done on tourism demand. Much of the literature in international travel research tends to rely on demand-side theories and models to explain international tourism flows. In its majority, tourism demand research has dealt with demand at the national level, although several studies have addressed demand at the regional and local level focusing on amenities, attractions, events, accommodations, seasonality, ecological concerns, etc. Demand-side studies have dealt with both outbound and inbound tourism demand, with the overwhelming majority of studies focusing on the latter. The main criticism of much of the demand-side literature is that it is excessive in its use of aggregate concepts as well as aggregate measurements, masking the many particularities of complementary destinations (Marcouiller et al., 2004 and Cortés-Jiménez and Blake, 2011).

Efforts at tourism demand forecasting have used both qualitative and quantitative methods, with the majority of studies favoring quantitative approaches (Song and Turner, 2006). Researchers modeling demand have mostly used non-causal longitudinal analysis, causal econometric models, and gravitational techniques. Each of these techniques has merits. The degree to which they lend themselves to accurate demand forecasting, and therefore policy decision making, depends on their ability to accurately measure economic theory tenets. As expected, there is no single technique that is confirmed to be best on all counts over all others (Song and Li, 2008).

Song and Li (2008) in their exceptionally comprehensive study of the tourism demand forecasting literature, report that since the 1970s time-series models have been widely used in the field. Time-series frameworks have used either single equations or systems of equations, with several researchers preferring multivariate regressions. Single equation models, used in earlier studies, tended to use ad hoc approximations to explain flows of bilateral tourism demand and therefore resulted in simplistic, yet, dissimilar findings, only partly accounting for economic theory. Critics suggest that single equation models fail to yield consistent parameter estimates and fail to address demand for complementary and competing destinations (O'Hagan and Harrison, 1984).

Cointegration techniques along with other econometric methods have been used to determine short-term and long-term relationships. "However, the identification of structural relationships is often problematic" (Bonham, Gangnes and Zhou, 2009). While models using systems of equations are more comprehensive than single equation models, they too have limitations. Some studies fail to account for the single most important cost for international tourism, namely, the cost of international travel. Studies that account for cost differences driving tourist demand by destination, tend to use Consumer Price Indices, although the 'baskets of goods and services' differ from country to country, are not consumed in similar proportions by locals and tourists alike, and lack measurement uniformity (Divisekera, 2003).

Econometric models have been also widely used, utilizing various techniques such as ordinary least squares, autoregressive distributed lag models, error-correction models, vector autoregressive models, Bayesian VAR, time varying parameter models, and variations (Song and Witt, 2006) and most of them are single equation models. System-of-equations models such as the almost ideal demand system (AIDS), good at forecasting demand for destinations within a region from a source market or a group of source markets, is a much stronger modeling approach. More recent variations of the original AIDS model have not only improved on the variables used but most importantly have taken into account the dynamic nature of the tourism industry by combining several techniques. AIDS models are well fitting in exploring substitution effects and destination competitiveness (Song and Li, 2008). The structural equation model has been used by Turner and Witt (2001) to analyze causal relationships between holidays, business visits and visiting friends and relatives. For instance, time-series models are better for short-term forecasting but rely on historical patterns instead of dynamic structural relationships, while more structural models tend to forecast short-term demand poorly. According to Cortés-Jiménez and Blake (2011), time varying

parameter models and panel data models are better at estimating inbound demand and AIDS models tend to be better in analyzing outbound demand.

Panel data analysis, by incorporating structural econometric models that include both cross-sectional and time-series techniques, has distinct benefits over other models. However, as its forecasting ability has yet to be confirmed, it has not been widely used in tourism demand research. Song and Li (2008) have found a handful of studies that have used panel data analysis between 2000 and 2007. Ledesma-Rodríguez, Navarro-Ibáñez, and Pérez-Rodríguez (2001) modeled demand for Tenerife tourism through both static and dynamic panel data analysis. They found that in the long-term inbound demand is elastic with respect to income and inelastic when it came to prices and travel costs.

In this article we employ recently developed panel data techniques to test the influence of various factors that determine the inbound tourism to the United States. Our panel data set includes 50 countries and 26 years covering the period from 1986 to 2011.

METHODOLOGY

Model Specification

This section discusses the model specification to identify the determinants of tourist arrivals to the United States. The study uses annual data from 1986 to 2011 for tourist arrivals from 50 major countries of origin of tourists. Tourist arrivals from these 50 countries account for more than 95% of total tourist arrivals to the United States. In the usual notation the tourism demand function can be written as follows:

$$TA = f(PCI, PT, RER, TRC, VS) \quad (1)$$

where TA is the number of visitors, RPCI is the real GDP per capita, PT is the tourism price, RER is the real exchange rate, TRC is the travel cost, and VS is a dummy variable representing visa requirements.

The data is compiled within a panel data framework in light of the relatively short time span of the data. Assuming (1) to be linear in logs, the estimated model can be written as:

$$\ln TA_{it} = \mu_i + \delta_i t + \beta_1 \ln RPCI_{it} + \beta_2 \ln PT_{it} + \beta_3 \ln RER_{it} + \beta_4 \ln TRC_{it} + \beta_5 VS_{it} + \epsilon_{it} \quad (2)$$

where TA_{it} is the natural log of number of visitors from country i to the U.S. in period t , $RPCI_{it}$ is the natural log of real GDP per capita of country i in period t , PT_{it} is the natural log of tourism price of country i in period t , RER_{it} is the real exchange rate between the U.S. and country i in period t , TRC_{it} is the travel cost from country i to the U.S. in period t , VS_{it} is a dummy variable representing whether or not country i is required visa to enter the United States, $i = 1, 2, 3, \dots, N$ for each country in the panel and $t = 1, 2, 3, \dots, T$ refers to the time period. Our panel data set includes 50 countries and covers 26 years from 1986 to 2011. According to economic theory, the expected sign of the coefficient β_1 is positive while other four parameters, β_2 , β_3 , β_4 , and β_5 are expected to have negative signs. The parameters μ_i and δ_i allow for country-specific fixed effects and deterministic trends, respectively, while ϵ_{it} denote the estimated residuals which represent deviations from the long-run relationship.

DATA SOURCES AND VARIABLES

The study uses annual data from 1986 to 2011 for tourist arrivals from 50 major countries of origin of tourists. The list of the countries is presented in the Appendix. Annual data on tourist arrivals to the United States were collected from the U.S. Department of Commerce, International Trade Administration, *Office of the Travel and Tourism Industries*. Data on real per capita income (real GDP per capita at 2005 constant dollars) were collected from the United Nations Conference on Trade and Development, *UNCTADSTAT Database* at <http://unctadstat.unctad.org>.

Tourism prices, which represent the cost of goods and services purchased by tourists in the destination, are measured by relative prices. The relative price variable is given by the ratio of the tourism price index of the United States and the consumer price indices (CPI) of the origin countries. The information on the tourism price index of the United States was obtained from the U.S. Department of Labor, *Bureau of Labor Statistics* while the data on consumer price indices (CPI) of the origin countries were obtained from the International Monetary Fund, *World Economic Outlook Database* (September 2011).

Following Lim and Macleer (2001), the real exchange rate, RER_{it} , was constructed as,

$$RER_{it} = \frac{CPI_{US,t}}{CPI_{it}} \times \frac{1}{ER_{it}} \quad (3)$$

where RER_{it} is the real exchange rate between country i and the U.S. in time t , ER_{it} is the bilateral nominal exchange rate (measured as the number of foreign currency units per U.S. dollar) with country i at time t , $CPI_{US,t}$ is the consumer price index (2005=100) of the U.S. and CPI_{it} is the consumer price index of i^{th} country at time t . The data on nominal exchange rates and consumer price indexes were taken from the International Monetary Fund, *International Financial Statistics database*.

The cost of travel variable was calculated combining the distance between a given country and the U.S. and the price of oil. Though some studies have used price of oil as a proxy for cost of travel (for example, see Garin-Munoz and Montero-Martin, 2007), this study estimates the cost of travel by multiplying distance between the two countries by the price of a barrel of oil. The data on oil prices were taken from the International Monetary Fund, *International Financial Statistics database*. The final variable, VS, takes the value of 1 if visa is required for country i to enter the United States or takes the value of zero (0) otherwise.

EMPIRICAL RESULTS

After having established consistent evidence of cointegration, the panel OLS technique for heterogeneous cointegrated panels is used to estimate the model. In order to identify the impact of relatively restrictive tourist visa policy after September 2001, two separate models have also been estimated for pre- and post-2001 periods. The results of this analysis are presented in Table 3. Let us first discuss the results of the full sample covering the period from 1986 to 2011. All the coefficients have the expected signs and are statistically significant either at the 1% or 5% significance level. Given that the variables are expressed in natural logarithms, the coefficients can be interpreted as elasticity estimates. The results indicate that, for the full sample, a 1% increase in foreign income increases tourism arrivals by 1.27%; a 1% increase in tourism price decreases tourism arrivals by 0.01%; a 1% increase in real exchange rate decreases tourism arrivals by 0.01%; and a 1% increase in travel cost decreases tourism arrivals by 0.16%. The results suggest that tourism demand to the United States must be considered a luxury good. When the models are estimated to the 1986-2001 and 2002-2011 periods, two of the variables, i.e., tourism price and real exchange rate, become statistically insignificant though they still maintain the expected signs.

Table 3. Empirical Results: Panel Least Squares Estimates
(Dependent variable: TA ; Excluding VS variable)

Variable	1986-2011	1986-2001	2002-2011
Constant	3.3340*** (9.41)	0.3427 (1.31)	4.4137*** (8.40)
<i>ln</i> RPCI	1.2077*** (9.22)	1.2754*** (7.42)	1.5483*** (7.79)

Number of Observations	1,055	688	367

Notes: The figures in parentheses are the absolute values of t-statistics. *** and * indicate the statistical significance at the 1 percent and 10 percent level, respectively.

SUMMARY AND CONCLUSIONS

The objective of this paper is to analyze the demand for tourist arrivals to the United States, using the panel cointegration technique. The study attempts to identify and measure the impact of the main determinants of the inbound international tourism flows to the United States. The study uses annual data from 1986 to 2011 for tourist arrivals from 50 major countries of origin of tourists. These 50 countries account for more than 95% of the tourist arrivals to the United States. The multivariate framework includes the tourism arrivals, real GDP per capita in constant 2005 U.S. dollars, the tourism price, the real exchange rate, and the cost of travel.

The panel unit root tests indicate all the variables are integrated of order one. The panel cointegrations tests show that all seven test statistics reject the null hypothesis of no cointegration at the 1% significance level, indicating that the five variables are cointegrated. All the coefficients have the expected signs and are statistically significant either at the 1% or 5% significance level. Given that the variables are expressed in natural logarithms, the coefficients can be interpreted as elasticity estimates. The results indicate that, for the full sample, a 1% increase in foreign income increases tourism arrivals by 1.27%; a 1% increase in tourism price decreases tourism arrivals by 0.01%; a 1% increase in real exchange rate decreases tourism arrivals by 0.01%; and a 1% increase in travel cost decreases tourism arrivals by 0.16%. The results suggest that tourism demand to the United States must be considered a luxury good. When the models are estimated to the 1986-2001 and 2002-2011 periods, two of the variables, i.e., tourism price and real exchange rate, become statistically insignificant though they still maintain the expected signs.

The findings of the study could have been different if we had used a longer time period. Future research could concentrate in expanding the time period as well as the coverage of countries or focusing on few selected countries which has relevant data for a longer time period. This would help us uncover the variables that determine the tourist arrivals to the United States.

Appendix Table 1: List of Countries

Argentina	Costa Rica	Hong Kong	Nigeria	South Korea
Australia	Denmark	India	Norway	South Africa
Austria	Dominican Republic	Ireland	Panama	Spain
Bahamas	Ecuador	Israel	Peru	Sweden
Belgium	El Salvador	Italy	Philippines	Switzerland
Brazil	Finland	Jamaica	Poland	Taiwan
Canada	France	Japan	Portugal	Trinidad & Tobago
Chile	Germany	Mexico	Russia	Turkey
China, PRC	Guatemala	Netherlands	Saudi Arabia	United Kingdom
Colombia	Honduras	New Zealand	Singapore	Venezuela

OUTRUNNING THE ORGANIZATIONAL CULTURE CONSEQUENCES IN THE POST-MERGER INTEGRATION PROCESS AT EUROPEAN LEVEL

Mariana Crintea, Free International University of Moldova, Chisinau

Natalia Burlacu, Free International University of Moldova, Chisinau

Marieta Micu, Free International University of Moldova, Chisinau

ABSTRACT

In the post-merger integration, organizational culture plays a key role in the successful merger between Absorbance Company and the absorbed company and in that it is both effect and cause the establishment and strategic and financial objectives. An effective post-merger organization can be a source of competitive advantage; therefore, to implement specific strategies needed to conduct post-merger actions, thus it is important to assess the consequences in terms of characteristics of organizational culture at likely occurrence multicultural terms.

In light of these considerations, continuous improvement of management strategies should allow existing management tools to adapt to the new demands of the organizational culture of companies absorbent / absorbed, requirements imposed by changes in the stages of post-merger, that are to be carefully monitored and that the growing demands, are in a changing European companies.

In conclusion, simultaneously and interdependently to create the paradigm and value system, organizational culture, which supports a high degree of performance must be consistent and aligned with the new organization's overall strategy and to ensure external balance adjustment according to company requirements absorbed and cultural integration of the company's internal system absorbed under promote a successful partnership, under which umbrella to meet financial quotas to support the post-merger sustainability.

JEL CODES: G34, L24, L25.

KEYWORDS: post-merger integration, organizational culture, competitive advantage, European companies, benchmarking.

INTRODUCTION

Mergers among European companies tend to become a sine qua non of social and economic progress, globalization and the globalization of world economy development putting their mark on the increase concerns the internationalization of management systems.

Based on this accepted, it sees the need for optimal integration and consistency of endogenous and exogenous variables in the management subsystems of the new company created from the merger.

Moreover, the global market will gradually turn into a means of ensuring the integration and trade intense flows, fact that allows metamorphosis post-merger companies in accordance with the specificities of each country.

Thus, evolutions of unexpected mergers allow relocation and relocation of multinational companies working points, depending on business requirements and capacity. Thus, it is necessary to consider besides the cultural circumstances of the companies involved in merger and cultural context of the geographical area that will enable the new company, result of merger.

Therefore, that economic success, made post-merger, will be coupled with the cultural characteristics of communities in the vast strategic business alliances and the degree of specialization and diversification of

management tools in the context of monitoring concrete and coherent integration of managerial post-merger, both in terms of management objectives and in terms of financial targets.

SETTING AND MONITORING MANAGEMENT PROGRAM REQUIREMENTS IN POST-FUSION EUROPEAN STRATEGIES

At European level, analysis and monitoring requirements to establish management strategies in post-merger programming allows us to analyze the quantitative importance of fundamental strategic pillars. Notice so that the three key strategic pillars are represented in decision fusion: increased market share, cost synergies, access to new geographical markets, given their percentage mark quite high: 58%, 37% and 33% of total respondents.

Table 1. Synopsis of the main objectives of the post-merger companies and their frequency of monitoring

Nr. C R T.	STRATEGIC OBJECTIVES OF MERGERS AND TAKEOVERS		Monitoring the post-merger management integration -per strategic objectives -		FINANCIAL OBJECTIVES OF MERGERS AND TAKEOVERS		Monitoring the post-merger management integration -per financial objectives-	
1.	Market share growth	58%	Weekly	9%	Revenue growth targets	42%	Weekly	9%
2.	Cost synergies design	37%	Monthly	40%	Global synergy goals	35%	Monthly	57%
3.	Access to new geographical markets	33%	Semestrially	34%	Earnings before interest and taxes	31%	Semestrially	25%
4.	Access to new products	23%	Annually	5%	Return on invested capital	20%	Annually	4%
5.	Reducing the number of competitors	19%	Just once at the end of the merger	6%	Return on own capital	19%	Just once at the end of the merger	2%
			Irregular	7%			Irregular	3%

Source: Official data by PricewaterhouseCoopers LLP in: Post Merger Integration, Survey 2009, European results, Delivering Deal Value

However, the three pillars of financial origin are represented by revenue growth objectives, global synergy goals and aim revenue before interest and taxes, given and marking them in such high percentages: 42%, 35%, respectively 31% of total respondents. Also, access to new products and reduce the number of competitors are also considered along with the three mentioned above, the decision variables compelling strategic management of two companies to merge. Mark reflects their importance to the previous lower (but still impressive synoptic following its introduction in the front), with peak rates of 23% respectively 19%.

Continuing the same line financial goals include merger and absorption of the above and to the profitability and return on equity capital marking 20% and 19% of all respondents. Moreover, in addition to ranking high interest objectives, strategic and managerial level, summarizing information from the aforementioned study, gives us an opportunity to examine the frequency of monitoring the effects of the merger. Therefore, we see a strong interest in reporting monthly and 40% by 57% per strategic objectives and financial targets, strategic quarterly reporting practice followed by 34% and 25% financial, but preferably the difference is significant, monthly reporting is the most representative. In contrast, the annual reports, once at the end of merger and irregular are reporting practices, dealing with insignificant parts of strategic objectives, namely: 5%, 6% or 7% and 4% per financial goals, 2% and 3%.

ORGANIZATIONAL CULTURE IMPACT WITHIN POST-FUSION MANAGEMENT STRATEGIES DESIGNING

Analysis of organizational culture at multicultural, add other primary activities of the future market prospect of implantation, as managerial strategy, given the assurance, at a defined space and time within a budget determined by a combination of optimal post-merger, to provide economic and financial benefits under which it started absorbing alloy with the absorbed companies. Therefore, continuous improvement of management strategies should allow adaptation endogenous and exogenous variables of the new company formed from the new EU requirements, requirements imposed by changes in technologies, markets and supply, ie the increasing requirements that are in a changing European consumers.

Therefore, the increasing complexity of modern society need a diagnosis to be printed, real and concise, to be able to sustain overall management of material resources, financial, human and information that will be the starting point in achieving the targets post-merger. However, organizational diagnosis, diagnosis requires a culture of its organization, establishing himself as cultural diagnostic companies, by the fact that it may impose evolutionary trend of managerial processes in the context of optimal performance of post-merger integration.

Note that there is a certain culture within the company may hamper or foster the development of companies in the context of optimal performance of post-merger integration. A strong culture, suitable environment and appropriate strategic objectives contribute to the company's development. Values as innovation, creativity, initiative, risk taking can further the objectives. Or, rather, an objective that penetrates existing markets with new products may be hampered by cultural differences between partner companies or by lack of responsibility of employees of one of the companies.

Cultural norms influence, for example, negotiations between buyers and sellers. Moreover, products must be adapted to the crop, as the name brand, as well as packaging and composition. Also, culture is one that affects the price of goods and therefore the distribution channels. Certain cultural norms prohibit price and can change the entire distribution system by redirecting channels used, in order to reconfigure the profitability curve.

All these are considered key elements that can determine the success or failure of post-merger. Thus, some organizations, according to their culture and philosophy, with increasing quality, and price increases. In contrast to other companies whose culture is not customer oriented, but at a substantial profit in the short term, in any conditions, rising prices is an increase of quality, but other considerations. This distribution channels, may be transformed in accordance with every feature of the country of origin management, or the market in the country of implantation. But, sensitive to changes in the structure should be closely monitored internal and external reaction to the new changes.

The cultural adaptation of the companies on successful post-merger objectives, strategic management should have regard to the behavior foreshadowing long-term competitive organization, taking into account both organizational culture and contextual developments. This organization reflects the culture; beliefs are components of an organization on their group's evolving ability to compete in a market, to act on that system of perception.

Organizational culture is expressed through attitudes, behaviors, belief systems, attachments, aspirations and values performers and managers, manifested in work processes. A powerful strategy project a certain behavior, organizational culture reflecting improvement in approach. The starting point for post-merger strategy should form an accurate definition of its mission, focused on the detailed explanation of the relationship between management, employees and context. This is one of the differentiations of management systems of companies in various "zones" of the world and is rooted in cultural differences between countries, attitudes towards management, to creating and maintaining an organizational climate and motivation necessary to achieve objectives.

Addressed as the product of collaboration of internal and external stakeholders, the mission of an organization, in the context of optimal performance of post-merger integration, must aim at consensus regarding the objectives set in the context of policy design and promote appropriate use of resources.

Thus, the role of formulating post-merger organization mission is to achieve consensus on the goals pursued within the organization, providing a basis for motivating the use of resources in a certain way, developing a concept for resource allocation organizations, establishing a climate, the harmony overall organization, serving as a focal point for those who can identify with the goals and directions of action of the organization and to prevent them from doing so those who are unable, to facilitate objectives reflect the organizational mechanism of the organization, formulating general goals organization and their translation to facilitate the objectives related to cost, time and results that can be assessed and controlled.

The fundamental objectives of the strategy post-merger company absorbing the starting point in shaping a system that covers all categories of targets procedural and structural components of the company.

Thus, like redesigning objectives in the context of optimal performance of post-merger integration, fundamental objectives drawn from companies absorbent / absorbed, must redesign major components of global policies or partial new organization to promote sustainable development.

CONCLUSIONS

To achieve this competitive advantage, management organization shall, through post-merger strategy, to opt for the incorporation of endogenous and exogenous variables of the culture of both companies involved in mergers, which are rated as very important partners. These attributes can refer to reengineering management subsystems, the use of management tools, or the manner of managing global resources company.

Integration components mentioned above configuration allows specifying the overall post-merger strategy, on the organization as a whole, in the context of optimal performance of post-merger integration. It is important that post-merger organizations to develop, beginning an operational strategic outrunning of the cultural inconsistencies that can lead to erosion of the partnership, to ensure realistic recovery opportunities for their development, the longer time intervals (three to five years), in a complex competitive environment, domestic and international, becoming stronger.

Thus, strategies brought forward the cultural mismatch must be able to ensure articulation of procedural components of the organization in an "all" coherent and print it features complex, open, adaptive organic.

But features integration post-merger management companies makes the absorbent / absorbed companies members to deal with complex problems, which in many cases are unpredictable and random and sometimes requiring complex solutions to solve.

Consider, in this respect, promoting monitoring shorter period onset of fusion, then report monthly to become a precondition for optimum performance. Also note that post-merger monitoring report only once at the end termination of the operation, opens the way for further cultural mismatch that may occur as the un-fast circumstances, the impact on the continued effective and efficient commercial activities new companies, result of merger.

Thus, accessing variables characteristic external benchmarking can benefit more, companies in process post-merger managerial integration, known as the famous saying "you learn from your mistakes", adding that the achievements and experience in advance the cultural mismatch can bring more value, the board of management will find the way to redesign the management tools for coordination purposes optimal strategic global resources of both absorbing and absorbed companies.

DETERMINANTS OF UNITED STATES OUTBOUND FOREIGN DIRECT INVESTMENT IN LATIN AMERICA AND CARIBBEAN: A PANEL DATA ANALYSIS

E. M. Ekanayake, Bethune-Cookman University
John R. Ledgerwood, Embry-Riddle Aeronautical University
Mihalis Halkides, Bethune-Cookman University

Abstract

The objective of this paper is to identify the determinants of United States outbound foreign direct investment (FDI) in Latin America and the Caribbean, using the panel cointegration technique. The study uses annual data from 1982 to 2010 and covers sixteen countries in the Latin America and Caribbean region. The relationship between FDI flows and various economic variables was estimated by using pooled cross-country and time-series data to control for country-specific and time-specific effects. The study identifies and measures the main determinants of United States' outward FDI across a range of variables including bilateral and multilateral trade, market size, GDP growth, openness, and resource endowment. The panel unit root tests indicate all the variables are integrated of order one. The panel cointegrations tests show that all seven test statistics reject the null hypothesis of no cointegration at the 1% significance level, indicating that the variables are cointegrated.

DIMENSIONING EUROPEAN COMPANIES POST-MERGER INVOLVEMENT WITHIN SOCIAL RESPONSIBILITY PROJECTS - HELPING CHILDREN WITH SPECIAL EDUCATIONAL NEEDS CASE STUDY

Marieta Micu, Free International University of Moldova, Chisinau
Svetlana Rusnac, Free International University of Moldova, Chisinau
Mariana Crintea, Free International University of Moldova, Chisinau

ABSTRACT

Known as the worldwide features students with learning difficulties, companies with high involvement in social responsibility activities contributes to the development of international projects to support their normal development, given that post-merger financial possibilities are higher and part of the net profit can be easily redirected to support initiatives of social involvement. Moreover, the performance of any socio-economic activities is inconceivable without the presence and human intervention, not only embodies consumer needs, but also possession of skills that allow him to act to meet those needs. This paper focuses on the involvement of companies, post-merger, to support projects that involve children with special educational needs motivating economic and financial capacity increased due to their merger, thereby promoting access to long-term benefits of optimal development of this social category.

INTRODUCTION

Assuming that the main wealth of society is the human resource as the only factor able to exploit all other resources of the macro creator and society itself, the main factor of production in all societies and at the same time, the key issue the economic restructuring, which began this study by stating the urgent need for companies in social projects designed to promote optimal development of children, the future intellectual capital management systems.

Known as the worldwide features students with learning difficulties, companies with high involvement in social responsibility activities contributes to the development of international projects to support their normal development, given that post-merger financial possibilities are higher and part of the net profit can be easily redirected to support initiatives of social involvement.

Moreover, the initial actions of social responsibility projects have brought to the forefront the realization that many students have school failure due to limitations in processing certain types of information, which determines various difficulties: lack of organization, socializing difficult, prone to accidents, difficult to adapt to changes, hyperactivity or lethargy, lack of attention. But most relevant is that, following internal investigations conducted by HR in consultation with department heads is observed that these symptoms are manifested among employees or among employees whose children are integrated in this category. Motivation focusing on the need for involvement of companies, post-merger, in support of projects concerning children with special educational needs lies in economic and financial capacity increased, following the merger, their access to support long-term benefits of optimal development of children in this category .

MERGERS ECONOMIC FOOTPRINT UPON WORLDWIDE SCENE

Macroeconomic context of labor market, employment structure shows that the population underwent considerable changes from the previous period. Transition to market economy has greatly influenced the employment of the population in terms of volume, structure, and resulted in labor market adjustment policies, while redesigning the companies involved in merger and absorption processes, the border often.

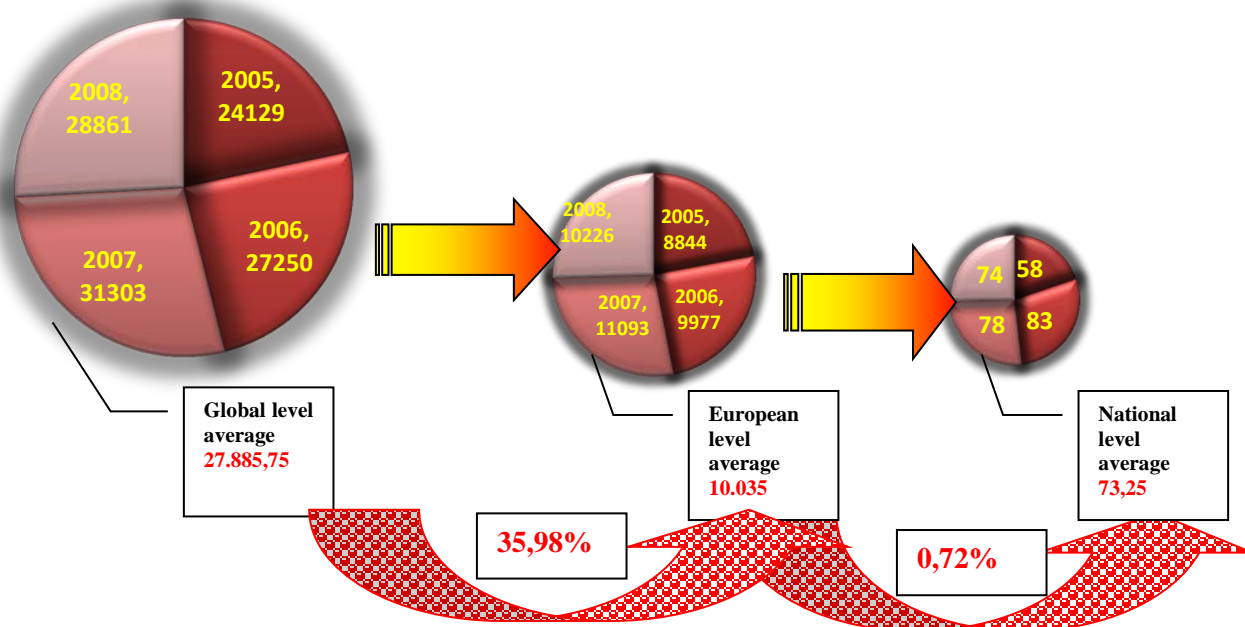

Figure 1. Quantification share mergers and acquisitions in the period 2005-2008, the European level of total world and local level in all European - made by the author upon later graphics processing statistical data provided by Thomson ONE

Thus, the synthesis and processing of statistical information accessed through ThomsonONE, we present an average of approximately 27,886 worldwide mergers and takeovers, of which the European share is 35.98% with an average of 10,035 mergers in recent years. At the local level trend of mergers its place if we consider an average of 73.25%. We therefore consider the need to accelerate technical progress, according to a market economy based on a fierce competition management directs an organization to develop new work programs to majoreje productivity and reduce human capital costs. There is much in the European total 10,035, but the average percentage of 0.72% is Romanian companies' efforts to reach an EU benchmarking successes through organizational alloying, to activate effective in certain sectors or geographical areas.

Therefore, considering the global average, 27,886, European level, 10,035, and not from the local level of 73, subliem again that economic practice highlight the analysis: management elements of management in an efficient manner is, the sine qua non, the first step in registering companies (absorbent and absorbed) on the road to economic success. Therefore, among other interests, mainly related to social image specialist market, companies supporting the project starts this category of children under tocami inefficiency to prevent future human capital. Typically, companies with extensive experience in cross-border merger and absorption are involved in social responsibility projects, given the regular diagnostics which reveal deficiencies at a cost implication, human capital in specific business activities.

PROMOTING THE DEVELOPMENT OF CHILDREN WITH SPECIAL EDUCATIONAL NEEDS SUPPORT BY COMPANIES

Of economic practice specialise incursion, we can mention that is observed in a high share, mainly involvement of pharmaceutical companies operating in the market, in private social responsibility. The most prominent example is the company GSK, a result of successful fusion and world renowned in the UK between Glaxo Wellcome and SmithKline. Post-merger financial goals are achieved, GSK Always record economic growth results. Moreover, the two in 2011-Q2 semestrului the întregirează powerful performance with underlying sales growth, overall group turnover was 6.72 billion pounds for euros.

Therefore, this group of economic performance, social responsibility programs are designed to focus on long term health problems and patient access to and investment in education rises in the world to brand reputation. Furthermore, with strong financial support these companies design new programs that employees have the opportunity to apply their knowledge in a completely new area with charities worldwide. Thus, post-merger social responsibility is clearly significant for social communities, if we consider partnerships with civil society as an employee of these companies work full-time with NGO partners to provide extraordinary support categories children with special educational needs worldwide. These, although aptitude for certain areas, and often have uneven performance can not be employed in regular classes.

The term learning difficulties covers a very heterogeneous group of students. Recent studies show that they can be divided into three categories, depending on the difficulty of visual-spatial perception, language and attention.

Business involvement in supporting their education, is a focal point in supporting social responsibility, especially when you consider resizing accessing human performance at work. Furthermore, the literature shows that better use of labor resources finds its source in combining intensive and extensive development factors in educational construction sequence, under the gradual deepening social and economic development, under increasing labor productivity and net profit.

Moreover, respecting European coordinates can systematically develop comprehensive policy strategies in the national reform programs to improve the adaptability of children with special educational needs in social and economic environment, to ensure a high level of employment security, respectively, can to easily find a job at any stage of active life and have a good prospect for career development in a changing economic environment.

Moreover, insurance and European funds are waiting to be accessed through social development projects. Thus, the increasing tendency of school integration in regular education facilities for children with educational needs speciale is well known both in the world and in Romania and complexity caused by the reality of normal events and integration lead to interpretations, delays, experiments, sounding, successful and failures to act of integrating children with special educational needs in schools. The category of children with SEN are both disabled children themselves - in which special needs are multiple, including educational, and children without disabilities, but who are stable inadapatare events at school requirements. So, in this category are:

- Children with sensory impairments: visual, auditory, motor etc.
- Children with mental disabilities,
- Children with emotional disorders (emotional),
- Children with associated disabilities.

We believe both companies resulting appropriate involvement of mergers, but as they have most often significant financial and economic results. And, focusing on supporting the promotion of integrated education refers essentially to integrate children with special educational needs in structures that can provide a climate conducive to the harmonious development of these children and a balancing of their personality.

Also, easy access to European funds for social development, the companies mentioned above, contributes to the flexibility of the design of recovery strategies, correction and development of cognitive skills and partial deficit, remedial action must always respect the personality and level of impairment of the child. Selection criteria for program development, stages a spring program will be the competent person: psychologist, pedagogue, teacher advisor, and here being able companies and contributes financial support to these actions by or through the provision of specialized personnel.

Thus, primarily, to promote human capital strategies will focus on the size of human capital resources according to strategic and operational needs of the national economy and ensuring efficient use of these resources. The development of strategies to underpin economic development strategy by setting future human capital requirements by identifying ways to use top of the capital, where human capital available to support the implementation of economic development plans.

Today, students with special needs, is a focal point of social concerns. Admission diversity of class and especially the idea that each has its own intellectual abilities, their needs in the assimilation of information, is the first step to support and children with special needs in education. Given the active involvement of family and parents participating with physical or mental, of children in classes or other organized activity, its involvement is direct as possible, the emotional state of parents having a major impact on the conduct of the commercial.

From this point of view, awareness of the need to support this category is very current global and local level.

CONCLUSIONS

At the microeconomic level, the objectives to be achieved, post-merger organizations are increasingly required to cope with challenges such as to require the ability to secure and maintain competitive success by anticipating developments contextual. Therefore, a problem whose solution largely conditions the development and rational use of human resources in organizations is the introduction of human resource policies and strategies geared systematically towards long term goals. Moreover, the performance of any socio-economic activities is inconceivable without the presence and human intervention, not only embodies consumer needs, but also possession of skills that allow him to act to meet those needs.

Continuing on the same line, there is increasingly involve companies in providing necessary support design of future human capital, appropriate cost-effective business transactions. Despite the economic crisis some companies, as a result of successful merger, and have sized financial support to constantize how their contributions are important for beneficiaries and for these donations are vital for the initiatives it supports, in some cases for many years. These companies are the result of some successful megafuziuni, are constant partners of local communities to develop programs that are innovative, sustainable and beneficial. They often focus their investments in social and health projects, carried out with strong civil society partners.

Also, dimensioning problem of child with special educational needs at the forefront of bringing our analysis and the need to involve these companies in various administrative projects and fundraising for centers dealing with this social category. Moreover, the world is encouraging long-term involvement, various sizes of companies and cultures in voluntary programs designed to provide considerable support

for disadvantaged. Thus, it is recommended, under the sustainable development of social communities, promoting business involvement in projects that will provide support with social and economic inclusion of children with special educational needs.

WORKING PAPER BEHOLDING HR STRATEGIES ALIGNMENT WITH THE CORPORATE STRATEGY

Elvira Nica, the Academy of Economic Studies, Bucharest

ABSTRACT

Beholding HR strategies alignment with the corporate strategy, we took into consideration the economic environment of corporate strategies and aligning HR strategies with the main corporate guidelines, from the performance improvement point of view. Within this article we have outlined the high importance of aligning the HR strategies to the general corporate strategies.

Moreover, we have emphasized the fundamental guidelines in designing and implementing work policies and strategies, as considering occupational risk assessment being carried out through finding and putting into a hierarchy, according to indices of severity and probability, of exogenous variables, referred to as the performance metrics, to which human factors are evaluated upon, factors relevant to an enterprise, in the purpose of creating effective measures to prevent inter-organizational malfunctioning due to lack of coordination between departments and resources..

JEL CODES: J22, J24, J28.

KEYWORDS: HR strategies, alignment, corporate strategies, effective measures, performance metrics.

INTRODUCTION

Referring ourselves to the innovative HR strategies it is a must to re-underline the fact that with the introduction of new technologies, we witness a reduction in the cost of accessing, storing and transmitting information. Digital information is so accessible and having low costs, that human factor can turn into new economic and social values, revealing new opportunities for designing new services and products. Human capital, administrating such information, developed becoming a strategic resource for the digital economy, in terms of adaptation human resources strategies to corporate general strategies.

Romania's accession to European Union managed to create confusion around the people, concerning the learning system and the labor market. All the rules were taken as a must do rather than a must understand. As an example to sustain this saying we have the must change the university studies structure and the must work at a European level. And the most important issue is that these two variables were taken separately.

What should we always take into consideration is the fact that to gain productivity of labor one must put into the efficiency equation the variables: studies level and labor field. The result of this equation cannot be other than economic growth, in terms of adaptation human resources strategies to corporate general strategies.

We propose thus placing a greater emphasis on supporting the development of initial and continuing education, increase mobility, flexibility, adaptability of work and efficient use of the unemployment insurance budget in the implementation of active measures, in terms of adaptation human resources strategies to corporate general strategies.

THE ECONOMIC ENVIRONMENT OF CORPORATE STRATEGIES

The economic reality is characterized by permanent changes in all fields of activity, especially in the social and economic domain, which has known alert rhythms of change. We are thus witnesses to the transition to a knowledge-based economy, and here are some relevant factors to be taken into consideration: the accession to the European Union, the increase of the minimal national wage, the introduction of calculation indexes of the minimal national wage according to the level of professional training, the obligation of appointing a person for a certain job according to the education requirements of the respective position (higher education, high school education, unskilled workmen), to the apparition of social groups which promote the new processes and modify the changing tendencies.

However the experience of economically developed countries, signals the need to increase investment in technical means and in particular into human capital in terms of using new technologies, in order to obtain competitive advantages onto the digital market, in terms of adaptation human resources strategies to corporate general strategies.

Certainly, the experience of developed countries shows that lack of involvement in this process of transition to the digital economy can generate serious consequences on both the survival and development of enterprises, for region or also for a state.

In this respect it must be primarily designed a paradigm of instruction of beneficial effects of the compliance with ergonomic principles at work and the methods and techniques for optimizing the human-technology interaction, that should adapt to the scientific standards established to focus on development in the field, in order to integrate theory, experience, design and practice, in terms of adaptation human resources strategies to corporate general strategies.

Educating the human operators of automated systems and improving their abilities in the purpose of preparing to conduct, in optimal conditions, their role in the work environment has an immediately beneficial effect to reduce or even eliminate the risks of human error.

For this purpose, the objectives of increasing labor productivity must increase reliability concerns for sizing systems ergonomic human-technology interaction, which is in the current context, one of the most important factors for raising economic efficiency and the largest pool of production that exists in latent phase, in terms of adaptation human resources strategies to corporate general strategies.

ALIGNING HR STRATEGIES WITH THE MAIN CORPORATE GUIDELINES

The materialization of the above mentioned objectives in business and organization management at the level of human operators is facilitated by the created company, in which the role of human factor increases, as people, in their double as producers and owners of the means of production, have a new attitude towards work, from which they become active participants in the process of production and continuous improvement of forms and methods of its organization, as well as in the design, implementation, evaluation and optimization of semi-computerized and fully-computerized working systems, in terms of adaptation human resources strategies to corporate general strategies.

Nowadays we may observe that the professional ethic is more and more influenced by the characteristics of the new economy – the knowledge based economy. We hereby propose to tackle the importance of the trained professionals in the financial-accounting, considering the process of alignment these field regulations to knowledge based economy requirements. So, we wonder what means being ethic.

Can we find any connection between accounting ethics and the knowledge based economy? Can this economy determine new fundamentals and principles? What are the consequences on accounting professionals?

Figure 1. Beholding HR strategies alignment with the corporate strategy

A fundamental step in designing and implementation of health and safety at work policies and strategies, occupational risk assessment is carried out through finding and putting into a hierarchy, according to indices of severity and probability, of exogenous variables, referred to as the risks, to which human factors are exposed to factors into an enterprise, in the purpose of creating effective measures to prevent occupational accidents.

Thus, in this framework it is found as absolutely necessary to revive the motivational process. The doctrine underlines the differences between financial and non-financial motivational methods, but it should also firmly underline the need for their strong binding, even though the financial rewards are more powerful in today's capitalized economy.

The crisis is a wake-up call; the moment when we recognize that "business as usual" would consign us to a gradual decline, to the second rank of the new global order, in terms of adaptation human resources strategies to corporate general strategies.

This is Europe's moment of truth. It is the time to be bold and ambitious. To achieve a sustainable future, we must already look beyond the short term. Europe needs to get back on track.

Then we must stay on track. That is the purpose of future Europe 2020. It's about more jobs and better lives. It shows how Europe has the capability to deliver smart, sustainable and inclusive growth, to find the path to create new jobs and to offer a sense of direction to our societies.

The transfer of brain-drain to brain-gain can be achieved only in the context of free access to information policies development, in real time, this concept will basically become the central pillar of training policies in the Member States, so young people and adult population hold the key to use economic principles in order to ensure the economic and also social progress, in terms of adaptation human resources strategies to corporate general strategies.

The interdependence between economic growth and human capital quality, determined the implementation of policies that support the return of "brains" in the country of origin, while ensuring the favorable conditions for their development in the workplace, in the purpose of promoting the maintenance and improvement of life quality for them.

Endogenous parameters that generate highly qualified human capital migration towards other Member States is being materialized in the need of human factors to size their environmental quality of living, social factors, economic and political ones having a major impact on the decision to leave the country of origin, in terms of adaptation human resources strategies to corporate general strategies.

In parallel exogenous parameters, materialized into the idea of a better life in another state, is being solidified by the advertising of economic Heaven from outside limits of the country, working together to promote the intention of migration.

CONCLUSIONS

The striking manifestation of the knowledge revolution and many mutations produced in the world economy have led policymakers, especially within the most developed countries, to address these realities in a forward looking and pragmatic vision ensuring the transition to the new economy.

Therefore it was found mandatory to bring into the fore front the need of investments into human resources enlargement, in terms of adaptation human resources strategies to corporate general strategies.

Taking into consideration the labor productivity and life quality empowerment is necessary to align, globally speaking, the strategies of investing into human capital education and health. Promoting the new economy based on spin-offs design, the financial aid must support the intellectual capital progress.

We propose thus placing a greater emphasis on supporting the development of initial and continuing education, increase mobility, flexibility, adaptability of work and efficient use of the unemployment insurance budget in the implementation of active measures, in terms of adaptation human resources strategies to corporate general strategies.

In conclusion, we also reiterate its vitality as a sine qua non condition of inter-regional sustainable development, onto the promotion of the principles of market economy mechanisms in all areas of the country, to improve competitiveness and achieve permanent economic growth, promoting development harmonious of land and network of settlements, increasing the capacity of regions (in terms of institutional, financial, decision making) to support their own development process, creating equal opportunities in access to information, research and technological development, and continuous education and training. in terms of adaptation human resources strategies to corporate general strategies.

ONE ACCOUNT, TWO AUDITS: A TEACHING CASE OF THE AUDIT OF REVENUE AND ACCOUNTS RECEIVABLE

Genese Rogers, Morgan State University

Nathan Austin, Morgan State University

ABSTRACT

The purpose of this case is to allow students to link the theory of audit risk, auditor objectives, and audit evidence surrounding the audit of revenue and accounts receivable in a practical situation. This case involves two audit teams of the same Big 4 firm who are seeking to sufficiently audit revenue and accounts receivable transactions. It is intended for upper class undergraduate students (juniors/seniors) who have completed two Principles of Accounting courses and possibly one Intermediate accounting course. These accounting courses would have provided the students with the knowledge of revenue recognition and understanding of the revenue and receivables process. This case allows students to demonstrate their understanding of the principles of revenue recognition and the audit process of revenue and receivables. Students will have the opportunity to identify audit risks and devise a plan for testing revenue and accounts receivables transactions. The objectives of this case are to apply the revenue recognition principle, identify issues with revenue recognition, recognize situations that impact the audit of revenue and receivables, understand management's financial statement assertions, understand and apply the auditor's objectives over revenue and receivables, and understand and apply test of controls and substantive testing over revenue and accounts receivable.

INTRODUCTION

Burned out after completing the annual audit with one of the Big 4 audit firms, Larry Thompson, the Controller of A Plus Physician Services (A Plus), was perplexed with a phone call. It was the auditor of Helping Hand Physicians (Helping Hand), one of A Plus's affiliates. In response to the auditor's request for some information, Larry asks "What do you mean you are conducting a separate audit of Helping Hand's accounts receivable balance?" He went on to remind the auditor saying, "We just finished an audit with a different audit team of your firm and this audit included the audit of Helping Hand's accounts receivable balance." Still unclear, Larry slams down the phone. Seeking further clarification, he immediately calls James Marshal, the Partner of the audit team that performed A Plus's annual audit where the following exchanges took place:

James: "James Marshal."

Larry: "Hi James, Larry Thompson."

James: "Hi Larry, how are things going?"

Larry: "Well not so good James. I received a call from another audit team of your firm conducting an audit of Helping Hand. Helping Hand is an affiliate of our organization. They are requesting to complete a separate audit related to the revenue and receivable balances of Helping Hand."

James: "Oh yes. I am certainly aware of this situation. I had a brief conversation with the audit Partner of Helping Hand's audit team."

- Larry: “Great, so that means you have everything under control and there is no need for this nonsense of an additional audit, right? You explained to him that those receivables are our receivables and they have already been tested thoroughly by your audit team?”
- James: “Well I don’t think it is quite that simple. The Partner of the audit team for Helping Hand believes that those receivables belong to Helping Hand, not your organization.”
- Larry: “Those receivables belong to my organization. This is clearly stated in the agreement. The revenue and receivables on our books include the activity for my organization and Helping Hand. When your team came to our organization to complete your fieldwork, all of our revenue and receivable balances were tested, including those of Helping Hand. Now the audit team of Helping Hand would like to test the revenue and accounts receivable of Helping Hand only. Why would they want to duplicate work?”
- James: Well Larry, we definitely do not want our firm to perform duplicate testing if it is not necessary. I am sure that my team performed a thorough analysis of your revenue and receivable balances while they were out there.
- Larry: “I know they did! I had to get the Director of the Business Office to create special reports just for your staff. These reports gave them all of the sales transactions a couple of days before year-end and after year-end. We provided documentation related to specific transactions that they requested. We also provided them with an aged listing of our accounts receivable subsidiary ledger, accounts receivables reconciliations, a narrative of our revenue and receivables process, and documentation for various sample selections. To go through this process again for balances only related to Helping Hand is absolutely unacceptable!”
- James: “I do understand that audits can be time consuming, Larry. Let me ask you, is Helping Hand a subsidiary of your organization?”
- Larry: No they are not. They are an affiliate of our organization. They operate at a separate location. Their physicians and staff members are not a part of our payroll. They have their own facilities and operational expenses. We have an agreement with them that states that we will make payments to them for the use of their physicians. Their revenue and receivables process follows the revenue and receivables process here at my organization. At the end of the month, we run a report to see how much cash we have collected based on the services provided by the Helping Hand physicians. We then issue a check to Helping Hand for 85% of actual cash received (including checks and credit card payments).
- James: Right, this rings a bell. I recall the audit partner stating that Helping Hand is currently recording their revenue based on these cash payments that they receive from you. They are not able to provide any reports from their system to support this revenue. They are also unable to answer a lot of the audit team questions. Apparently there has been a lot of turnover in the Finance department of Helping Hand.
- Larry: Well they have access to run these reports. We also provide them with monthly reports that include our calculation of how we determined the dollar amount that they are receiving from our organization.

James: Well let me touch base with Helping Hand's audit team to see what is going on. I'll get back in touch with you as soon as everything is finalized.

Larry: Thanks James.

Background: A Plus Physicians A Plus Physicians was incorporated in February of 2000 as a not-for-profit 501(c) (3) organization and began business on July 1, 2000. It is a multi specialty physician practice with approximately 500 physicians and 650 support staff individuals. There are 42 subspecialties of medicine within the organization. The Accounting department has 16 individuals and is headed by the Controller, Larry Thompson. Larry holds a Masters degree in Business Administration and a Masters of Accountancy. Before his employment at A Plus Physicians, he was employed at a small public insurance company for six years. He moved up the ranks from Director of Finance, to Controller, to Vice President of Finance and Treasury, and finally the Chief Financial Officer. After leaving the public insurance company, Larry secured a position with the A Plus Physicians as Controller. He has been employed with A Plus Physicians for the last six years. His responsibilities consist of producing monthly financials, assuring cash collection on non-patient related receivables, budgeting, maintaining banking relationships, managing staff in the area of accounting, finance, treasury, and purchasing, assisting with the offshore subsidiary financial information, and consolidating the financial statements.

The Contract

In June of 2008 Helping Hand Physicians entered into an agreement with A Plus Physicians. Based on the agreement, A Plus is to pay Helping Hand for the services provided by the Physicians of Helping Hand. The payment is based on cash collections received by A Plus for services which are directly related to the services provided by Helping Hand. Helping Hand receives 85% of the cash collected by A Plus. Their revenue, accounts receivable, and bad debt is now a part of A Plus's revenue, receivables and bad debt. The patients treated by Helping Hand are A Plus's patients. In the event the agreement is cancelled, Helping Hand's accounts receivable balances will remain on A Plus's books until the cash is collected. A Plus will continue to pay Helping Hand 85% of cash collections.

A Plus Physicians Revenue Cycle

The main line of business at A Plus Physicians is to provide services to patients. A patient will come to one of the multiple sites to see Physicians for various medical reasons. If required, the front desk attendant collects a co-pay or deductible according to the patient's insurance terms. Once the patient is seen by the Physician, the charges or revenue is entered into the sales journal and account receivable subsidiary ledger. The charge is reviewed for errors and forwarded to the insurance company for payment. Once approved by the insurance company, a check or electronic funds transfer is received by A Plus Physicians. The payment is posted into accounts receivable subsidiary ledger. Any balance not paid by the insurance company is billed to the patient. At the end of the month the subsidiary ledger activity is entered and posted to the general ledger. A monthly reconciliation is completed to reconcile the subsidiary ledger to the general ledger.

Discussion Questions: Assuming that you have been appointed a member of Helping Hand's separate audit team:

- 1) Identify key issues in your client's revenue and receivables process which may have impacts on audit risk.
- 2) Given the above issues you have identified, which management financial statement assertions are you concerned about?

Given the facts in the case, identify items that your audit team would like to discuss and or review with your client in order to achieve your audit objectives over the audit of revenue and receivables.

WORKING PAPER REGARDING HR STRATEGIES GOING ABOVE AND BEYOND MANAGING CUSTOMIZED HR SOLUTIONS

Elvira Nica, the Academy of Economic Studies, Bucharest
Alexandra Mironescu, Romanian-American University, Bucharest

ABSTRACT

During the current economic crashing environment, HR strategies have managed to offer the needed breath of innovative guidelines. Companies that have put it all on the human capital are now, mostly, found between the profitable, low affected by the crises economy elements.

Consulting employees is an integrated part of the HR customized solutions. Human operators should be informed concerning the evaluation and preventive measures to be taken. Risk assessment helps to minimize the possibility of workers errors during the design and implementation of general and specific strategies, to the working environment as a result of activities related improvement. It also helps maintaining competitiveness and productivity of the company, thus there are known the financial analysis that are revealing that major losses due to occupational errors.

Thus, we have found very profound the analysis of HR strategies going beyond managing customized HR solutions.

JEL CODES: E24, J24, O15.

KEYWORDS: HR strategies, customized HR solution, economic contextual conditions, fields of improvement, strategic and operational needs.

INTRODUCTION

Most of the companies, after a secure analysis, are deciding to outsource some key direction within the company. One particular field is mostly the HR activity, as per the high experience of the specialized HR companies, thus a part of the firms' strategies are going above and beyond in managing customized HR solutions, but mostly for companies that are motivated to reduce costs in payroll processing, workers' compensation, employee benefits, human resource management, employee liability, and other related HR responsibilities.

The specialized firms' professionals enable small business owners to focus on their core competencies, rather than focusing on running payroll, providing employee benefits, or the many other facets of human resource administration.

Therefore, all areas that have a great impact upon human resources interests and capacities materialized into professional competence, are being taken into consideration by the specialized firms. Being to big of an effort for a single Human Resources Department to manage all fields of expertise at a high level.

Thus, the optimal decision is under contracting specialists that are fully loaded with innovative solutions ex post the elementary and specific analysis as per the outline of the human capital development strategies focused on their dimensions in terms of strategic and operational needs.

THE ECONOMIC EXTERNAL AND INTERNAL CONTEXTUAL CONDITIONS FOR MANAGING HR SOLUTIONS

The relevant aspect, from this point of view, as the change is a permanent characteristic of humankind, consists in the establishment and development of new processes, which generate radical changes in the configurations of the workforce and the socio-occupational and socio-professional structures.

These new processes are, in fact, the expression of new types of social actions promoted by various social actors, which hold various places in the power relations. Analyzing today's world processes and tendencies, we shall highlight the complementary processes sets with the alternative and opposition elements.

Essentially, strategies to promote human capital focuses on the sizing of human capital in terms of strategic and operational needs of the national economy and ensuring efficient use of these resources.

Developing such strategies will build strategies for economic development through the establishment of future requirements for capital, by identifying top ways to use of this capital, where available human capital will support the implementation of plans for economic development.

However, it should be maintained the aspect that there are certain restrictive barriers in the use of human capital, being offered for instance, according to literature specialists: the deficit of qualified personnel, difficulties in recruiting labor, low labor productivity, insufficient flexibility and adaptability or the climate that discourage human operator's cooperation and commitment.

For being economically competitive on the European Union market we have put on these market reliable products at the requested standards. Regarding the human resources, the reliability materializes into professional competence. The "Bologna Process" offered us the reference points for reorganizing the university studies structure in order to be able to distinguish the qualification levels closely connected to the labor market requests.

Labor fields (sectors, employers, trade unions) can be described as the relation between offer and demand. Labor markets function through the interaction of workers and employers. And in the context of Romania Accession to the European Union we can discuss about the relation between Romania's workers and European Union employers or vice versa.

In this regard, consultation with users is almost a conventional wisdom among practitioners of human capital-technology interaction. However, the validity and reliability of techniques used in consultation with users are questionable.

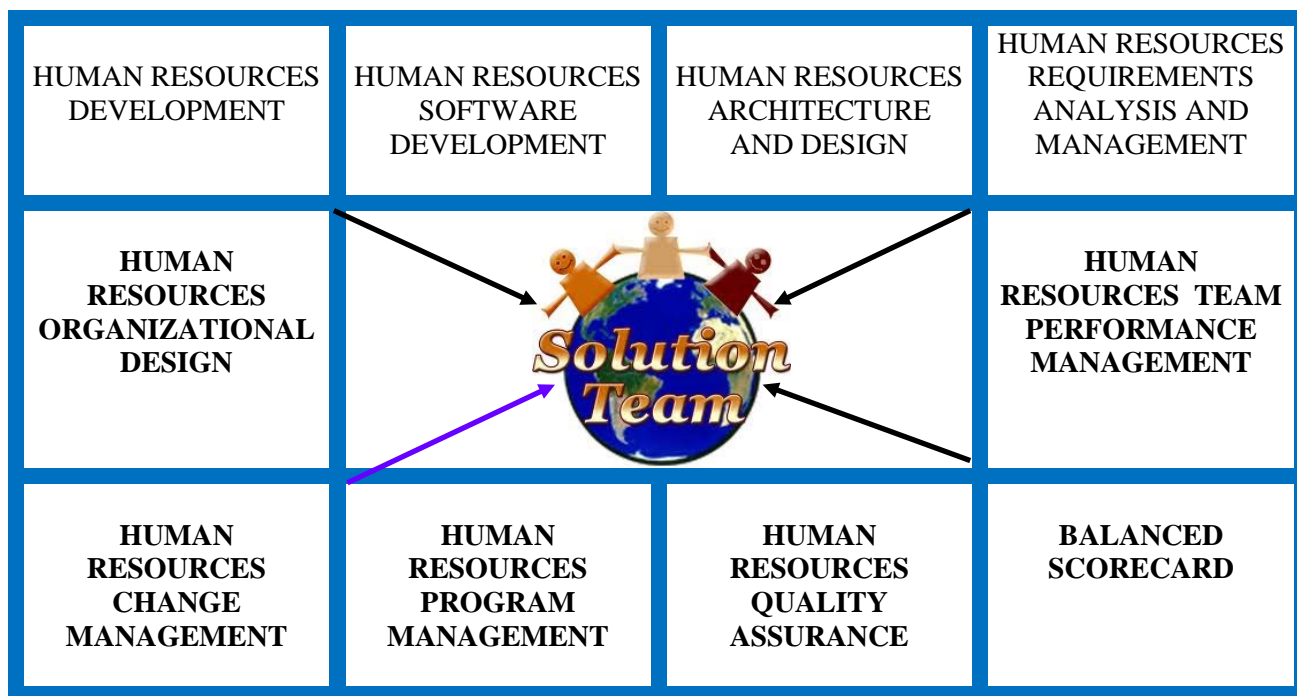

Focus groups, for example, are sensitive to a confusing number of factors: how would the results of a group, which can depend on the assessment made by a person who is leader of the group be and how the questions or topics chosen for discussion would be. Because the researcher is also part of the group, its interests, lack of attention, sensitivity to build language and other forms of nonverbal communication can influence the outcome.

Focus groups have the advantage that it offers troubleshooting problems and difficulties in identifying the user, which would be harder and more expensive to be investigated by observation. Multiple users at the same time can summarize experience in computing, over longer periods of time. Moreover, some problems may occur less frequently and can be easily omitted during a shorter period of observation.

HR PARTICULAR FIELDS OF IMPROVEMENT WITHIN A COMPANY

Progress can be seen in the deployment of stress and utility, valid and reliable measurement scales, which adopts a pragmatic approach to their work focusing on design rather than on cognitive theories.

Figure 1. HR particular fields of improvement, Source for inside images: <http://www.solteamint.com/default.aspx>

Another relevant issue of exogenous variables codification is that the risk assessment is not necessary to be done in isolation by the employer or employer representative. Thus is necessary the involvement of all employees and their representatives.

Consulting employees is an integrated part of the process - risk assessment. Human operators should be informed concerning the evaluation and preventive measures to be taken. Risk assessment helps to minimize the possibility of injury and damage to workers to the environment as a result of activities related to work. It also helps maintaining competitiveness and productivity of the company, thus there are known the financial analysis that reveals that major losses are due to occupational illness.

This may determine a financial reports crisis? As a conclusion we try to achieve an interconnection among the financial reports applied in knowledge organizations, the professional accountant and the financial accounting policy of the Romanian companies.

The accounting professional is expected to find personalized solutions to become a person who has the right to find and to reflect on the accounting approach of each transaction, to thoroughly analyze the processes and phenomena which will be found in the financial reports.

Therefore as a developed, well capacitated society, it must be recognized that: part of establishing a productive work environment requires a strong foundation of health and welfare benefits to provide the

employee, and their family as appropriate, with the knowledge that they are protected from significant risk in these areas. A company must offer the minimum retirement benefits required by country legislation or regulations.

Any program that provides benefits in excess of the required level must be shown to be a competitive requirement. And also, a company must support a wide range of employees' needs through a variety of paid and non-paid leaves, in order to reach the employees necessities.

Therefore, taking into consideration the poor quality employment programs existing at the national level, the intellectual capital took the decision to try finding a job abroad. At this decision the poor payment system and poor working conditions brought its strong influences.

HUMAN CAPITAL DEVELOPMENT STRATEGIES FOCUSED ON THEIR DIMENSIONS IN TERMS OF STRATEGIC AND OPERATIONAL NEEDS

In the light of these evolution, the core requirements, regarding migration control, should be included in the basic objectives of regional development policy and should set the direction lines towards reducing the existing regional imbalances, stimulating balanced development, revitalization of disadvantaged categories, prevention of new imbalances, regional development policies linking government development policies to stimulate interregional and international cooperation, that contributes to economic sustainable development.

In conclusion, it is also being reiterated its vitality as a sine qua non condition of inter-regional sustainable development, on promoting the principles of market economy mechanisms in all areas of the country, to improve competitiveness and achieve permanent economic growth, promoting harmonious development and growth of network of settlements, increasing the capacity of regions (in terms of institutional, financial and social decision making) to support their own progression process, creating equal opportunities in access to information, research and technological development, education and lifelong learning and training.

The human capital development strategies focuses on their dimensions in terms of strategic and operational needs of the national economy and ensuring efficient use of these resources. They will help formulate strategies for economic development through the establishment of future human capital requirements, by identifying ways to top use of this capital, where human capital will be available to support the implementation of plans for economic development. But it must be shown that there are stringent limits on the use of human capital, such as shortages of qualified personnel, difficulties in recruitment of labor, low labor productivity, lower flexibility and adaptability to climate or insufficient discourages cooperation and committed staff.

CONCLUSIONS

As recognition is being known worldwide as the greatest motivator and one of the greatest strengths of any organization are the people who work there, the necessity of implementing the new total rewards process becomes acute. Long-service employees provide the knowledge, experience, and attitudes that are responsible for much of digitalized societies success. In recognition of this, new total rewards are presented to eligible employees in celebration of their career milestones and to acknowledge their contribution to the company.

Therefore, sustainable development of human resources policies and strategies must take into account the upward trend and the trend of knowledge economy; inevitably it fits himself into this development, even if they change their causes, factors and their features. The global economic crisis is also part of the causes

generating the recovery needs to intensify intellectual capital performance. Only in this way by optimizing the growth of strategies productivity human resources, we can pave the way towards progress and prosperity, the economy became more complex, more dynamic and unpredictable.

Being much more easier and profitable to obtain a job abroad, young educated people are applying for working abroad first “just for the summer” and then are coming back to and still not finding a place to work are deciding to come back permanently to other countries, sharing their profitable stories to their relatives and friends that will be step by step embracing resigning and choosing joining the others abroad.

The impact of this phenomenon is felt strongly by reducing labor productivity and by the uncertainty regarding the development plan for medium and long term business, companies in the industry have tried to reduce labor turnover by offering bonuses directly linked to the same level of absenteeism and job seniority.

THE IMPACT OF ECUADOR'S DOLLARIZATION ON TRADE WITH THE US: 1965-2010

Christina Bova, Stetson University
Ranjini L Thaver, Stetson University

ABSTRACT

This paper analyzes Ecuador's dollarization effect on its import and export demand functions with the US from 1965-2010. The study uses the bounds testing approach to co-integration using an unrestricted error-correction model. Results indicate co-integration among the variables in the long run for both imports and exports trade with the US. Long-run and short-run partial elasticities of imports with respect to relative prices, real foreign reserves, exchange rate volatility, and GDP meet theoretical expectations and are mostly significant. Likewise, long-run and short-run partial elasticities of exports with respect to relative prices, exchange rate volatility, and GDP are significant and meet theoretical expectations. A dummy variable employed to capture the impact of dollarization on trade between Ecuador and the US shows that dollarization has had a significant effect on imports and exports in the short run only.

JEL Classifications: F14, F31, F39, O54

Keywords: Ecuador, United States, import demand, dollarization, exchange rate volatility

OBJECTIVE OF STUDY:

To determine the impact of dollarization on Ecuador's exports and imports with the US.

MODEL SPECIFICATION, DATA SOURCES, AND VARIABLES

The import demand function:

$$\ln M_t = \beta_0 + \beta_1 \ln RGDP_t + \beta_2 \ln RP_t + \beta_3 \ln FR_t + \beta_4 \ln VOL_t + \beta_5 D_{1t} + \varepsilon_t \quad (1)$$

With variables imports (M), real gross domestic product (RGDP), relative prices (RP), real foreign reserves (FR), exchange rate volatility (VOL), dollarization dummy variable (D_1), and the error term (ε). Concomitant with theory, we expect RGDP to impact imports positively, and therefore, $\beta_1 > 0$. RP_t , which measures the relative price of imports, is calculated as the ratio of import price to domestic price, and we expect an inverse relationship between the relative price of imports and imports so $\beta_2 < 0$. The third explanatory variable, FR_t measures the availability of foreign reserves. Since higher real foreign reserves tend to encourage imports, we expect $\beta_3 > 0$. However, the effect of VOL_t on imports has been found to be empirically and theoretically ambiguous (e.g. Bredin, et al. 2003), so β_3 could be either positive or negative. The last explanatory variable is a dummy variable, D_1 representing the dollarization of Ecuador, and is defined to take the value 0 for years between 1965 and 2000 and 1 otherwise. Since dollarization is assumed to affect the economy positively, the sign of β_4 is expected to yield a positive sign.

In estimating the long-run model outlined by Equation (1), we distinguish short-run effects from long-run effects by specifying equation (1) in an error-correction model (ECM) format following Pesaran, Shin, and Smith (2001). Using the bounds testing approach to cointegration analysis, we rewrite Equation (1) in an ECM format in Equation (2) below.

$$\Delta \ln M_t = \alpha_0 + \sum_{i=1}^n \beta_i \Delta \ln M_{t-i} + \sum_{i=0}^n \gamma_i \Delta \ln RGDP_{t-i} + \sum_{i=0}^n \delta_i \Delta \ln RP_{t-i} + \sum_{i=0}^n \eta_i \Delta \ln FR_{t-i} + \alpha_1 D_{1t} + \lambda_1 \ln M_{t-1} + \lambda_2 \ln RGDP_{t-1} + \lambda_3 \ln RP_{t-1} + \lambda_4 \ln FR_{t-1} + \omega_t \quad (2)$$

Except for the first difference operator, Δ in Equation (2), all variables have been defined previously. Equation (2) undergoes two procedural steps, the first employing the Wald test for the lagged level variables to test for the joint significance of the no cointegration hypothesis, $H_0 = \lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = 0$ against the alternative hypothesis of cointegration, $H_1 = \lambda_1 \neq \lambda_2 \neq \lambda_3 \neq \lambda_4 \neq 0$. Pesaran, et al. (2001) provides two sets of critical values for a given significance level with and without a time trend. One assumes that the variables are I(0), and the other assumes that the variables are I(1). If the computed F-value exceeds the upper critical bounds value, H_0 is rejected signaling cointegration among the variables, whereas if the computed F-value falls below the critical bounds value, we fail to reject H_0 . If the computed F-statistic falls within the bounds, the results are inconclusive. Once a cointegration relationship has been established, the second step involves estimating the long-run coefficients of the cointegrated model and the corresponding short-run dynamics, or ECM. The lagged error correction term (ECMt-1) in the ECM model is important for the cointegrated system as it allows for adjustment back to long run equilibrium after a shock in the system in the previous time period.

Equation (2) specifies that real imports are influenced and explained by its past values. From the estimation of ECMs, the long-run elasticities are the negative of the coefficient of one lagged explanatory variable divided by the coefficient of one lagged dependent variable (Bardsen, 1989). The short-run effects are captured by the coefficients of the first-differenced variables in Equation (2).

The export demand function:

$$\ln X_t = \beta_0 + \beta_1 \ln Y_t + \beta_2 \ln RP_t + \beta_3 \ln VOL_t + \beta_4 D_t + \varepsilon \quad (3)$$

With variables exports (X), domestic real gross domestic product (Y), relative prices (RP), exchange rate volatility (VOL), dollarization dummy variable (D_1), and the error term (ε). Y impacts exports positively, and therefore, $\beta_1 > 0$. On the other hand, if the relative price of exports rise (fall), domestic goods become less (more) competitive than foreign goods, causing the demand for exports to fall (rise). Therefore, one would expect that $\beta_2 < 0$. The effect of VOL_t on imports has been found to be empirically and theoretically ambiguous (e.g. Bredin, et al. 2003), so β_3 could be either positive or negative. The last explanatory variable is a dummy variable, D_1 representing the dollarization of Ecuador, and is defined to take the value 0 for years between 1965 and 2000 and 1 otherwise, is assumed to impact the economy positively and therefore the sign of β_4 is expected to yield positive results.

In estimating the long-run model outlined by Equation (3), we distinguish short-run effects from long-run effects by specifying equation (3) in an error-correction model (ECM) format following Pesaran, Shin, and Smith (2001). Using the bounds testing approach to cointegration analysis, we rewrite Equation (3) in an ECM format in Equation (4) below.

$$\Delta \ln X_t = \alpha_0 + \sum_{i=1}^n \beta_i \Delta \ln X_{t-i} + \sum_{i=0}^n \gamma_i \Delta \ln Y_{t-i} + \sum_{i=0}^n \delta_i \Delta \ln RP_{t-i} + \sum_{i=0}^n \eta_i \Delta \ln VOL_{t-i} + \alpha_1 D_{1t} + \lambda_1 \ln X_{t-1} + \lambda_2 \ln Y_{t-1} + \lambda_3 \ln RP_{t-1} + \lambda_4 \ln FR_{t-1} + \omega_t \quad (4)$$

As in the import demand function, we employ the Wald test for the lagged level variables to test for the joint significance of the no cointegration hypothesis, $H_0 = \lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = 0$ against the alternative hypothesis of cointegration, $H_1 = \lambda_1 \neq \lambda_2 \neq \lambda_3 \neq \lambda_4 \neq 0$.

EMPIRICAL RESULTS

Cointegration among Variables

Table 1 shows the results of the co-integration test for the import and export demand functions. The calculated f-statistic in both models are above their upper bounds limit at the one percent level, signifying co-integration among dependent and independent variables in both import and export demand functions. Therefore, the null hypothesis is rejected, and we may estimate the long-run and short-run partial elasticities of the two functions.

Table 1. *F*- test Results for Cointegration of the Import and Export Demand Functions

Critical value bounds of the F-statistic: intercept and no trend						
K	10 percent level		5 percent level		1 percent level	
	I(0)	I(1)	I(0)	I(1)	I(0)	I(1)

4(EXPORTS)	2.45	3.52	2.86	4.01	3.74	5.06
Calculated F-statistic:						
IMPORTS:	$F_M(M RGDP, RP, FR, VOL, D)$				6.421398***	
EXPORTS:	$F_X(X Y, RP, VOL, D)$				7.235638***	

*Note: This table shows the results of the ARDL bounds testing for cointegration. The Critical values are taken from Pesaran, Shin, and Smith (2001, Table CI(iii) Case III, p. 300). k is the number of regressors. *** indicates the statistical significance at the 1 percent*

Long-Run and Short-Run Elasticities

Table 2 reveals that long run import elasticities estimates are mixed. Only GDP, RP and FR are significant, while it seems that GDP affects imports negatively, which contradicts theoretical expectations. In the exports model, only VOL is significant and elastic with a 1% change leading to a change in exports of 1.9%. Surprisingly, in both the imports and exports models, dollarization has not had a significant long run impact on imports and exports.

$\Delta \ln VOLT_{t-2}$	-0.01479	-0.435	D_t	0.2122*	2.174
D_t	0.8251***	4.513	ECM_{t-1}	-0.06265***	-5.651
ECM_{t-1}	-0.9592***	-6.044			

Note: This table shows the results of the short-run elasticities of the error-correction model.***, **, and * indicate statistical significance at the 1% 5%, and 10% level, respectively.

As in the long run, Table 3 reveals that short run import elasticities estimates are mixed. Only GDP, FR and D_1 are significant. As in the long run, GDP affects imports negatively, but elastically. In the exports model, except for domestic income, Y , all the other estimates are significant. Contrary to the long-run, however, dollarization has a significant short run impact on imports and exports, albeit it inelastically. The coefficient for ECM_{t-1} in the imports model is very high at 0.9592, indicating that once the model in Equation (2) is shocked, convergence to equilibrium is very fast with 96% of adjustment occurring in the first year. ECM_{t-1} in the exports model is extremely low 0.0625, indicating that convergence to equilibrium after a shock is very lethargic with only 6% of adjustment occurring in the first year.

The diagnostic tests for both models reinforce the results associated with the error correction model. In the case of imports, all the diagnostic tests reveal that the model is well specified and well-behaved. In the case of the exports model, this is not the case, with most of the results indicating that the model is not well-behaved.

Table 4. Results of the Diagnostic Test for the Selected ARDL Model

Explanatory Variables	Imports		Exports	
	Coefficient	p-value	Coefficient	p-value
R^2	0.9388		0.9852

WORKING PAPER CONCERNING THE OUT-OF-THE-BOX THINKING UPON HR POLICIES AND PROCEDURES EVALUATION

Elvira Nica, the Academy of Economic Studies, Bucharest
Gheorghe H. Popescu, Dimitrie Cantemir University, Bucharest
Alexandra Mironescu, Romanian-American University, Bucharest

ABSTRACT

The present article is focused on the innovative HR strategies so much needed in the current economic and social companies 'crashes. Therefore we see the reengineering of the human capital management as a process that needs out-of-the-box-thinking in terms of strategic improvement. From the need for growth of viability of existing human capital interaction systems and from the need of providing a favorable context for designing new systems in order to reduce and even eliminate the likelihood of human error and technological occurrence risk, it is initially imposed the assessment of human resources existing required conditions of work in the organization, the degree of involvement of human factor in decision making on the work systems modernization and automation assessment and last but not least assessing the usefulness of new systems to identify problems and difficulties arising in using the components of complex systems, such as proposing a system that promotes human capital-technology interaction in reliability and safety conditions. Thus, we consider necessary in the future to increase the interest of Romanian economic agents to call on the professionalism of HR professional specialists, a fact made possible by a selection more accurate of those who practice this profession and embracing the out-of-the-box thinking. The importance of knowledge and application of basic principles governing HR policies and procedures represent the surety of a modern and efficient professionalism, getting the highest requirements.

KEYWORDS: innovative strategies, out-of-the-box thinking, HR policies, HR procedures, designing new systems.

INTRODUCTION

"Thinking outside the box" and "thinking beyond the box" (also called "thinking out of the box" or "thinking outside the square") is to think differently, unconventionally, or from a new perspective. This phrase often refers to novel or creative thinking.

The metaphorical "box" in the phrase "outside the box" may be married with something real and measurable — for example, perceived budgetary or organizational constraints in a development project. Speculating beyond its restrictive confines the box can be both: positive— fostering creative leaps as in generating wild ideas (the conventional use of the term) and negative— penetrating through to the "bottom of the box." James Bandrowski states that this could result in a frank and insightful re-appraisal of a situation, oneself, the organization, etc. On the other hand, Bandrowski argues that the process of thinking "inside the box" need not be construed in a pejorative sense. It is crucial for accurately parsing and executing a variety of tasks — making decisions, analyzing data, and managing the progress of standard operating procedures, etc, as per Wikipedia.

THE GENERAL INTEREST GLOBALIZED ECONOMY CIRCUMSTANCES

Under the circumstances of the complete integration within the European Union structure, global economy can be related to other social factors, which shall continue and extend the context of certain new requirements and opportunities in the field of employment policies.

Under these circumstances, the globalized economy becomes a major dimension of a globalized world, in which major problems of mankind become global problems and impose the connection between the globalized and local solutions, thus creating a new context for employment policies.

These facts being given it is vital for university studies structure to be redefined only from the labor market demands point of view. In order to do that, first, we have to take into reflection the globalization trend that shows us that we have to establish a connection between Romania's Labor Market and European Union Labor Market.

Therefore, human capital represent the amount of all knowledge skills, skills and competences acquired by the consumer directly to educational services, put forward the production capacity of the economy, whose main feature are sustainable development and maintaining quality of life for human factors.

From this perspective, human capital is indeed subject to depreciation. For this reason a decision for sizing the investment in human capital is rigorously analyzed, along with putting into balance the perspectives offered by various alternatives, and bringing into the equation the financial and non-financial efforts and the possible resulted effects.

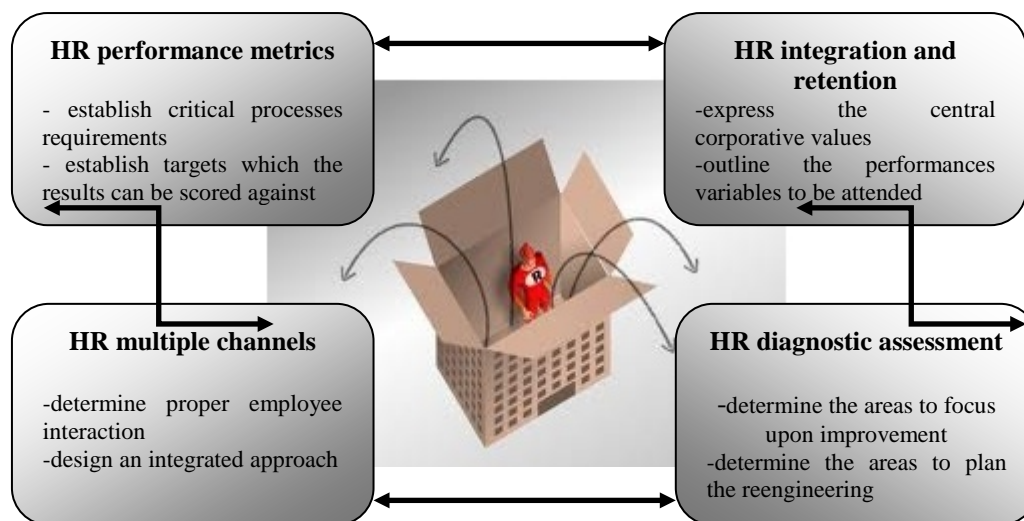

The binding agent between the two markets is no other than European Qualification Framework. What other better way to follow in the context of globalization, than to have common settlements? Putting into use the European Qualification Framework will facilitate labor market mobility across borders, using the communication between systems, following the transparency and the recognition of studies and competencies at a European level.

From the need for growth of ergonomic viability of existing human capital-technology interaction systems and from the need of providing a favorable context for design of new systems in order to reduce and even eliminate the likelihood of human error and technological occurrence risk, it is initially imposed the assessment of human resources existing required conditions of work in the organization, the degree of involvement of human factor in decision making on the work systems modernization and automation assessment and last but not least assessing the usefulness of new systems to identify problems and difficulties arising in using the components of complex systems, such as proposing a system that promotes human capital-technology interaction in reliability and safety conditions.

THINKING OUT-OF-THE-BOX COMMITMENT

Strategies for human capital development are focusing on the dimensions of human capital in terms of strategic and operational needs of the national economy and ensuring efficient use of these resources. They will help formulate strategies for economic development through the establishment of future human capital requirements, by identifying ways to use top of this capital, where human capital is available to support implementation of plans of economic development.

But we have shown that there are stringent limits on the use of human capital, such as shortages of qualified personnel, difficulties in recruitment of labor, low labor productivity, flexibility and adaptability to climate insufficient or discourage cooperation and commit personnel.

Figure 1. HR innovative strategies for sustainable growth, Source: <http://www.outbsolutions.com/>

Accordingly, from the human operators perspective to simplify tasks and constant updating of exogenous variables generating professional risks and illnesses and also for increasing the efficiency of the system application to prevent them, it is necessary to create a software application that allows automation of many operations involved in processing results evaluation and creation of a database on assessments of the economic unit, with the possibility of tracing the evolution in time of the security level for a particular job. Access to information in real time, is a requirement of all this activity and a result of the participation of all humans within the organization.

The basic objectives and principles are not intended to be used to solve the ethical problems of professional accountants in a well determined case. However, the Code provides specific guidelines regarding the implementation in practice of fundamental principles and objectives on the number of typical situations that meet in the accounting profession.

Thus, we consider necessary in the future to increase the interest of Romanian economic agents to call on the professionalism of HR professional specialists, a fact made possible by a selection more accurate of those who practice this profession. The importance of knowledge and application of basic principles governing the accounting profession represent the surety of a modern and efficient professionalism, getting the highest requirements.

A base pay program, along with other elements of total rewards, enables the company to attract, retain and motivate talented and diverse workforce inside a company. As part of total rewards within the digitalized societies, providing a base pay intended to attract and retain a competitive workforce will make the differences between employees.

The digitalized societies, and not only, should use data from relevant markets to construct competitive pay ranges. Increases in base pay must be driven primarily through an annual performance. Increases are funded based on business performance, affordability, and investment trade-offs within the total rewards program. In addition to the above, adjustments in base pay are influenced by individual performance relative to the other members of the work team.

NEW HUMAN RESOURCES STRATEGIES FOR A NEW WORKING ENVIRONMENT

Also, focusing on the development of modern information capacity supports the access to external workforce markets and use of modern instruments for export promotion, doublet by getting support for participation in fairs, exhibitions can be a good start in rethinking the business area, with the following positive effects like increasing the number of jobs and simultaneously reducing the unemployment ratio. In the context of a competitive pressures, commercial firms, and in particular the distribution pipes, are required to continuously develop innovative strategies and continuous diversification of activity, products and services offered, prices and information necessary for dialogue with consumers. And for this, it is needed a qualified workforce. Investing in human capital can, without any further ads, raise a company to its highest level of performance. In the social area, the economic growth of a company means new hiring, as a consequence of its expanding business areas.

Continuing on the same line, of finding strategic measures, which may lead to frontloading the unemployment growth, we find the need for public simplifying and correlating fees, integrating systematic consultation with the private sector, sustaining professional bodies and employers' strategy to boost exports, also sustaining the strategy to attract foreign investment and modernize the business are by updating it with know-how technology.

In the context of the smoothing the capital flow movement at global level sizes we are witnessing at the transformation of dimensions, forms of organization and management of firms and corporations, and the shift towards a new dimension of development strategies and policies for conducting business, having as that central pillar the intellectual capital.

Thus, in the circumstances of companies development from national to multinational, moral values and rules governing the economic game take birth under the aegis of competitive advantage, for the purpose of survival in a world market based on knowledge. From this perspective, social responsibility and ethical obligations of companies become more complex and dynamic than they have ever been before.

The transition from industrial economy to knowledge-based economy determines the incorporation of certain normative values of local business environments and their translations into a multinational and multicultural environment, based on economic sustainable development criteria more than on the moral correctness, which still show an increased dynamics.

The main factors influencing the efficiency of commercial enterprises are: the volume of goods sales or volume of trading, the size of trade margins charged by commercial enterprises, the size of commercial pricing, spending that movement, human resources, financial and material used in trade ; structure of groups of goods outlets, labor productivity, the forms of movement of goods, technical progress, movement speed, level and enterprise level management of business units, business staff incentives, forms of pay prevailing in trade; degree use of labor utilization of technical-material base, utilization of financial resources, level of organization of sales of goods, commercial technologies used, the training of commercial workers, the structure optimization staff. It is therefore apparent that endogenous and exogenous variables row are interconnected and interdependent, the central pillar being represented by the supreme factor: the intellectual capital.

CONCLUSIONS

New human resources strategy should support actions to increase labor market participation and measures to increase the attractiveness of the workplace, by promoting a friendly work environment and improving quality and productivity at work.

However, increasing adaptability of workers involves promoting entrepreneurial culture, knowing that we face a dynamic economic environment, prepared to cope with rapid change caused by opening markets and expanding globalization, thus it requires managers who know how to make the optimal use of existing market opportunities and are the success factors of a business. Achieving a high employment and avoid the trap of inaction is essential for persons faced with the prospect of long-term unemployment, especially youth and elderly unemployed.

Establishing priorities, strategy directions, strategic objectives, operational plans, assessment and control plans and performance indicators must take account of changing endogenous and exogenous variables of the public servant itself.

Furthermore, the economic growth of a country or a public sector may be related, in terms of human resource utilization, to the increasing number of employees or to the better use of the existing employees. Therefore, a thorough analysis of the performance scale periodical is required for each public servant, in the dimensioning of proactive involvement in specific activity.

A UNIVERSITY BASED MICROFINANCE PROGRAM BLUEPRINT FOR MICRO-BUSINESS DEVELOPMENT TRAINING

Ranjini L. Thaver, Stetson University, Deland, Florida

Neal B. Long, Stetson University, Deland, Florida

ABSTRACT

Microfinance is a program based on social collateral offering small amounts of capital to the poor to enable them to generate their own income through self-employment. Holistic microfinance also supports clients through business development training and mentoring. Microfinance, also referred to as microcredit, has been identified as one of the most widespread and dynamic approaches to poverty alleviation all over the world. The principle upon which it is based is that the poor are no less entrepreneurial than the affluent, but unlike the latter, they lack access to credit from commercial banks because they are deficient in financial collateral. For this reason world institutions have committed to the goals of microcredit include, among others, commercial banks, credit unions, savings banks, non-governmental organizations, local and regional government agencies, developmental organizations, corporations, religious institutions, service clubs and other advocates. Educational institutional commitment has mostly taken the form of research into the theoretical and empirical evaluations of the successes and failures of microfinance programs. However, universities, in addition to their academic roles, are uniquely situated to take a participatory role in microfinance outreach in their communities. The objective of this paper is to provide a case study of Stetson University's microcredit program and to provide a blue-print on how to create a business development workshop series to support very small entrepreneurs in their communities.

VAR AND CVAR IN THE ASSET PRICING OF CROSS SECTIONAL RETURNS: A STUDY ON THE SBF 250 STOCKS

Houda Hafsa, Aix-Marseille University (France) & Carthage University (Tunisia)

ABSTRACT:

This paper analyses the risk-return trade-off for equities of the SBF250 index during the period 1987-2009. The risk measures considered are the beta of the CAPM, the value at risk (VaR) and the conditional Value at risk (CVaR). To estimate the VaR and the CVaR, we adopt a non parametric and a parametric method (normal approach and Cornish-Fisher approach). Using cross sectional regressions at the individual equity level, we find that the CAPM beta provides insignificant results and that the left-tail risk captured by VaR explains significantly the cross sectional variation of daily returns and outperforms the Conditional Value at Risk. The study provides another interesting result: the normal approach is superior to the Cornish-Fisher approach in estimating the VaR and the CVaR. The results are unexpected and contradict the theoretical arguments suggesting that the CVaR and the VaR based on the Cornish-Fisher expansion are better measures of risk when returns are non-normal as they allow capturing the characteristics of the empirical distribution of returns. One plausible interpretation of these findings is that the extreme losses greater than VaR are viewed as infrequent fluctuations which does not have significant power in explaining the cross sectional returns. To check the validity of the empirical results on the French Market, we conduct a robustness test using the S&P500 stocks. The results are considerably different and are rather in line with theoretical predictions.

INTRODUCTION

Two very important papers on portfolio selection were published in 1952, first Markowitz paper on portfolio selection in classical portfolio theory; second Roy's paper on safety first which led to the development of downside risk measures. The difference between these two approaches according to classical portfolio theory is that an investor constructs a portfolio that represents a tradeoff between risk and return. The tradeoff between risk and return and the portfolio allocation depend upon the investor's utility function which depends only on the expected return and volatility as it presumes that returns are normally distributed. However, a large empirical literature fails to agree with this assumption and suggests that higher order moments must be considered to describe adequately the distribution of returns. Another drawback of this classical theory is that it can be hard or impossible to determine an investor's actual utility function.

Instead, Roy (1952) argued that an investor rather than thinking in terms of utility functions, first he wants to preserve a certain amount of the principal. Thereafter, he decides on some minimal acceptable return that achieves this principal preservation. Roy pointed out that a safety-first investor minimizes the probability of going below a certain target return or disaster level.

One of the most well-known measures of downside risk is the Value at risk or VaR. This tool was introduced by the JP Morgan American Bank in the beginning of the 90's. In a first time it was used to measure the market risk to which are exposed the bank portfolios. Then it was made available through the

RiskMetrics software and it was adopted as a primary risk metric in Basel Accords. Since that, it has risen to a high level of prominence as a measure of risk that it is “widely used by corporate treasurers and fund managers as well as financial institutions” (Hull, 2007).

Jorion (1997) defines the VaR as the loss that will not be exceeded over a certain time horizon, at a specified confidence level, due to exposure to market risk. For example a 99% VaR for a 10-day holding period implies that the maximum loss incurred over the next 10 days should not exceed the VaR limit once in every 100 cases.

Formally the VaR is defined as: $VaR_\alpha = \min\{R | P(R_p \leq R) = 1 - \alpha\}$, where P denotes the probability function. α is the confidence level, typical value of α that commonly considered are, 95% and 99%. R_p is the return of the portfolio P and R is the threshold return.

This simple definition constitutes one principal attraction of the VaR. It represents an easily interpretable summary measure of risk and also has an appealing rationale, as it allows the user to focus attention on “normal market conditions “in their routine operations (Basak and Shapiro, 2001).

The VaR enjoys many other incontestable appeals compared to the variance, the most known measure of risk. In fact, the variance assumes that investors weigh the probability of negative returns similarly as the probability of positive returns. However there is a stylized fact that financial returns are not necessarily normally distributed but exhibit non trivial skewness and kurtosis. Furthermore, there is ample evidence that agents often treat losses and gains asymmetrically. Therefore, in the case where returns are non-normal, the choice of the VaR as a measure of risk may be the best way to measure the portfolio risk. This enables a much more generalized framework to be developed and to leave the distributional assumption about the structure of tails of the distribution. In addition, the variance gives, only, information about the variations of returns compared to the mean, whereas VaR gives a perception of the magnitude of possible losses that are important for the investor.

Unfortunately, the ease and intuitiveness of VaR are counterbalanced by its mathematical properties. Rockafellar and Uryasev (2000) show that, as a function of the confidence level, for discrete distributions, VaR lacks of convexity, discontinuity and monotonicity (Alexander and Baptista, 2004, Artzner, Delbaen, Eber and Heath, 1999). Consequently, it cannot be easily optimized using the linear programming approach. Other researchers have extensively criticized the use of VaR as a measure of risk. For instance, Artzner, Delbaen, Eber and Heath (1997, 1999) show that VaR is not a “coherent” measure of risk because it fails to satisfy the “sub-additivity property” for non-normal distribution. This means that the risk of a portfolio is less than or equal to the sum of the risk of individual securities in the portfolio. Intuitively, sub-additivity requires that VaR should consider reduction of risk by the effect of portfolio diversification. Basak and Shapiro (2001) show that when an agent faces a VaR constraint at the initial date in a continuous-time model, the agent may select a larger exposure to risky assets than he would have chosen in its absence.

Furthermore, VaR entirely ignores the severity of the tail scenarios that occurs with a probability equal to the disaster level and does not provide any information about the amount of loss exceeding VaR. For example, we can significantly increase the largest loss exceeding VaR, but the VaR risk measure will not change. According to Sarykalin, Serraino and Uryasev (2008) the indifference of VaR to extreme tails may be quite an undesirable property, allowing to take high uncontrollable risks ; For portfolios with skewed distributions, risk management using VaR may result in a significant increase in high losses (Basak and Shapiro, 2001).

In the other side, Sarykalin and al. (2008) suggest that the indifference of VaR risk measure to extreme tails may be a good property if poor models are used for building distributions of future outcomes, explaining that VaR disregards some part of the distribution for which only poor estimates are available. In such cases, VaR estimates are statistically more stable than CVaR estimates. This actually may lead to a superior out-of-sample performance of VaR versus CVaR for some applications. They give the example for a portfolio involving instruments with strong mean reverting properties and argue that VaR will not penalize instruments with extremely heavy losses and they conclude that in statistics, estimators based on VaR are “robust” and may automatically disregard outliers and large losses.

Face to the shortcomings of the VaR, an alternative measure of risk called Conditional Value at Risk (CVaR) was introduced by Rockafeller and Uryasev (2000). The CVaR measures the expected loss in the left tail given (i.e. conditional on) a particular threshold that has been met, such as the worst 1st, 5th or 10th percentile of the distribution of possible future outcomes, it quantifies losses exceeding VaR and acts as an upper bound for it. Formally, CVaR equals the average of some percentage of the worst-case loss scenarios.

There are several reasons why CVaR is a preferred risk measure to VaR. To begin, contrary to the VaR, the CVaR enables to distinguish between two distributions having the same p-quantile but are different otherwise (i.e having different tails or asymmetric coefficient). Consequently, the CVaR is as much preferable as the distributions move away normality and characterized with strong asymmetry and fat tails.

Furthermore, CVaR is a sub-additive measure of risk compared with VaR and is a “coherent” measure of risk in the sense of Artzner and al. (1999). These properties were first proved in Pflug (2000) then in Accerbi and Tasche (2002). Moreover, under quite general conditions, CVaR is a convex function with respect to positions and can be easily minimized using linear programming approach, allowing handling of portfolios with a large number of instruments and scenarios (Rockafeller and Uryasev, 2001). Rockafellar and Uryasev (2001) also showed that CVaR is superior to VaR in optimization applications.

Recently, the use of VaR and CVaR as tools in financial risk management and regulating credit risk has been quite popular in academic literature. Most of studies that examined the validity of these risk measures focused on their practical, statistical and computational difficulties. Other papers have investigated them on the context of portfolio allocation. Only few studies have investigated their merits in asset pricing issues.

The remainder of this paper is organized as follows. Section 2 presents a brief review of the empirical literature concerning the use of VaR and CVaR in asset pricing. Section 3 presents the used data and methodology and different empirical analysis of the cross section returns on the French market. In section 4, we conduct a robustness test using data on the US Market. Finally section 5 concludes the paper.

VaR AND CVaR MERITS IN ASSET PRICING: EMPIRICAL LITERATURE

Kaplanski (2004) is one of the pioneer papers that analyses the validity of VaR measures in explaining returns in comparison to traditional risk measures. Kaplanski (2004) develops downside risk asset-pricing model based on CVaR. His model leads to a monetary separation and yields a CVaR beta similar to the traditional beta. An empirical study indicates that CVaR beta, which considers also downside risk, has greater explanatory power than the traditional beta especially for bearish market. Moreover, a multivariate model, which uses both traditional beta and CVaR, outperforms both the traditional and the CVaR models. The results indicate that in a bullish economy, risk premiums may be partially explained by the traditional beta. However, in depressed economy investors are most likely more concerned about downside risk, which is poorly captured by the traditional beta. This downside risk can better be captured by CVaR beta, which is based on historical data and avoids assuming any prior distribution. Bali and

Cakici (2004) examined the cross-sectional relation between VaR and expected returns on individual stocks trading at NYSE, AMEX and NASDAQ. The study indicates a strong positive relationship between average returns and VaR for different investment horizons and loss probability levels.

Liang and Park (2007) analyzed the risk-return trade-off in the hedge fund industry. They compared value-at-risk (VaR), CVaR and other downside risk measures with standard deviation at the individual fund level as well as the portfolio level. They find that the left-tail risk captured by CVaR explains the cross sectional variation in hedge fund returns very well, while VaR and the other risk measures provide statistically insignificant or marginally significant results. This study provides empirical evidence on the theoretical argument advanced by Artzner et al. (1999) that CVaR is superior to VaR as a downside risk measure.

Recently Bali, Demirates and Levy (2009) examined the intertemporal relation between downside risk and expected stock returns. VaR and CVaR, among other downside risk measures, are used to determine the existence and significance of a risk-return tradeoff for several stock market indices. They find a positive and significant relation between downside risk and the portfolio returns on the NYSE/AMEX/NASDAQ stocks. Such result also holds for the NYSE/AMEX, NYSE, Nasdaq, and S&P 500 index portfolios. Moreover, they find that VaR remains to be a superior measure of risk even when it is compared to the traditional risk measures which have significant predictive power for market returns. The results of this study are robust across different loss probability levels, and also after controlling for macroeconomic variables associated with business cycle fluctuations. Another interesting result shows that incorporating left tail risk measured by the expected CVaR does not improve the explanatory power of the predictive regressions.

As we can notice from literature review, the problem of choice between VaR and CVaR in financial management has been quite popular in academic literature, but remains less recurrent in the asset pricing framework. We try to examine the cross relation between these measures and expected securities returns and to compare their predictive power and to reveal which of these risk measures captures better the cross sectional variation in securities returns when returns are non-normal.

Our empirical study employs the most used methods to estimate VaR and CVaR. Essentially, we use the cross section daily stock returns on the French market over the period 01/1987-12/2009. For the cross sectional analysis, we use the Fama and MacBeth Methodology. This paper may be a contribution to improve the literature on asset pricing using VaR and CVaR measures that take account for the non normality of return distribution which is a stylized fact in financial literature. To the best of our knowledge, this paper is the first that compares empirically alternative risk measures to explain the cross-section of returns on the French Market.

VaR AND CVaR AND THE CROSS-SECTION OF EXPECTED STOCK RETURNS: EVIDENCE FROM THE SBF250

Data

The study explores daily security returns in the French market. The test period spans from January 1987 through December 2009 including the bear markets of 1987, 2000-2001 and 2009. To estimate the concerned risk measures, an estimation period of three years is chosen. So, the data extends from January 1984 to December 2009.

We consider all stocks of the SBF250 index which entered the index before the 1st of January 2000 (the SBF250 composition is not available before this date) and were conserved until 31/12/2009. This screening process yields to a sample of 38 stocks. The daily data on closing prices and dividends are

collected from the Datastream database. The 3-months Treasury bill is chosen to proxy the risk free rate and the average return of the selected stocks to proxy for the market return.

Summary statistics (not reported here but available upon request) show that the daily returns have modest negative asymmetry in the sense of skewness. The values of excess kurtosis indicate clearly that all stocks have leptokurtic behavior which is described by fat tails in the literature. The results of Jarque Bera joint test of normality are consistent with the results of the skewness and kurtosis, strongly rejecting normality for all selected stocks at the 1% level. Thus the main features of data are that returns are slightly asymmetric and have fat tails. This first empirical result justifies the choice of the method for the VaR and CVaR estimation.

Methodology

This paper employs Fama-MacBeth (1973) regressions often adopted by cross sectional studies to examine whether the traditional beta, VaR and CVaR can provide significant cross-sectional variations in expected stock returns. For each stock the risk measure is estimated using time series data over the previous 3-years period (estimation period). Then, for each day inside the period 02/01/1987-31/12/2009, security returns in the subsequent testing period are cross sectionally regressed on the risk measure estimated over the previous estimation period. We repeat this process for all days in the sample period producing 5803 sets of coefficient estimates. We then average the T estimates to produce a sample of Fama-MacBeth coefficient estimates and then test their statistical significance using the Student Fama-MacBeth t-statistic. Daily cross-sectional regressions are run for the following econometric specifications:

$$R_{j,t+1} = w_t + \gamma_t X_{j,t} + \varepsilon_{j,t+1}$$

Where $R_{j,t+1}$ is the realized return on stock j in day t+1 and $X_{j,t}$ = beta, VaR or CVaR estimated over the three years preceding estimation date t.

Concerning the choice of the estimation period, longer historical sample periods result in less variability in the VaR estimate and potentially violate the assumption of iid observations whereas short sample periods could reduce the precision of the estimate (Butler and Schachter, 1998). We reiterate tests for estimation period of one year and five years. Qualitative results (not reported here) are very similar to those found for the estimation period of three years.

Concerning the risk measures estimation, several methods are proposed to estimate VaR and CVaR in the literature. In this paper we use both parametric (normal and Cornish-Fisher approaches) and non-parametric methods to estimate VaR and CVaR for three confidence levels (1%, 5% and 10%) and for 1-day horizon, using daily returns.

Empirical Results

Table 1 reports results of univariate regressions respectively using the traditional beta, VaR and CVaR. Panels A, B and C show results for 1%, 5% and 10% confidence level respectively. The results of Table 1 indicate that the beta fails to explain the cross sectional variations of returns. This poor performance could be due to the slightly negative skewness and considerably high kurtosis. Meanwhile assuming normality of returns could underestimate the risk.

The comparison between the results across the 3 panels of table 1 indicates that when the VaR and CVaR present statistically significant explanatory power, they are more performant when we use a confidence level of 95%. This finding is in line with results of previous studies that show that a confidence level

close to 0 or 1 provides imprecise estimation of VaR (Dowd, 1998). Furthermore, we find that the normal approach captures the tail risk better than the non parametric one the variations of cross sectional returns.

Table 1. Univariate Cross Sectional Return Regression on Beta, VaR and CVaR for SBF250 stocks

Models	γ_0	γ_1	R^2
$r_{i,t} = \gamma_{0,t} + \gamma_{1,t}\beta_{i,t-1} + \varepsilon_t$	0,531*** (3,548)	0,182 (1,157)	3,6%

This table presents the time-series averages of the slope coefficients obtained from the 5803 daily Fama-MacBeth (1973) regressions for SBF250 stocks. The standard t-statistics given in parentheses are the Student-FamaMacBeth t-statistics. The average adjusted R² values are reported in the last column. ***, **, * denotessignificance level at least at the 1%, 5%, and 10% level, respectively. the averages of the slope coefficients are expressed in percentage

Recognizing the merits of estimation approach based on the CF expansion when returns are non-normal, we expect that VaR_CF and CVaR will be more appropriate than the other approaches to explain the variation of the left skewed and fat tailed returns in our sample. The results do not confirm this conjuncture; table 1 indicates that VaR and CVaR estimated using the CF expansion are statistically insignificant for the three confidence levels. This result contradicts the empirical findings of Ling and Park (2007) that the CF expansion is superior to the nonparametric method in estimating CVaR in hedge

fund industry. However, our result is aligned with the Rachev and Minick (2000) results explaining that estimation based on CF expansion could provide better results only in the case where returns are slightly far from normality which is not the case of our series of returns who present substantial kurtosis.

Another unexpected result arises from this first test; we find that the VaR explains more adequately the cross sectional returns than the CVaR. These results contradict the theoretical literature proving that the CVaR is more appropriate to characterize risk profile beyond the VaR which is more considerable when return distribution is leptokurtic.

A possible interpretation for these unexpected findings could be that extreme losses beyond the VaR have no informative power and do not play any role in explaining the variations of cross sectional returns. This means that investors on the French market are concerned by downside risk captured by VaR but they are not concerned about the extreme losses beyond VaR which are probably considered as infrequent returns (outliers) and do not integrate them in the asset pricing process. Subsequently the Conditional VaR could not have significant predictive power in explaining returns.

In a second stage of this section we examine the sensitivity of the results to recession periods over the study period. We exclude the recession periods such as the stock market crash of October 1987 in the last quarter of 1987, the downturns due to the deflation of dot-com bubble and the attempt of the 11th of September, 2001 spending from 01/01/2001 to 31/01/2002 and finally the global financial crisis in middle 2007 to 2009.

The aim of this analysis is to check whether the significance of the considered measures of VaR and CVaR is sensitive to the large negative moves of returns caused by the above mentioned recessions periods. Results are reported in table 2.

It is clear that none of the considered risk measure estimation is statistically significant. This result means that VaR and CVaR have a significant power in explaining the cross sectional returns only when returns strongly deviate from the normal distribution. This is confirmed by the test of normality of returns according to the modified sample data that indicates that the skewness of the returns distribution is nearer to zero and overall kurtosis is weaker than it was for the full sample period showing that the returns distribution is less asymmetric and more peaked. This result is in line with Post and Vliet (2004) argument indicating that there is a near-perfect relation between returns and downside risk measure during bad-states of the world.

Finally we conduct a multivariate regression considering jointly the traditional beta and VaR or CVaR. This enables us to test if downside risk measures are alternatives to the traditional beta or are complementary variables that are able to provide additional explanatory power. Results of multivariate regressions are reported in table 3. Panel A, B and C present results for the confidence level 1%, 5% and 10% respectively.

Table 3 indicates that beta becomes negative and remains insignificant and the additional risk measure turns out non-significant except for non-parametric VaR estimated with a confidence level 5% or 10%. We can see also that the global explanatory power of the models measured by adjusted R² is slightly improved. Consequently we can conclude that non parametric VaR is an alternative to traditional beta and not a complementary risk measure. Moreover, VaR remains to be a superior measure of risk on traditional risk measure and have significant predictive power for French market returns.

ROBUSTNESS CHECK: TEST OF S&P500 STOCK RETURN PREDICTABILITY USING VaR AND CVaR

For robustness purposes, we re-examine the performance of VaR and CVaR in explaining cross sectional returns using stocks from S&P500 index rather than the SBF250 stocks. The stocks screening is similar to that used in the previous section for the French market and it yields to 212 stocks. Given that a considerable change in the sample size could affect or even improve the quality of results in cross sectional results, we have to retain a sample size comparable to that retained in the analysis for SBF250 stocks. To do this, we select from the 212 stocks only 49 that have comparable characteristics (size, B/M

and skewness and kurtosis coefficients) to those of the retained SFB250 stocks. In fact, this selection enables us to control for the size and BM effects. In fact, there is voluminous literature documenting that size and B/M are determinant factors in describing asset returns.

Results from SP500 stocks (not reported here but available upon request) are considerably different than those on SBF 250. It seems that the results found in the first test are inherent to the French market. In fact, in this analysis, it is shown that CVaR is superior to VaR as a risk measure for the different confidence levels and different estimation approaches. We also provide evidence that the cross-sectional variation in expected returns of S&P 500 can be explained better when we take higher order moments into consideration when using the CF-expansion to estimate the VaR and CVaR. These results confirm the theoretical argument in the literature stipulating that CVaR is a coherent measure of risk while VaR is not

and those proving the superiority of non-parametric estimation of VaR and CVaR based on CF-expansion on the Normal approach in case of departure from normality. Our findings are in line with empirical studies of Bali, Gokcan, and Liang (2006) and Bali and Cakici (2004).

CONCLUSION:

Several studies have proved the superiority of downside risk measures compared to traditional ones in the apprehension of the return-risk trade-off. This paper focuses on VaR and CVaR as alternative risk measures to beta of the explanatory power of cross-sectional variations for the SBF250 stocks daily returns. This study contributes to the literature examining the importance of VaR and CVaR for asset pricing in case of non-normal returns by providing extensive evidence from the French Market. With notable exception of Bali and al. (2006) and Bali and al. (2004), little evidence has been provided so far for this market.

To estimate the VaR and CVaR, we use different approaches (parametric and non parametric) and retain three confidence levels (1%, 5%, 10%). The empirical results can be summarized as follows. First, we find that VaR and CVaR measures have a positive relation with returns for the considered confidence levels and seem to be superior measures of risk when they are compared to the traditional risk measure, the beta. Second, results from the comparison between the different approaches adopted to estimate VaR and CVaR are in contradiction with the theoretical literature implying the superiority of the approach based CF expansion on other approaches as it considers higher order moments when returns are non-normal. Moreover, we find that VaR captures better the tail risk than CVaR, which is another inconsistent result with the theoretical arguments. Further, we examine the effect of recession periods that have largely affected the French stock Market. We show that the explanatory power of the VaR and CVaR is inherent to the large moves due to these downturns periods.

Using multivariate regressions, we demonstrate that VaR and CVaR are not complementary risk measures to traditional beta but they could be better alternatives especially when normal approach is adopted for estimation of these measures. Finally, as a robustness test we re-examine the relation return-risk with the same risk measures using 50 S&P500 stocks. The results are considerably different and are rather in line with preceding studies.

We conclude that the French market reacts differently to extremes losses that losses beyond Value at risk are considered as infrequent events which have poor informative power in explaining the return variations and they are not integrated in asset pricing process.

AMERICAN HIGHER EDUCATION AT A CROSSROAD

Kooros Maskooki, Western New Mexico University
Kevin Maskooki, University of Minnesota –Twin Cities

ABSTRACT

In recent years, for-profit business models has been heralded by many policy makers as being inherently superior to non-profit models in providing appropriate guideline for managing public higher education. It is argued that if market oriented models can solve resource allocation and distribution problems in the for-profit businesses, they may just as well work for non-profit institution. This paper attempts to develop an analytical model for optimal resource allocation in higher education by taking into consideration the social costs and benefits (externalities) of producing education. It will argue that for-profit business models are inherently faulty to address resource allocation issues when externalities are present. Since higher education institutions create huge positive externalities, relying on private market blueprints generates incorrect information signals for resource allocation.

KEYWORDS: Non-profit, externalities, social costs

INTRODUCTION

The seeds of modern American higher education were originally planted during the 17th and 18th centuries. It was patterned after the British concept of the liberal arts education. Initially, U.S. colleges, like their British counterparts, were generally elitist church-sponsored private colleges. The mission of these institutions was to develop societal leaders who learned the art of living and leadership in order to run the country. These institutions provided a classical education for the wealthy elite of society. The elitist private colleges gradually became out of place. America needed entrepreneurs, a highly skilled labor force in medicine, nursing, engineering, farming, and crafts; the necessary ingredients, which the status quo educational system could not supply. With less than 1% of the U.S. population having access to higher education, the rest of the population was shut out of this opportunity. There was a dire need for a new educational system and an emergence of a new social paradigm. Hence, the land grant university concept was developed to “serve the society”.

Despite the public higher education’s enormous contributions to the welfare of the American society, the status of public higher education has become increasingly marginalized. There seems to be a national bewilderment regarding the role of higher education in America. Questions are raised regarding the essence and role of higher education in the United States: Does higher education serve the individual and societal needs and expectations? Should college curriculum concentrate on training students in marketable fields of study and drop programs in arts and classics? Should American higher education be accessible to all people or a select few? Interestingly, similar confusion about the mission and role of the university in the American culture existed in the 19th century that led to the creation of the land grant universities.

This paper attempts to develop an analytical model for optimal resource allocation in higher education by taking into consideration the social costs and benefits (externalities) of producing education. It will argue that for-profit business models are inherently faulty to address resource allocation issues when externalities are present. Since higher education institutions create huge positive externalities, relying on private market blueprints generates incorrect information signals.

DOWNSIZING IN IRAN: CULTURE VERSUS NECESSITY

S. Hadi Ahmadi; Zarif Polymer Co. Iran
Ruth McKay, Carleton University
Steven Murphy, Carleton University

ABSTRACT

This case follows the experience of an Iranian small business owner facing changing environmental forces. The most notable forces of change are the Iranian economy and policies, internal/external Iranian politics and global competition and relations. In order to save the organization the owner decides to downsize and decentralize aspects of managing the organization. These changes are initially unpopular and culturally sensitive. Eventually the owner succeeds with the changes and gains employee and management support.

In 1995, Haida* started working in XYZ Co. (XYZ), a small company that produced polymer based products. XYZ was established in Esfahan, Iran by Haida's father and uncle. When the company started, it produced and sold industrial products, but gradually it shifted into making medical products. At the same time Haida was taking Mechanical Engineering at university. After three years, Haida became the Procurement Manager at XYZ, and two or three years after that he became the company's CEO. The company expanded rapidly; opening an office in Tehran, and an inventory centre in Eslamshahr. By 2003, XYZ was exporting products many of which were the company's inventions. In 2004, XYZ became ISO 13485 certified, a globally recognized quality certification for medical products. Despite tremendous growth and market opportunities, the company started to encounter problems due to increasing global competition.

Running a company in Iran is challenging. There are external and internal forces that are constantly changing which affect the business environment. From the time Haida joined the company there were changes occurring. By 2000 these forces were having a significant influence on XYZ. The problems had been present for a while but the pace of the problems increased. The most notable of the forces of change were the Iranian economy, internal Iranian politics and policies and Iranian global relations such as its relations with China.

Haida is a person who needs to be continuously learning. He pushes himself, and, by association, the people around him, to question complacency and to solve problems. Running the company was demanding. He had lots of questions about managing an organization and was actively looking for solutions to these questions. Haida read books and magazines about business that helped. He did not know there was a university degree called an MBA. Then an acquaintance told him that because his undergraduate degree is in Mechanical Engineering, it is easy to go to a school of management for higher education and there is a degree called an MBA that would likely be of interest. Haida thought he could benefit from formal training in business for all his business positions. Haida was not just a manager of his company; he was also working with other companies as a board member or consultant. In 2007, after looking at several programs, Haida started an MBA in Iran, run by a foreign university. He chose a program located in Iran because of his need to supervise his business. In the program he found he was discussing many of the challenges his business faced operating in Iran. Such as product dumping, obtaining loans and dealing with double digit inflation.

*Name changed to maintain confidentiality.

CHINA AND IRAN: RULES ON DUMPING

Relations between Iran and China are very positive. The Iranian government supports the Chinese government because China often backs Iran in international politics such as dealing with sanctions from other countries. In the case of dumping, for example, if a company started dumping their products into Iran from Germany or Switzerland, the Iranian government would stop the company and put the name of that company on a blacklist. When companies from other countries, such as China (and Italy in the past), dump products into Iran, the Iranian government takes less notice and in some cases it takes no action at all.

Such dumping creates problems for Iranian manufacturers. For this reason, sometimes business connections between Iranian and Chinese companies are viewed negatively by domestic Iranian firm. For example, in 2009, XYZ wanted to import a specific detergent from Switzerland. The company was able to obtain a very good price for the detergent. When the company started to import, the Iranian government said that the price of the detergent was very cheap so they believed the Swiss company was dumping its product in Iran and therefore the product delivery should be stopped. But with Chinese companies XYZ finds the situation is different. It seems Chinese companies have a lot more freedom to sell cheap products into Iran. But in many situations companies like XYZ do not want to buy products from China, or at a minimum, they want a choice.

LOANS FOR IMPORTERS

Another reason Haida's company faced problems was the special government funding opportunities for importers. The government can help a business gain financing from foreign banks in the country of origin and provide a guarantee for the foreign banks. On the other hand, domestic manufacturers, when they want a large loan, find a loan very hard to obtain. It takes time. You have to develop relations with official party members of the Iranian government to obtain a large loan. This policy favours importers over domestic manufacturers.

INFLATION RATE

The Iranian government has difficulty managing inflation. The average annual inflation in Iran is around 15 to 20 per cent. At the same time the foreign currency rate of exchange is essentially constant. As a result, the cost of goods sold for Iranian manufacturers keeps going up. Meanwhile, for importers, with a near constant foreign currency exchange rate, the cost of goods sold does not change, making the cost of imports cheaper over time and the cost of domestically made products constantly increasing.

A CHANGE IS NEEDED IN XYZ

In April of 2008, Haida took an Organization Theory course as part of his Masters of Business Administration (MBA). In the course, the concept of downsizing was discussed. A video was shown featuring Robert Reich, who had been the U.S. Labor Secretary when Bill Clinton was president, and Al Dunlop, also known as "Chainsaw Al" who discussed the pros and cons of downsizing. The class also examined company reorganizations, which in some cases included downsizing.

When Haida returned to his company after the course, he had a meeting with his managers. It was the start of the Iranian New Year. The managers discussed a growing problem they had with the level of competition, particularly from importers. They were waiting for Haida to learn from his MBA about possible alternatives and solutions to help the company deal with the competition. Haida told them that during this course, he had learned how to downsize a company, and explained a bit about what that meant and how it was done.

In 2008, the Iranian economy was hit with a pronounced rise in inflation, which was advantageous to importers but not domestic Iranian manufacturers. This was very serious for Haida's company. Company costs were increasing, but due to the pressure from imports XYZ could not charge more for its products or customers would move to the competition. The competition was manufacturing in countries where inflation was not a large problem and as a result they were not faced with rising costs like XYZ.

Haida and his managers concluded that they needed to decrease their costs by 15 percent or they would not be in the market much longer. Fifteen percent is a large amount to cut. This was the impact inflation was having on domestic manufacturers, but not importers. The managers told Haida we have no other choice but to stop manufacturing several of our key products. Haida responded, "No, there is another choice. I think the size of our company is not in line with our production level and our margins. We have to downsize our company." Haida's managers asked "What do you mean by downsizing?" He replied, "I don't know at the moment, but let me think about this and I will come back to you in one week." Haida also asked all of his managers to help him manage the downsizing. The meeting was the first time Haida used the term downsizing for his company. Over the week Haida thought a great deal about how downsizing could be applied to his company. The concept, first introduced in the Organizational Theory course, gradually evolved into a plan for Haida.

One week later Haida met with his managers to discuss downsizing. The meeting lasted five or six hours. It was the first of many such meetings. It was very intense and emotional. During this meeting the team discussed how they would complete the downsizing. Haida and his managers brainstormed. There was very deep organizational resistance and some managers in that room could not believe that they might be required to leave the company so they started to argue. They made comments like "No, you cannot save the company with this downsizing. Maybe it will buy you some time, but after that you will lose everything. Nobody can help you to make this work because nobody can do all these jobs." The second meeting was too long because many of the managers wanted to argue against the concept of downsizing. Because the meeting was so intense, the team took at least two breaks. The emotions in the meeting were running high.

THE COMPETITION

In Iran, there is a large public company called SUPA. Haida's company is able to compete with this company easily because XYZ has a greater focus on quality. Most of the products of XYZ company have around eighty percent of the Iranian manufactured market share. But this market share was being eroded by XYZ's international competitors, such as Chinese companies. For a buyer in a big city such as Tehran, Isfahan or Shiraz, the buyer can receive financial assistance from the Chinese company. They import the goods and after one year they are charged only five percent on the loan from the time they acquire the goods to the time they pay the loan off. For large buyers, this loan is a real incentive to purchase Chinese products.

XYZ has less than 30 percent of the market share for some of its products. For example, it took a while to create an interest in XYZ's disposable glasses, a product that was Haida's innovation. XYZ found markets in the industrial medical dental field. XYZ had 100 percent of the market originally, but now it has less than 30 percent after a Chinese company copied Haida's product. XYZ had about two and a half years where it reaped the benefit of Haida's innovation until a Chinese company brought a copy into the market. Haida first found out about the copy of his product from one of XYZ's representatives. The representative called Haida and said "You told me it is your innovation, but we have found a Chinese company in the market with the same product." Haida said "No, it's impossible." So the representative sent a pair of the replica glasses to Haida – He was really surprised. It was his innovation imported from

China. XYZ could not do anything about the issue of imitating and intellectual property protection. Such a legal battle would not be effective across borders.

PERCEIVED QUALITY OF IRANIAN PRODUCTS

One of the problems with selling Iranian-made products in Iran is the perception that the Iranian-made products are of poor quality. During the eight-year war between Iran and Iraq the Iranian government closed the market to foreign companies. You could not buy foreign products. That was about 28 years ago. During that time, the Iranian companies started to produce products to meet market demand, but the quality was very poor. After the markets were opened up again to foreign companies, the European, Japanese and Chinese, brought their products back into the market. The foreign products were less expensive and of better quality. This forced many Iranian companies with poor products out of the market. As a result of this past experience there is a belief that Iranian products are of low quality. And this belief has been transferred to the next generation of Iranians.

Also due to Iranian rules you cannot choose foreign names for a brand or a product. There are some Iranian words that sound like foreign words and Iranian companies believe that to attract customers, they should choose names with such words because the customer may think that they are under a foreign company license, and that the product is not Iranian. This is very negative identification. Iranian businesses must have exceptional products and service to compete in Iran.

DOWNSIZING MEANS LOST JOBS

The problem in Haida's company was not the products or the perception of the products, it was the productivity. It was a hard decision to downsize XYZ. Haida decided that with the intense competition he had to make a change or the company might fail. XYZ had one employee for each simple job. Haida saved sixty percent of the jobs by cutting forty percent of them. Making short-term sacrifices like this meant the company could stay in business and maintain jobs in the long run.

It is not a common practice for Iranian companies to reduce their workforces. As a result, an employer ends up with unnecessary employees. To start a company you only need a few employees. After one or two years, the new company might need a specialized employee in areas such as finances, research and development or purchasing. Lots of jobs are created like this in Iran - created according to need at the time, rather than an overall strategy. After 10 years the company has lots of people in charge of special functions, some of which are no longer needed. But in Iranian culture, employees are reluctant to take on new responsibilities so it is hard to change employees' responsibilities. This is particularly true of less skilled jobs. It is likely that an employee in charge of procurement would resist taking on added responsibilities such as inventory and purchasing.

Iranian companies face challenges due to cultural and salary expectations. In Iran, employers have to pay employees a minimum wage that covers daily expenses. This wage is supplemented with benefits that nearly equal wages, including extra costs (tax, insurance, holiday pay and a New Year gift). As a result employees are relatively comfortable. The minimum wage and benefits discourages employees from embracing a job change or promotion. Employees do not try to increase their work as they are generally satisfied. This impacts low-level jobs more than high-level jobs.

Another challenge for an employer is the government emphasis on maintaining jobs. When you want to downsize and you want to lay off more than two or three employees you have to mount a very good case for your actions. The Iranian rules appear to Haida to support employees at the expense of the employer.

Another issue is how reducing a company's workforce impacts government funding. Most business owners close their company rather than downsize it because of the power the government exerts on them. It is a dilemma for the government and employers. Ultimately, the government does not want to see jobs cut. If a business owner wants to be more competitive and upgrade their company in such ways as introducing automation into their manufacturing – the government responds by withholding bank funding and asks why the company is firing someone if it is in such a good financial situation that the company can expand. As a result, the government may take the position that if a company lays off employees, it will not extend financing for the company's expansion plans.

When all of these impediments are put together (employees reluctant to assume new responsibilities, government support of employees over employers, and the impact of downsizing on the availability of funds) you can see that it is hard to downsize. As a result, most people decide to close their company rather than downsize. But closing a company is not the end of the story for a business. For most businesses, the products that companies are manufacturing are available in India, Europe or China. Businesses may have to stop manufacturing but they still have market opportunities. If a product has a good name in the Iranian market one can shift to importing the product since in many cases importing is less expensive than manufacturing. As a result, many companies close their business and open a new business importing the same product that they were manufacturing. In most cases this becomes an easier option than downsizing. Haida would not have thought of downsizing if he had not studied it in an MBA class. Haida was also thinking of closing production and importing, but was more interested in the downsizing alternative. Importing would not have solved all XYZ's problems.

PRODUCTIVITY IN IRAN

A central problem regarding productivity in Iran is the minimum wage. If you hire somebody, you have to pay minimum wage so pay depends on the hours worked not the employee's performance. The Iranian government has a strong protectionist approach regarding employment and jobs. Employees do not have to work towards improvement or any performance measures to keep their job. This aspect of minimum wage is very difficult for hiring and motivating employees. It can make workers lazy. To complicate matters, if a worker tries hard, other workers may stop him or her. They will say "What are you doing? Because of how you are behaving tomorrow the employer will want us also to work hard." So if somebody really wants to work hard, they can be stopped.

All these changes in work ethic have come about recently. For example, 100 years ago in Iranian traditional neighborhoods, Iranian workers did the building. But now-a-days less skilled building and construction workers come from Afghanistan. They are illegally working in Iran. The police arrest them, sometimes beat them and force them to return to Afghanistan. Afghani workers will work hard for less than minimum wage. A profound change in worker attitudes has occurred during the last 40 years. Over this time, government rules changed Iranian work culture. Employees are generally less willing to work hard and they do not feel motivated given the comfortable living at a minimum wage. This impacts productivity.

However, slowly, over the last couple of years, this culture of complacency is changing for those paid minimum wage. The economy has changed. Workers know that if they lose their job it is very hard for them to find another job in this economy. Factories are closing one by one. Because of the threat of losing their jobs, workers are starting to shift their attitude and work harder. This changing condition has made it easier for XYZ to entice workers to low-level jobs to change their ways and expectations, but there is still some resistance, especially from workers who have not had to face a job search in the current economy.

INFLUENCE OF THE CAPITAL MARKETS AUTHORITY'S CORPORATE GOVERNANCE GUIDELINES ON FINANCIAL PERFORMANCE OF LISTED AND UNLISTED COMMERCIAL BANKS IN KENYA

Charles M. Rambo, University of Nairobi

ABSTRACT

Good corporate governance is indispensable for the survival and performance of corporate entities. The Capital Markets Authority's (CMA) Guidelines on good corporate governance were developed purposely to improve governance practices in the corporate sector, as well as attract and retain investors for sustained economic growth. This study was inspired by an increasing trend of commercial banks being placed under receivership in the past five years, despite the existence of CMA Guidelines. Primary data was sourced from 16 commercial banks, 7 of which were listed at the Nairobi Stock Exchange (NSE). The results show that listed and unlisted commercial banks were significantly different in terms of board size, proportion of executive and non-executive directors, gender composition, cost of board maintenance, composition of audit committees, frequency of financial disclosures and more importantly, financial performance. The study emphasizes the need for a legal framework to enforce alignment with CMA Guidelines to safeguard members of the public from losing their savings and also ensure stability of the financial sector to enable the country attain targeted economic growth at 10% per annum.

BACKGROUND OF THE STUDY

Good corporate governance has become a subject of global interest because corporate entities play a vital role in promoting economic development through employment, wealth creation, as well as goods and services that provide solutions to emerging challenges. Besides, good corporate governance is a prerequisite for effective financial performance and greater autonomy (Matama, 2008; Colpan, Yoshikawa, Hikino and Miyoshi, 2007; Akodo & Moya, 2005; Sanda, Mikailu and Garba, 2005).

In 2002, the Capital Markets Authority (CMA) developed a set of Guidelines on corporate governance to guide public listed companies in Kenya in streamlining their corporate governance practices. The Guidelines were formulated in accordance with the provisions of sections 11(3) (v) and 12 of the Capital Markets Act (Cap. 485A). The Guidelines were also developed in response to the growing importance of corporate governance in promoting the growth of domestic and regional capital markets through better financial performance, capital formation and maximisation of shareholders' value (CMA, 2002; Matama, 2008).

The concept of corporate governance has been defined in different ways by various management scholars. For instance, Fourier (2006) notes that corporate governance is the trend towards greater responsibility in managing corporate entities and the conduct of business within acceptable ethical standards. Abu-Tapanje (2005) explains that corporate governance promotes fair, efficient and transparent management of institutions to meet well-defined objectives through effective practices and structures. According to the CMA Guidelines, corporate governance is the process of managing business affairs of an institution to achieve financial prosperity, accountability and improve shareholders' long-term value (CMA, 2002).

The overall objective of the CMA Guidelines is to strengthen corporate governance practices among listed companies in Kenya. In this regard, the directors of such institutions are expected to comply with good corporate governance practices, as part of their obligations to sustain their listing at the Nairobi

Stock Exchange (NSE) market. The Guidelines outline various corporate governance principles, touching on structure and functions of the board of directors; the rights and responsibilities of shareholders; auditing and accountability, as well as public disclosure.

Corporate governance and financial performance

Good corporate governance can attain better financial performance of both private and public institutions. According to Matama (2008), financial performance has several dimensions, including capital adequacy, asset quality, returns on capital and share price among other parameters. Capital adequacy determines how well financial institutions can cope with shocks to their balance sheets. In commercial banks, capital adequacy is measured in relation to the relative risk weights assigned to the different category of assets held both on and off the balance sheet items (Fourier, 2006; Matama, 2008).

Asset quality is an indicator of solvency. Financial institutions are usually at risk of solvency when their assets become impaired, so it is important to monitor indicators of the quality of their assets in terms of overexposure to specific risks such as non-performing loans (Fourier, 2006). Credit risk arises when a borrower defaults on loan repayment agreement. A financial institution whose borrowers default on their repayments may face cash flow problems, which eventually affect its liquidity position and bears negative impacts on profitability (Matama, 2008).

Financial performance can also be gauged through returns on capital. In this regard, Matama (2008) argues that the continued viability of a bank depends on its ability to earn adequate returns on its capital. High returns on capital may enable a bank to fund its expansion, remain competitive in the market and replenish its capital. As noted by Abu-Tapanje (2005), a high financial performance in terms of returns on capital also ensures that shareholders reap higher dividends on their shares. Hence, high share prices reflect the level of returns on capital for a financial institution (Abu-Tapanje, 2005; Matama, 2008).

Various studies have linked corporate governance to financial performance of corporate entities. These include Matama (2008); Colpan, et al. (2007); Fourier (2006); Akodo and Moya (2005); Sanda, et al. (2005); Abu-Tapanje (2005), as well as Klapper and Love (2002), among others.

This study determined the influence of corporate governance on the financial performance of listed and unlisted commercial banks. While listed commercial banks are under obligation to comply with CMA Guidelines, unlisted banks are merely requested to practice good corporate governance (CMA, 2002). These two scenarios have the potential to influence financial results of listed and unlisted banks over a period of time. The study focused on three pillars of corporate governance, namely board structure and functions, auditing and accountability, as well as transparency and disclosure. Financial performance was gauged in terms of net returns on capital in the immediate financial year. As noted by Colpan, et al. (2007), net returns on capital is an appropriate measure of financial performance because it is applicable to both listed and unlisted organisations.

Statement of the problem

The CMA Guidelines were developed to enhance sound economic growth through higher financial performance, capital formation and maximisation of shareholders' long-term value (CMA, 2002). All listed corporate entities in Kenya are expected to embrace good corporate governance practices in line with provisions of the Guidelines, as a pre-requisite for their continued listing at the NSE. However, unlisted firms are encouraged to practice good corporate governance (CMA, 2002). This implies that listed and unlisted institutions in Kenya are operating under different governance policy environments, which is likely to create variation in their financial performance.

Nevertheless, no academic initiative has comprehensively assessed and documented the variation in financial performance of listed and unlisted commercial banks. The few most recent studies focusing on the application of CMA Guidelines targeted the manufacturing and utility industries (Mutuku, 2005; Kiplangat, 2005; Gitari, 2005). This study examined the listed and unlisted commercial banks in terms of selected indicators of good corporate governance, including board size, proportion of non-executive directors, board maintenance cost and gender composition of the board. Additional indicators included the proportion of non-executive directors as well as the number of public disclosures in the immediate financial year. Besides, the study determined the influence of each indicator of good corporate governance on the financial performance of commercial banks.

Significance of the study

Developing economies need good corporate governance practices to build resilient banking systems that would survive in an increasingly open business environment (Kaheeru, 2001). Commercial banks play a crucial role in channeling citizens' savings into investments and providing necessary credits to the private sector. Hence, the stability and sustained growth of an economy is closely linked to the stability of its banking system (Matama, 2008).

Good corporate governance is an indispensable pre-requisite for the survival and high performance of corporate entities. In developing countries, corporate governance is particularly crucial in establishing the foundation for sustainable economic development (Matama, 2008). The CMA Guidelines therefore, aims at improving the capital market in the country, with a view to attracting and retaining investors to achieve economic growth.

The information yielded by this study is likely to stimulate policy debate on the need for both public and private institutions to comply with CMA Guidelines to enhance their contribution to the national economy. In addition, the information improves existing literature on corporate governance and financial performance of corporate entities; thus, making the output a valuable resource material for business administration and management scholars.

DATA AND METHODOLOGY

Using the cross-sectional design, primary data was sourced from 16 commercial banks; 7 (43.8%) of which were listed at the NSE, while 9 (56.2%) were not listed. The data was collected between May and July 2010. The information was obtained from senior managers after approval by their respective boards of directors. The sampling frame was stratified to ensure the inclusion of both local and international banks. However, based on the pre-study agreement with the banking institutions, their names remain confidential.

Quantitative analysis was performed at the bivariate and multivariate levels. In bivariate analysis, one-way Analysis of Variance (ANOVA) was performed to determine the statistical significance of variation between listed and unlisted commercial banks in terms of board size, proportion of non-executive directors, board maintenance cost and gender composition of the board; proportion of non-executive directors as well as the number of public disclosures. Bivariate analysis also yielded Pearson's Correlation Co-efficient, denoted by letter r . This statistic is often used to measure the degree of correlation between interval-scaled variables. Its value lies between -1 and 1. When $r = -1$ or 1, then the correlation between two variables is perfect. The larger the absolute value of r the stronger the degree of correlation between the two variables.

In multivariate analysis, multiple regression model was applied to determine the influence of each indicator of good corporate governance on net returns on capital, while considering intermediate variables

such as the number of account holders and bad debt portfolio. In general form, multiple regression models are based on the premise that Y is a function of a set of k independent variables (X_1, X_2, \dots, X_k) in a population (Bryman & Cramer, 1997).

$$Y_j = \beta_0 + \beta_1 X_{1j} + \beta_2 X_{2j} + \dots + \beta_k X_{kj} + E_j$$

Where: β_0 - the intercept; $\beta_1 \dots \beta_k$ - partial regression co-efficients; E_j - error term; Y_j - dependent variable; $X_1 \dots X_k$ - independent variables

In this study, the dependent variable (Y_j) is net returns on capital, while the independent variables ($X_1 \dots X_k$) included board size, number of non-executive directors, cost of maintaining the board, number of female directors in the board, proportion of non-executive directors in the audit committee, and the number of public disclosures. Both bivariate and multivariate analyses were facilitated by the Statistical Package for Social Sciences (SPSS) software package. The following publications detail information on the research design, approaches and methods used in this study (Nachmias & Nachmias, 1996; Bryman & Cramer 1997; Mwanje, 2001).

STUDY FINDINGS

This section has been organized into two parts. The first part determines the variation between listed and unlisted commercial banks in terms of key indicators of corporate governance. The second part examines and determines the influence of corporate governance factors on the financial performance of commercial banks.

Attributes of listed and unlisted commercial banks

The corporate governance attributes, which were of interest to this study included board size, proportion of non-executive directors, board maintenance cost and gender composition of the board; proportion of non-executive directors as well as the number of public disclosures. These elements were clustered into two broad groups, as indicated in the following sub-sections.

Board size, composition and maintenance

Board size refers to the total number of directors who served in the boards of commercial banks in the immediate financial year. According to the CMA Guidelines, board size should neither be too large to undermine deliberations and costly to maintain; nor should it be too small to compromise effectiveness in terms of skills and expertise. In this regard, the Guidelines suggest a board size ranging between 7 and 11 members. In this regard, table 3a below presents bivariate analysis results and table 3b provides a summary of the one-way ANOVA results.

Table 3a: Board size, composition and maintenance

		N	Mean	Std. Deviation	Std. Error	Min	Max
Number of board members	Listed	7	8.71	1.380	.522	7	11
	Unlisted	9	11.89	1.764	.588	9	15
	Total	16	10.50	2.251	.563	7	15
Number of non-executive directors	Listed	7	5.29	1.604	.606	3	8
	Unlisted	9	3.00	1.936	.645	1	7
	Total	16	4.00	2.098	.524	1	8
Number of female directors	Listed	7	2.43	1.397	.528	0	4
	Unlisted	9	1.22	1.202	.401	0	3
	Total	16	1.75	1.390	.348	0	4
Cost of board maintenance (million KES)	Listed	7	52.00	44.423	24.587	24	85
	Unlisted	9	126.78	77.298	29.099	91	360
	Total	16	85.31	34.410	53.603	24	360

Table 3b: Summary of ANOVA results

		Sum of Squares	df	Mean Square	F	Sig.
Number of board members	Between Groups	39.683	1	39.683	15.297	.002*
	Within Groups	36.317	14	2.594

	Within Groups	376625.556	14	26901.825		
	Total	1677455.438	15			

*, ** and *** => significant at 0.01, 0.05 and 0.1 error margins respectively

The results in table 3a shows that listed banks had an average of 8.7 directors in their boards, while unlisted banks reported an average of 11.9 directors. As indicated in table 3b, the analysis of variance obtained a calculated F-statistic of 15.297, which was significant at 0.01 error margin. This suggests up to 99% chance that listed and unlisted commercial banks were significantly different in terms of board size.

The CMA Guidelines encourages a balance between the executive and non-executive directors. This provision is based on the premise that non-executive directors provide a useful check to the activities of executive directors. A strong composition of non-executive directors ensures that executive directors act within set guidelines and ensures that the latter group is held accountable for their actions.

The Guidelines specifies that non-executive directors should form at least one-third of the boards of companies. The results in table 3a shows that listed banks had an average of 5.3 non-executive directors, while the unlisted banks reported an average of 3 such people. The ANOVA obtained a calculated F-statistic of 6.340, which is significant within 0.05 error margin. This implies a probability of up to 95% that listed and unlisted commercial banks were significantly different in terms of the number of non-executive directors.

The CMA Guidelines is advocates for the engendering of boards of directors of corporate entities. Better still, effective boards should reflect the structure of shareholders in terms of gender composition. Hence, women should form at least one-third of the boards of directors, as a sign of good corporate governance practice. The findings presented in table 3a above shows that listed banks had an average of 2.4 women directors, while unlisted banks reported an average of 1 woman director. Although, the results reveal a significant difference in women's involvement in the boards of listed and unlisted commercial banks, it is

important to note that no group of banks had attained the one-third minimum threshold advocated for by the CMA Guidelines. Furthermore, the ANOVA results in table 3b listed and unlisted banks were significantly different in terms of the number of women directors.

The cost of board maintenance is another critical indicator of good corporate governance that the Guidelines talk about. The variable refers to the total amount of financial resources used to maintain the board of directors in the immediate financial year, in terms of allowances. Sustaining a board of directors can be overwhelming, especially in situations where an institution has low returns on capital. The cost of board maintenance is directly correlated with board size and can have serious implications on net returns on capital, particularly where such boards are inefficient in decisions, strategies and resource utilization.

The results summarized in table 3a above shows that listed banks spent an average of KES 52,000,000 on board maintenance costs, while unlisted banks reported an average of KES 126,000,000. These results show that unlisted banks spent about twice as much as listed banks in maintaining the activities of their respective boards of directors. Table 3b shows that the analysis obtained a calculated F-statistic of 48.355, which was significant at 0.01 error margin. This implies up to 99% chance that listed and unlisted banks were significantly different in terms expenditure level on board maintenance.

Accountability and transparency

The number of non-executive directors as a ratio of the total directors, who served in the audit committee in the immediate financial year is one of the factors likely to influence the level of financial transparency in corporate governance. The CMA Guidelines indicate that audit committees should consist of at least three non-executive directors, which is crucial in enhancing transparency and ensuring that excesses of executive directors are checked. In this regard, table 3c shows that listed banks reported an average of 1.8 non-executive directors in the audit committees, while unlisted banks had an average of less than 1 such directors. In table 3d, the analysis obtained a calculated F-statistic of 8.429, which was significant at 0.05 error margin. This shows that the two sets of banks were significantly different in terms of the inclusion of non-executive directors in their respective audit committees.

Table 3c: Accountability and transparency indicators

		N	Mean	Std. Deviation	Std. Error	Min	Max
Number of non-executive directors in the audit committee	Listed	7	1.86	1.069	.404	0	3
	Unlisted	9	.56	.726	.242	0	2
	Total	16	1.12	1.088	.272	0	3
Number of public disclosures	Listed	7	2.71	1.113	.421	1	4
	Unlisted	9	.44	.527	.176	0	1
	Total	16	1.44	1.413	.353	0	4

The disclosure of financial reports to stakeholders and shareholders is a critical element of good corporate governance, as outlined under section 2.5 (2.5.1) of the CMA guidelines. Good corporate governance would be achieved with regular disclosures to stakeholders and shareholders to expedite corrective measures for negative issues affective financial performance.

Table 3c indicates that listed banks had done an average of 2.7 public disclosures of their financial reports arising from continuous monitoring and evaluation activities, while the unlisted banks had disclosed their financial reports fewer than once over the preceding financial year. Further analysis results contained in table 3d suggests a probability of up to 99% that listed and unlisted banks were significantly different in terms of the frequency of disclosure of their financial reports.

Table 3d: Summary of ANOVA results

		Sum of Squares	df	Mean Square	F	Sig.
Number of non-executive directors in the audit committee	Between Groups	6.671	1	6.671	8.429	.012**
	Within Groups	11.079	14	.791		
	Total	17.750	15			
Number of public disclosures	Between Groups	20.287	1	20.287	29.429	.000*
	Within Groups	9.651	14	.689		
	Total	29.938	15			

*, ** and *** => significant at 0.01, 0.05 and 0.1 error margins respectively

Financial performance

Financial performance was measured in terms of net returns on capital during the immediate financial year. 'Net returns on capital' refers to net income after taxation for both listed and unlisted commercial banks. Table 3e presents the descriptive statistics regarding net returns on capital, where it may be noted that listed banks recorded an average of KES 421,000,000 net returns on capital, while unlisted banks reported an average of KES 319,000,000.

Table 3e: Net returns on capital

		N	Mean	Std. Deviation	Std. Error	Min	Max
Net returns on capital (million KES)	Listed	7	421.14	86.713	32.774	344	591
	Unlisted	9	319.00	80.759	26.920	135	497
	Total	16	307.44	131.196	32.799	135	591

Table 3f: Summary of ANOVA results

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	160893.080	1	160893.080	23.152	.006*
Within Groups	97290.857	14	6949.347		
Total	258183.938	15			

*, ** and *** => significant at 0.01, 0.05 and 0.1 error margins respectively

Using one-way ANOVA to compare the means, the analysis obtained a calculated F-statistic of 23.152, which is significant at 0.01 error margin. Consequently, listed and unlisted banking institutions were significantly different in terms of net returns on capital.

Factors influencing the financial performance of banks

Using Pearson's Correlation Coefficient r, each corporate governance factors of interest to this study were correlated with net returns on capital to determine financial performance. The value of r lies between -1 and 1. When r = -1 or 1, then the correlation between two variables is perfect. The larger the absolute value of r the stronger the degree of correlation between the two variables.

Table 3g: Summary of Pearson's Correlation Co-efficient results

Factor	Calculated r	n	Sig.
No. of board members	-0.505	16	0.046**
No. of non-executive directors	0.588	16	0.017**
No. of female directors	0.706	16	0.002*
Cost of board maintenance	-.429	16	0.179
No. of non-executive directors in audit committee	0.491	16	0.053***
Frequency of disclosure	0.665	16	0.013**

*, ** and *** => significant at 0.01, 0.05 and 0.1 error margins respectively

The results in table 3g show that all the corporate governance factors were significantly correlated with the financial performance of commercial banks, except the cost of board maintenance. Besides, variables such as the number of board members and cost of board maintenance were negatively correlated with net returns on capital. The corporate governance factors included in the multiple regression analysis included board size, number of non-executive directors, proportion of female directors, cost of board maintenance, number of non-executive directors in the audit committee and frequency of public disclosures. The summary of regression results are presented in table 3h below.

The strength and direction of influence of each factor is indicated by the partial regression co-efficients (β). Whereas the direction of influence is indicated by the sign before β , the strength is signified by the value of the regression co-efficients. Based on this understanding, the results show that gender composition of the boards had the strongest positive influence on the financial performance of commercial banks. Consequently, increasing the number of female directors in the boards would cause a proportionate improvement in financial performance of the banks. The influence of this factor is significant at 0.01 error margin.

Table 3h: Summary of the regression analysis

	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	112.455	228.716		.492	.035**
Number of board members	-5.130	22.265	-.642	-.236	.015**
Number of non-executive directors	10.632	16.914	.170	.629	.011**
Number of female directors	49.714	26.680	.527	1.863	.000*
Cost of board maintenance	-.014	.149	-.036	-.094	.287
Number of non-executive directors in the audit committee	1.873	41.420	.016	.045	.135
Number of public disclosures	36.488	38.958	.393	.937	.003*

*, ** and *** => significant at 0.01, 0.05 and 0.1 error margins respectively

The number of public disclosures of financial reports also had a strong positive influence on the financial performance of commercial banks. The results further show that the influence of this factor is significant at 0.01 error margin. Public disclosure is a critical element of transparency and has positive effects on the level of trust and confidence among stakeholders, including clients and shareholders. In turn, the level of trust and confidence bestowed on a banking institution is an indispensable for its natural marking and expansion of the business horizon.

Another variable with a strong positive influence on the financial performance of commercial banks is the board composition in terms of executive and non-executive directors. The influence of this factor is significant at 0.05 error margin. The kind of check provided by non-executive directors against the excesses of executive directors is likely to enhance accountability and trust in the eyes of stakeholders. This is likely to have a positive influence on the financial performance. In view of this, increasing the proportion of non-executive directors in the board is likely to cause a proportionate improvement in financial performance.

The number of non-executive directors in the audit committee also returned a positive influence on the financial performance of commercial banks. However, its influence of this factor is not significant at any point within the 0.01 error margin. This suggests the number of non-executive directors on net returns on capital was insignificant, at least with the sample of banks involved in this study.

The results in table 3h further show that the number of board members had a strong negative influence on the financial performance of commercial banks. This suggests that increasing the board size would result

to a proportionate decrease in net returns on capital and vice versa. The influence of this variable is significant at 0.05 error margin. The influence of this variable is significant at 0.05 error margin.

The cost of board maintenance returned a weak negative influence on the net returns on capital; suggesting that increasing the cost of maintaining the board is likely to cause a proportionate decline in net returns on capital. However, the influence of this variable is not significant at any point within the 0.1 error margin.

The explanatory power of the model is indicated by the coefficient of determination (R^2). However, R^2 is often adjusted for the number of independent variables included in the model. This obtained an R^2 of 0.687, suggesting that the model was able to explain up to 68.7% of variance in the net returns on capital for the commercial banks involved in the study. However, when this is adjusted to take care of the independent variables used in the study, the adjusted R^2 reduced to 0.478, which means the adjusted model explained up to 47.8% of variance in the net returns of commercial banks. The associated analysis of variance obtained a calculated F statistic of 3.293 and a p-value of 0.053, which shows that the model was significant at 0.1 error margin.

SUMMARY OF FINDINGS AND POLICY IMPLICATIONS

The overarching objective of the study was to determine the influence of CMA's Guidelines on good corporate governance on the financial performance of commercial banks. To bring out the value of the Guidelines more effectively, the study covered a set of commercial banks listed at the NSE and another set of unlisted banks. Whereas listed banks have no choice about aligning their governance structures and operations with CMA guidelines, unlisted banks have no such obligation. This creates two different policy environments, which have the potential to shape the performance of commercial banks in the two scenarios.

Bivariate analysis results indicate that commercial banks operating in the two settings were significantly different in terms of key governance indicators, including board size, proportion of executive and non-executive directors, gender composition, cost of board maintenance, composition of audit committees and the frequency of financial disclosures. Although the findings suggest that listed commercial banks were adhering to the CMA Guidelines more than unlisted banks, some indicators such as gender composition and composition of audit committees suggest that neither group had attained the minimum threshold prescribed by the Guidelines. Nonetheless, the results indicate that listed banks recorded better financial performance than those unlisted, an achievement that was largely attributed to conformity and alignment with the Guidelines. Consequently, the value of the CMA Guidelines on good corporate governance cannot be over-emphasized for the stability and sustained growth of the financial sector in the country.

The national economic development blueprints such as the Vision 2030, have documented the national desire to achieve an economic growth rate of at least 10% per annum by the year 2020. The blueprints also articulate the strategies through which a sustained growth rate of the national economy shall be achieved, which include good corporate governance. There is no doubt that the corporate sector has a crucial role to play in Kenya's quest for a sustained economic growth as envisaged in the blueprints. The financial institutions are particularly very instrumental in mobilizing savings and financing investments. The stability of the financial sector is therefore, of great importance to economic stability and growth at the national level. However, how well the corporate sector fulfils its expectation largely depends on the effectiveness and efficiency of governance structures. Whereas well-organized and streamlined governance can propel organizations to the greatest height of success, poor governance practices can bring down some of the world's mightiest corporate bodies.

The financial sector is particularly very sensitive to poor governance. In the past, a number of commercial banks such as Trust Bank Ltd, Daima Bank Ltd and Trans-National Bank Ltd, just to mention but a few, have collapsed and sunk with millions of Shillings with which they were entrusted. Forensic analysis of the collapse of such commercial banks reveals serious issues, which could have been avoided through good corporate governance practices. It is therefore, important that the Government of Kenya should enact a legal framework to enforce alignment with CMA Guidelines on good corporate governance, especially by corporate entities entrusted with financial resources belonging to members of the public. Such a move will not only safeguard members of the public from losing their savings, but also and more importantly, ensure stability of the financial sector to enable the country attain the targeted economic growth at 10% per annum.

CAN SERVICES CHANGE AN EVERCHANGING ECONOMY

Danciu Lucian Alexandru, Lucian Blaga University-Romania

ABSTRACT

The current paper addresses and tries to argue why services are the hope for an economy gone wrong to recover. It addresses several key points and arguments in order to build a case for services as the chance that economies the world over have to bounce back after the most devastating crisis of modern times. There are also several solutions being offered, as well as a final question, without an easy answer, a matter of trust in a system that betrayed its principles.

INTRODUCTION

In spite of the progress that our world has made over the last few decades, in spite of the advances in technology that we are now using, in spite of our progress overall, we found out that nothing really changes and that our world today is still as vulnerable to financial and economic crisis as it has always been.

It has been a rather sad confirmation of the fact that the economy is cyclical and that we will never be able to fully understand how a crisis works, let alone to control it. Economic theory only goes so far, and our limits of comprehension are shamed yet again, as we are unable or unwilling to do something concrete to counteract the cause of a crisis, not only the effects.

The current crisis has been official ever since the fall of Lehmann Brothers, in 2008. Since then, rivers of ink, thousands of internet pages, TV shows, online debates, more or less spirited, which showed more or less adequate or prepared people, specialists, economists, psychologists, talking about a crisis which makes more or less sense. Questions about the current crisis, because, in our opinion, we believe that it is still going as strong as ever, therefore, it is current, will continue to rise many years after it will be dead and buried.

The current paper wishes to address specific questions to whether or not services, as an important sector of the economy, and, in developed and developing countries, the most important sector in an economy, can constitute an engine of growth, more so than the other sectors of the economy, which have proven to be somewhat limited, due to their own nature. Can services help develop the world or have they indirectly lead to the current downfall?

GLOBALIZATION AND ITS RISKS

We can already notice that the world is in an advanced state of globalization. This is the current state of things, the current "status quo" and in our opinion, this will not change soon. In spite of the current financial crisis, in spite of all the negative things that can have happened and that are happening, the process can not be slowed down. Elements which have been set in motion can not be undone, as we shall see. Ergo, the current situation affects us all, and will do so for quite some time.

The banking system has so many flaws, that simply counting them could take a lifetime. However, although we believe that the system was the cause of what we are witnessing today, this is not an only cause. A disaster like the one that we are experiencing is simply not able to be produced by a single element. Therefore, we have to mention the fact that fault lies within us all, within governments which

allowed the financial institutions to grow in power and not protecting the interests of the common citizen. When dealing with major corporations, a simple citizen is often daunted and the institutions which should protect the citizen are simply not doing their job.

So, we can conclude that we, as simple human beings, have traded several things for others. Are we really free? Or are we slaves to a system designed to enslave? We now have hi-tech devices, countless credit cards, but how much closer are we to being free?

We all lavish in the benefits of globalization such as quasi-free communications, social media sites, the possibility to purchase anything online. What have we traded that for? Some argue that we traded our very souls. This is because states have continuously traded parts of their own sovereignty for financial concessions, for access to markets. The costs of such decisions, often made by corrupt politicians, are almost always paid by the population of such states.

Now, we face the other side of globalization. We face the dark side. We have to face the fact that countries from different areas in the world are increasingly dependent on each other. This means, in cases of crisis, that we have a "domino effect", meaning that the fall of a country has a direct effect on the countries that rely upon it. And because most economies in the world are unable to depend upon themselves to pay their outrageous levels of debt, there is only one option which they have to follow, namely to default on their debt.

This, however, does not mean that countries will have their debt erased, as some would believe, rather that the time span for paying such debts is being widened, to allow the economy to recover, and then pay its debts. Such deals, made by politicians, not economists, for tiny perks, have enslaved nations.

We must perceive the development of globalization as a desire from almost all the nations on the face of the earth. Too few have been the ones which have opposed it, quickly crushed by organisms such as the World Bank, the International Monetary Fund, or giant corporations, nameless in their quest to subdue those who oppose the globalization tide.

Of course, this point of view is considered rather disturbing for the common man, whose attitude towards economists and bankers in particular, is becoming one of discontent and even rage. Economic data is increasingly difficult to understand, and things such as CDS (credit default swaps), graphs are more and more difficult to explain. The most recent turn of such events is the evolution of movements such as the "Occupy Wall Street" movement, which is now on a global rising tide.

Coming back to the positive aspects of globalization, we must note, among other things, the development, without any precedent, of services. The current paper addresses the main three categories, namely the categories of tourism services, communication services and financial services. Their development, and of all subsequent services, for that matter, has been influenced by the fact that organisms such as the World Trade Organization continue to advocate for free trading and thus, a lowering of all the trade barriers, including barriers for services. Services have not only developed within a country, but have also extended themselves to other countries, as we shall see. Thus, international trade with services was born, having globalization as a prerequisite and developing itself on the wings of free trade, in spite of all the risks undertaken.

International trade in services

Of course, when we are talking about services, we are talking about very specific segment of global markets, a segment which, in the last 30 years in particular, has developed almost undaunted by restraint. We mention this because we have to take into account the fact that regulation concerning services are quite often much more drastic than those concerning goods and merchandise.

The specificity of services lies within their core characteristics. Namely, services are intangible, but we wish to point out another one of their characteristics for the sake of our argument. Namely, the impossibility of separating the provider of a service, from the consumer of such a service. This means that when a company that is a service provider wishes to extend its business over the borders of a nation, it has to take into account that it comes in direct contact with the consumers of its service within the country where they are locating their new investment.

This leads to another interesting element, namely the fact that reputation is paramount when talking about services. The providing of a service is difficult, particularly because the negative feedback from a consumer can damage the reputation of an entire company. Classic law suits can argue that affirmation.

Yet still, in spite of the current world crisis, the service sector has been at the core of its development. Only if we mention the financial services sector, which, until 2008, was the engine of development within the world, we find several interesting facts. Tourism and communications follow closely.

Key economic data from the year which has passed, published by the World Trade Organization (International Trade Statistics, 2010), reveal several interesting figures. Concerning services, as a whole, it is becoming clear that we have two major providers of services within the global economy. Namely, Europe and Asia. Other interesting data reveal that Europe's share of world exports of commercial services accounts for roughly 50% of the total exports, whereas Africa, for that matter, accounts for only 2,3 %.

Also, more than half of these services are noted, within the same publication (International Trade Statistics, 2010, pag. 1350 as other commercial services, including everything from financial services to sexual services – of course, in countries where such services are legal.

Thus we can observe the fantastic impact that services, as a whole, and financial services, in particular, have on the world. A world still in crisis, no doubt. A crisis brought forth by globalization, including services, although some would argue that it was greed, rather than the services themselves, which provided the outcome of things as it is today. But also, we believe, a crisis which the service sector must solve, and can solve.

The question remains

So, can the service sector, and the financial sector in particular, one guilty of many wrongdoings in the past, if we are to include frauds by people such as Bernard Madoff and Robert Stanford, become a saviour of the world economy? Our argument is yes.

This is not a full hearted "yes", rather, we are obliged to believe that this sector can truly pull us out of the deep recession. It may sound silly, even risky, but we believe that this is the only way. Of course people will be furious that, in spite of all the harm did by banks or faceless corporations, we must trust in them again. We should, however, consider the alternatives.

We are unprepared for another disaster, and the magnitude of the 2008-2011 crisis revealed only weaknesses, not only for the economic side, but also for politicians, which even now, squabble about, in stead of trying to prevent the fall of the euro, for example. We are also not willing to go through another disaster, such as the one we are just getting out of.

But there is absolutely no possible scenario in which we can exclude financial services, and thus, banks and financial institutions from our world. We would have no money, no credit, ergo, no crisis. But we would be back to trading such as we did during the beginning of man's history. And that is simply not an option.

We could think of another world financial system, with a completely different architecture, in which crises would be a thing of the past. True, if such a system would be possible. Economists the world over have shown that cycles are a normal thing within an economy. Everybody from Kondratieff to Keynes have agreed on the fact that whatever we do, cycles, namely periods of growth and downfalls, can not be avoided.

However, what we can do, is to apply the only theories that have proven to be somewhat successful in overcoming crisis periods: keynesian methods. Keynes correctly revealed that the state must act, through its means of action, to decrease booming growth, in periods of growth, which can lead to inflation and spark off crises, and as a fact of stimulus in periods of recession, easing the pressure on small and medium enterprises, and safeguard the financial sector.

This system has unfortunately not been selected in Bretton Woods, in 1944, where Keynes` system, built on its essential conditions, was not selected. In stead, people choose the financial system of Harry Dexter White, which has proven faulty not once, but several times. We are mentioning, as arguments, the oil shocks of the 70s, the Asian crisis of the 90s and the current world setback. Of course, this system was chosen then because of the American domination and eventual victory in the Second World War. History, then, as it is now, is written by the victorious.

Regardless, a new financial system is not doable simply because there is neither the political will, nor the patience from markets, governments, and, to some extent, even citizens, to take part in the painfull process of a new financial framework, which would lack credibility.

So, it would seem that the only choice that we have is to trust again. Forgiveness is something that most religions of the world can agree on. But is there place, time, for forgiveness in the business world? How can the thousands of suicides forgive the fact that because of banks, they have took their lives? How can we forgive corporate fatcats, which make a habit of robbing the poor for their own benefit? How can we forgive monster corporations which push their own dark and obscure agenda?

We can not. But it does not matter, because what we must do now is not forgive, rather, to think which are the best means for salvation. As far as we are concerned, the service sector provides the key. International statistics reveal this clearly.

Another upside to the problem is the fact that the financial system seems to, and this is generous, but seems to have recovered. According to the Economist, "many banks have barely recovered from the 2008-09 recession, so the prospect of slowing economic growth—and less stimulus from government this time round—has most on edge". Yet we must treat such affirmations with optimism. They got us into this mess, they can get us out.

We continue our argument with an important change in people perception: paying down their debta in stead of borrowing. According to the same source, "households in developed markets will focus on paying down debt instead of borrowing. Companies, flush with cash and fearing weak demand, will not provide much business for investment banks. New regulations on capital and liquidity will require banks to brave hostile markets to raise more than \$1trn in fresh funds over the next few years. Exposure to debt issued by sickly euro-area governments will arouse fear".

When banks and financial institutions issue credits, they create inflation. Right now, due to tighter regulation, a new fiscal treaty in place within the E.U., at least in theory, we should be relatively safe. Of course, there is always the danger of a "W shaped" crisis, but as we go on, the danger subsides. Loan

growth in America and Japan, the latter hit particularly hard by both the crisis and the devastating earthquake, will outpace inflation.

It is true that investment banks, a main engine of the financial sector, will be forced to hold more capital and reduce leverage, so they will not easily earn their cost of capital; pay cuts and job losses will be common within such institutions. The Economist notes that "hedge funds will have trouble justifying their steep fees as their performance in extreme market volatility—when they are supposed to shine—disappoints".

And still, in spite of all the uncertainty, things finally seem to be heading upward. The governments of states, corrupt in various degrees, must step in and hold speculators at bay. In spite of cases such as Greece or Ireland, even Romania, for that matter, everybody has learned a costly but valuable lesson. All this information and perspectives of the financial sector finally doing something right for a change, collaborated with the political will to recover from this debacle and with other areas of the service sector, which have proven to be much more stable than the financial sector, set the course for a recovery driven by services.

Agriculture and the industrial sector can help, but only to some extent. There are only so many tons of cereals that can grow on a acre of land. There are only so many cars that a manufacturer can produce. However, with services, the possibilities are unlimited. Their development is astounding, and it shows no sign of cooling down.

In the end, this is just a question of lesson learned or not. As history reveals, those who do not know it, shall repeat its mistakes. Hopefully, we can prevent that. And hopefully, services as a whole, including international trade with services, can set the basis of a new growth, much more stable, much more reliant, much healthier, for years to come.

THE INVESTMENT POLITICS AND THE DIVERSIFICATION OF FINANCING RESOURCES IN ROMANIA

Paul Lucian, Lucian Blaga University-Romania

ABSTRACT

Romania's priority is to maintain an high investment rate ,higher than the one of the EU member states, because these countries modernized their energetic, transport and public utility infrastructures, they developed their educational and the public health systems, they reduced the technological and informational differences, decades ago. Through the investment politics, Romania will continue to attract foreign investments, whose annual average was remarkable. For the financing of the investments, a diversification of the internal and external resources is necessary. The internal resources are based on the development of the saving instruments: the development of the market for transaction of state titles, public and corporative obligations, the settlement of the mortgage credit market; the stimulation of the public placement instruments, the fiscal instruments, the extension of the capital market, public-private partnership, initial public offers, a reduction in the usage of the public money. The external resources will also be diversified by using: European funds, credits from foreign funds, financial assistance from foreign governments, loans from the World Bank, the International Monetary Fund and the European Investment Bank. The purpose for any investment effort is the economic growth and development.

KEYWORDS: direct foreign investments, investment effort, financial resources, saving money instruments, substantial economic growth.

We consider that in the solving of the world's major problems, the investments play an important role. These are essential in the evolution of every economic system because, through them, the economic growth is regenerated, bettered and stimulated. The present and the specific needs of the economic development of Romania, that could help our country become an active, competitive and respected partner of the EU, need to involve, both actively and responsibly, the public institutions ,central or local, the private system, the professional associations, the social partners and the civic society, in the maintaining of a favourable environment for the investments of local and foreign capital, destined for the modernizing and the developing of the country. We need to underline the role of the investments destined for the productive economic activities because these stimulate the demand and the offer and create national riches.

For it to become compatible with the EU principles, norms, mechanisms and institutions, Romania is mainly concerned with a sustainable economic growth, with a promotion of a coherent investment politics and with the creation of a favourable business environment. The politics regarding the intensification of the investment process is one of the main priorities of the Romanian economic politics. The maintaining of an investment rate in Romania, which is than in the other EU member states, is necessary for the realization of a real convergence.

The modernization of the energetic, transport and public utilities infrastructures, the education and the public health systems, the rural development and the reduction of the technological and informational differences involve a great investment effort. While most of the EU members states faced the same problems decades ago, in Romania they presently represent essential priorities.

For the growth of the investment rate, for medium and long term, we need to continue the investment politics in order to attract direct foreign investments, especially those one that can substantially contribute to the growth of exports, so that this can become the main component of our economic development.

The main factors of the economic development are: the technological process, the scientific and the technological research, the innovations, the investments, the foreign trade, the population growth and others. We consider that, at the present development stage of Romania, the investments represent the most important factor that stimulates the economic growth, while the other factors are, at their turn, influenced by these investments. Any investment has as a purpose the realization of future advantages under the form of profit maximization and of riches growth. In the specialized literature, it is said that a sustainable economic growth is done through savings and investments.

In the present situation, that of a severe international financial crises, the strategic orientation of local and foreign investors supposes a good knowledge of the present and future social and economical environment and it demands identifying the causes of the permanently changing economical system in which these investors operate.

The restructuring of the national economy, the growth of the national production or the equilibration of the balance of foreign payments can be done through an ample investment politics and strategy, taking into consideration the economical, the social, the financial and the political impact, that these investments have. The public or the private investor puts into practice only those investment projects with huge chances of success, and which will generate beneficial effects for the entire life period of the project in question, adapting itself to the ever changing economic and social environment. This approach is important for the investments made in the field of the public urban equipment, where the major projects need to fit perfectly between the axis of the local and the regional strategies.

A priority for every Romanian government, regardless their political orientation, was the promotion of direct foreign investments for the establishing of an annual target, meant to align Romanian to the politics of the OECD countries. Because of this investment politics, that has been sustained all these past 4 years, 2004-2007, the evolution of the direct foreign investment politics with a annual average of 6.2 billion Euros, creates the premises for the its stabilization and , in the following years, to comparable levels , even under a huge absence of privatization by the attraction of Greenfield investments.

In order to sustain the present investment politics, the financing resources for the public investments and for the private ones, need a gradual growth of the internal saving rate from 15.3% in 2007 to over 20% in the following years, because of the reduction of the consume tendencies. Mainly, the financing resources can be internal and external.

As far as the internal financing resources are concerned, these are linked to the population possibility and will to save money. The factors that influence the saving rate are the GNP/citizen, the growing rate of their income and the income distribution. The will to save money depends on the existence of a developed monetary-financial market and of solid and reliable financial institutions. The economic theory shows that in a market economy, for net revenue, the saving rate is reflected by the reserve of the saving instruments, by the bank system credits, by the market interest and the degree of macro-economical stability.

The financial environment, which favours saving money, is an important factor for the mobilization of resources, for the creation of the necessary investment capital. The development of the saving instruments, bases for the successfully applied practices in the other EU member countries, can include:

- the development of a market that can freely make transactions of state titles, public and corporative obligations, long term placement instruments to which the population can also have access.

- a settlement of a mortgage credit market that can freely make transactions with the bank rights and guarantees;
 - the stimulation of the collective placement instruments, respectively of the supplementary pension funds and of life insurance , which can attract important sums of money through long term commitments;
 - the encouraging of the saving banks to extend their activity towards the rural environment.
- The internal financing can be done from the state budget, only if the budget investments are bigger while the budgetary deficit is smaller. Usually, the budgetary deficit is financed through the loan method or through the printing of money.

If the government gathers more money than it consumes, on goods and services, the budgetary surplus can be invested by the government in infrastructure, state enterprises, private companies, etc. The growth of the taxes under any form or the good collection of those taxes can not sufficiently help the growth of the budget for the financing of the investments.

On short term, the reduction of the taxes determines the increase of the budgetary deficit, because the number of those that are subject to taxation does not grow immediately. Because of the reduction of the tax level, the economic agencies keep a large part of their gained profit, so they will raise their revenues, the savings grow and in the same time the investments grow.

In order to increase the investment degree, Romania needs to adopt a tax reduction policy; also, it would be useful to examine the costs and the benefits of using the fiscal instruments for the realization of such politics by:

- the reduction and the annulment of the interest for the bank deposits of the population, because the maintaining of the present rate discourages the saving of money, the buying power of such deposits is, in many cases, smaller than at its beginning;
- the reduction of taxes on the reinvested profit in the purpose of stimulation of capital expenses for the growth of product and services competitiveness and for the diminishing of the present consumption generated by the spending of the money coming from the dividends.

Another source for financing investments can be realized by the extended use of the capital market. This can be done by the listing of the companies where the state still holds significative stock packages and trying to make things better in this area by attracting a considerable amount of capital in order to assure a supplementary financing for the great infrastructure projects and help them end earlier than intended.

By its investment politics, the state sustains the development of public, private partnership, that do not need to limit themselves only to concessions. Even though, these concessions need to be encouraged under the favourable economical and the financial conditions to sustain investments.

The financing of new companies, only partially capitalized by initial public offers, in which the state or the local authority holds the minor package by listing it to the stock market, this can constitute another solution to reduce the the initial budgetary effort and the expenses made on maintenance after being give for exploitation, in the case of infrastructure investments.

Other investment financing method is represented by the external resources. These are: the direct foreign investments, credits taken from foreign banks, financial assistance from foreign countries, long term loans from the World's Bank, short and medium term loans from the International Monetary Fund.

The direct foreign investments have beneficial effects on the development of the economy by: technology transfer, a better quality for the products given to the consumers, new income resources for the budget, a higher export capacity of the economy.

In the theory of the monopole advantage and in the theory of internalization, one can find the theoretical fundaments of the impact of the direct foreign investments on the receiving companies and on the companies that are fully dependable on local capital.

The new member states of the EU accept the idea of a positive impact of the foreign investments in the process of transition from a controlled economy to a market economy. The motivation for the flux of foreign investments is linked to the existence of some competitiveness and internalization advantages, which come from operating in an organizational structure and in a unique property.

Based on these advantages, the foreign companies overcome their difficulties of working in a foreign environment, having to deal with local competition and be profitable in the same time. In this context, by the investment politics, the Romanian state is interested and forced to create the conditions, to stimulate the foreign investors in the process of saving and investing money in the purpose of sustaining their own economy.

The second foreign financing category is the credits taken from the foreign banks. Generally, the economic agents take credits from foreign banks, money that is used for investments. The other forms of external capital, such as: financial assistance from foreign governments, long term investments from the World's Bank and short and medium term loans from the International Monetary Fund, are contracted by the state as investment resources which contribute to the economic growth or for economic crises.

The complete and effective use of the European funds allocated through the EU programs, can substantially contribute to the growth of the investment rate and to a deficit reduction, taking into consideration their PIB value of 2.5% in 2008 and of 3% that will be in 2010-2013, while the Romanian contribution to the community budget is reduced from 0.98% from the PIB in 2008 to 0.70% in 2013

MARKET ORIENTATION IN LOCAL GOVERNMENT: CREATING A MEASUREMENT FRAMEWORK BASED ON THE ANALYSIS OF MUNICIPAL WEBSITE CONTENT

Lucía Sáez Vegas, The University of the Basque Country.
Iñaki Perriñez Cañadillas, The University of the Basque Country.

ABSTRACT

Increased competition between cities requires them to adopt concepts and methods that have been used by the private sector, such as market orientation, strategic management, marketing, human resources management, competitive advantage or the definition of a competitive image and brand, etc. The aim of this study is to analyze the market orientation in Spain's regional capital cities by examining the content of their municipal websites. Local governments are increasingly represented on the Internet. The Internet enables them to combine elements of a town hall, tourist information bureau, chamber of commerce, business directory, shopping mall and local newsmagazine. This study also analyses whether, as a result of market orientation in management, the cities studied have fostered marketing strategies, such as the segmentation strategy, brand strategy, or city internationalisation, and it proposes a standard framework for measuring the city's market orientation by examining the content of the municipal website.

KEYWORDS: Market Orientation, Local Government, Websites, Competitive Advantages.

INTRODUCTION

One of the most important phenomenon in the late twentieth century was the globalization of the international economy. Faced with a global economy and as integration processes intensify, the role of cities and competition among them has become more significant. Cities face the challenge of being able not only to manage the resources at their disposal, but also to attract new resources, forcing local authorities to make decisions that optimize their intervention styles, in order to thus achieve greater competitiveness at the regional, national, and/or international levels.

This situation has forced cities to adopt business management principles, concepts and tools, such as market orientation, strategic planning, marketing, human resource management, the search for differentiation, definition of an adequate image, brand and positioning and, in short, a number of competitive advantages that allow them to meet the demands of all their target audiences and face the competition. In this vein, the adoption of market orientation is considered equivalent to developing a competitive advantage for the organization that is based on identifying, creating value and achieving customer satisfaction.

The presence of local governments on the Internet is growing and the advantages it offers as a marketing tool (Küster, 2002; Currás and Küster, 2005), such as accessibility to information, offering relevant information, complaints management, low cost and customer service, are considerable, although research on the role it plays in urban management has not been studied in depth (Sicilia and Pérez, 2007). In this study we propose a standard measurement framework to measure a city's market orientation through its municipal website content.

MARKET ORIENTATION IN MUNICIPAL MANAGEMENT

The implementation of the marketing philosophy and principles in cities requires market-driven planning, which involves an orientation in all actions towards the different target audiences, rather than towards service offerings, as in the past.

The analysis of market orientation at the municipal level can be conducted along the lines of Kohli and Jaworski's basic model (1990) of market orientation from a behavioural perspective. This model has also been applied in the field of local governments and its consequences on citizen participation has been analyzed (Cervera, 2004). According to this model, the core of this orientation in the profit and not-for-profit, private and public sectors rests on three pillars: *generation of information* from the market that makes it possible to understand their needs, *dissemination* of that information to share that understanding and lastly, *responsiveness* to the information in order to satisfy market needs.

EMPIRICAL ANALYSIS OF THE MARKET ORIENTATION IN MAJOR SPANISH CITIES ON THE BASIS OF THEIR MUNICIPAL WEBSITE CONTENT

The research conducted aims to analyze the market orientation of the capital cities of Spain's different regions. To achieve this, the content provided by each municipality's official website was used as a source. The use of the Internet and new information technologies in general as a marketing tool has been the object of numerous studies (Ju-Pak, 1999, Wilkie and Kollmann, 1998; Alet, 2001; Küster, 2002; Currás and Küster, 2005). However, from the field of marketing in urban management, research studies on the Internet's role as an environment for exchanging market information are not so numerous (Sicilia and Pérez, 2007). From this perspective, the dimensions offered by the websites as a marketing tool (Küster, 2002; Currás and Küster, 2005) are: accessibility, obtaining relevant information, handling complaints, cost advantages, and customer service.

RESEARCH METHODOLOGY

The methodology for collecting information on the cities under study is based on an analysis of content (Bigné, 1999) and its specific application to the analysis of websites (Dholakia and Rego, 1998; Rodriguez, 2002; Bellman *et al*, 2006). A total of 18 cities were analyzed: Madrid, Barcelona, Las Palmas de Gran Canaria, Tenerife, Pamplona, Santander, Santiago de Compostela, Valencia, Vitoria, Saragossa, Logroño, Toledo, Oviedo, Merida, Murcia, Valladolid, Seville and Palma de Majorca for Spain's 17 regions (Las Palmas de Gran Canaria and Santa Cruz de Tenerife share being the Canary capital), which represents 100% of the population under study.

Definition of study variables

This study analyzed 14 variables corresponding to the three dimensions of Kohli and Jaworski's market orientation model (1990), and also included as a variable to be analyzed the municipal budget for each city in question, to the extent that available financial resources may explain differences in behaviour between the cities.

RESULTS

The first analysis obtained Cluster 1, which is made up of the cities of Barcelona and Madrid. Cluster 2 is formed by the cities of Las Palmas de Gran Canaria, Murcia, Logroño, Santa Cruz de Tenerife, Santander, and Merida. Cluster 3 includes the cities of Oviedo, Toledo, Santiago de Compostela, Valencia and

Valladolid. Lastly, Cluster 4 is formed by the cities of Palma de Mallorca, Pamplona, Seville, Vitoria and Saragossa. The variance explained by the participation in the four clusters is 61.88%.

Table 1. Study variables

<p>Variables corresponding to the “Generation of information” dimension: n° of opinion polls conducted, n° of municipal networks to which the city belongs, Incidences, complaints and suggestions through the municipal website, n° of on-line surveys on services provided by the website, Citizen participation on the website.</p> <p>Variables corresponding to the “Dissemination of information” dimension: n° of municipal periodicals, n° of councils, n° of languages on the municipal websites, n° of languages on the tourism websites.</p> <p>Variables corresponding to the “Responsiveness to information” dimension: n° of segments in which the tourism website is divided, n° of plans underway including the strategic plan (SP), n° of segments into which the municipal website is divided, n° of social networks to which the municipality belongs, Public/Private collaboration between the municipality and the city’s main private stakeholders.</p>
<p><i>A total of 15 variables corresponding to the three dimensions of Kohli and Jaworski’s market orientation model (1990) were analysed. Also included as a variable to be analyzed was the municipal budget of each city under study. Source: in-house. Data processing: Dyane version 4.</i></p>

Based on the analysis of the content of the municipal websites of the cities analyzed, the Cluster 1, has the highest mean in the following variables: municipal budget, number of opinion polls conducted, number of on-line surveys, number of municipal periodicals, number of councils, implementation of plans and membership in social networks, giving equal weight to the three dimensions of Kohli and Jaworski’s behaviour model of market orientation (1990). Cluster 2, has the highest mean in the following variables: number of segments into which the tourism website is divided and public-private partnership between the municipality and the city’s main private stakeholders. Both of these variables belong to the Responsiveness to Information dimension in the behavioural model. The cities in Cluster 3, have the highest mean in the following variables: number of municipal networks to which the city belongs, incidents, complaints and suggestions through the municipal website, citizen participation webpage, number of languages on the tourism website and number of segments into which the municipal website is divided. Although these variables cover the three dimensions of the behavioural model of market orientation, the Generation of Information dimension has the highest representation. Cluster 4 is not characterized by higher means in almost any of the variables analyzed.

CONCLUSIONS

The investigation of the 18 Spanish regional capital cities, based on the analysis of a cluster of fifteen variables representing Kohli and Jaworski’s behavioural perspective of market orientation (1990), allows for the verification of four clusters that are differentiated in terms of the importance they attach to the different dimensions of market orientation based on the analysis of the municipal website content.

In this study, we propose a framework for measuring market orientation through the content of the municipal website (see table 2), in which we distributed the variables that allow us to measure market orientation in the three dimensions of Kohli and Jaworski’s behavioural perspective of market orientation (1990); it also allowed us to classify the variables in relation to the target public to which they are aimed (Resident, Tourist and Investor).

Although we are aware of the limitations of this research, which are due to the limited number of cities considered (regional capital cities in Spain), we aim to expand the number of cities to be analyzed and differentiate the cities within each dimension by the actions they aim at their respective target publics, taking into account the variables and the model template proposed.

WHO INFLUENCES WHO (STOCK AND BOND MARKETS)?

Tzu-Yi Yang, Ming Chi University of Technology
Yu-Tai Yang, Chung Yuan Christian University

ABSTRACT

In the literature of Longstaff(2008), the investigation was only limited to the existence of spillover effect among ABX indexes and the existence of contagious effect caused by different ranking of ABX index on stock and bond market during the sub-prime crisis period. In the researches such as Longstaff, Mithal and Neis (2003), Zhu (2004), Norden and Weber (2004) and Blanco, Brennan and Marsh (2005), it was pointed out that CDS market index is the leading indicator of stock and bond market index. Zhu (2004) had compared, in the period from 1999 to 2002, the credit risk and bond market price in the CDS market of US and Europe, and it was found that Yu-Tai t in the US and Europe market, CDS spread significantly leads the bond spread. Blanco, Brennan and Marsh (2005) had inspected CDS index and the credit spread of investing rank company in USA and Europe, it was found that co-integration long term relationship exists. When VECM model was used for analysis and measurement, it was found that CDS market index leads bond market index. Longstaff et al. (2003) had used VAR architecture to analyze CDS spread variation and the “leading-lagging” relationship between the corporate bond spread and stock return among 67 US enterprises, and it was found that CDS spread and stock return lead synchronously the corporate bond spread. Norden and Weber (2004) had analyzed, in the period from 2000 to 2002, the related stock market and CDS market for 24 US companies, 58 European companies and 8 Asian companies, it was found that CDS market index leads the stock market index. After summarizing related literature, it was ensured that CDS market has price finding function on bond market, that is, there is close relationship in the risk premium between CDS market and bond market; however, whether CDS market leads stock market, the empirical result in different literature is quite diversified. In this article, it is expected that CDS market will lead stock market because sub-prime credit crisis will lead to giant increase in the default rate in the global financial market, which will push CDS price higher directly and deepen the panic index among investors, and eventually, stock market will drop, hence, we conclude that CDS market index leads stock and bond market index.

National risk is mainly to evaluate the economic and political factor risk of a country, which has great influence on the financial market and investment environment. If the national risk of a country is higher than that of other country, then when financial crisis is encountered, the impact and loss of the country will be increased significantly. The most direct method to evaluate national risk is to measure the fluctuation of the financial market, for example, the caustic drop in the stock price, the significant increase of foreign exchange trading and the continuous increase of the accumulated selling from the foreign investors, etc. Merrill Lynch, in a very important report announced in 2008, mentioned that it has made ranking on all the countries around the world based on seven national risk variables, namely, 1. Capital shortage of current account, 2. Ratio of foreign reserve/short term external bond, 3. The percentage occupied by export on GDP, 4. The ratio between loan and GPD, 5. Growth in the personal credit loan, 6. Ratio between loan and deposit and 7 Capital adequacy ratio, hence, it can construct nine high risk countries and nine low risk countries. In that report, it was pointed out that countries with the weakest ranking in national risks include EMEA area, America and emerging EMEA area; however, newly emerging markets such as BRIC, Latin America and Asia have become the safest places. Generally speaking, a country's import and export situation, government deficit, the percentage occupied by monetary supply to the foreign reserve, external debt ratio, deposit interest, deposit and loan ratio and capital adequacy ratio of the financial industry, etc., are all variables that have significant influence on national risk. Variables such as the percentage occupied by financial deficit to GNP and oversea direct

investment have more influence on the risk of the developed countries; however, the control of external bond situation has more significant influence on the newly emerging countries. In this study, three influential factors such as representative financial deficit, oversea direct investment and external bond situation are selected from the economic aspects to explain if, after the occurrence of sub-prime crisis, such variables of each country will enhance the crisis contagion effect.

SUSTAINABILITY FOR HISPANICS IN CALIFORNIA: DO THEY REALLY CARE?

Mary Beth McCabe, National University

Ramon Corona, National University

Richard Weaver, National University

ABSTRACT

A study about the perceptions of well-educated Hispanics living in California regarding environmental sustainability.

Hispanics in the US are growing three times faster than non-Hispanics and now comprise 16% of the population, or more than 50 million. Just in the last 10 years, Hispanics grew 43%, equivalent to more than half of the growth of the entire US population. Given its importance and the undeniable needs of creating a conscious for sustainability in California, we developed this study to learn about the attitudes and perceptions of Hispanics regarding environmental practices, vs. non-Hispanics, in an effort to find out any differences between the two groups, and how this could be beneficial for many companies trying to market their products and services to this vibrant target market. The results from our survey showed that affluent Hispanics (\$ 100K +) showed a greater propensity to use less water and recycle waste than non-Hispanics in the same income group, and are more inclined to buy hybrid cars, which were both surprising. Furthermore, 23% of affluent Hispanics currently have a water heater at home; vs. only 5.7% of non-Hispanics. 10% of highly educated Hispanics have a solar water heater at home, vs. 6.7% for non-Hispanics in the same education group. This research also showed that Hispanics prefer TV and the web for media, and non-Hispanics selected newspapers and web, which is very relevant for marketers. Almost half of the Hispanics never use car pool, vs. a much lower 37% for non-Hispanics. Finally, in Social Media preferences, Facebook® ranked about the same for both groups, but Twitter® is only used by 5% of Hispanics, vs. 18.4% for their counterpart, which was also very interesting.

KEYWORDS: Hispanics, sustainability, environmental, marketing strategies, eco-friendly behavior

INTRODUCTION

Given the importance of the rapid growth of Hispanics in the US and particularly in California, associated with the impact of new and evolving environmental laws for all residents of California, as well as the promotion of a recycling culture and sustainability practices, the authors believe a new research is required to investigate the perception of attitudes of Hispanics living in California towards these practices, given its growing numbers in population. Moreover, the authors developed a research question or hypothesis to investigate whether or not Hispanics perceive and react differently than non-Hispanics to these environmental issues and practices. The implications of this research question are enormous since the marketing strategies and promotion channels to reach this population may have to differ substantially, given its cultural and social nuances. With this goal in mind, the authors created a survey to be sent electronically to all possible Hispanics and non-Hispanics persons, and discover these possible differences. If indeed there are distinct differences, the authors would incorporate some specific recommendations to reach this group more effectively.

LITERATURE REVIEW

According to the 2010 U.S. Census there were 308.7 million people living in the United States, of which 50.5 million (or 16%) were Hispanics or of Latino origin (2010 census). Hispanics grew at an amazing

rate of 43% between 2000 and 2010, four times faster than the general population at 10%. More than half of the growth of the entire US population was due to the increase in Hispanic population.

The preceding data enhances the relevancy of the Hispanic population in the United States and their influence in the long term future of our country, both politically and economically as well as the many cultural aspects that will be merged with the already diversified American melting pot. For marketers and business owners, this information is very relevant regarding the current and future marketing strategies to reach this lucrative market segment. In 2009, the U.S. Hispanic Buying Power reached \$ 978.4 billion, and is projected to reach \$1.3 trillion in 2014 (San Diego Ad Club, 2011), making it a very important part of the total US economy, estimated at \$15 trillion for 2011 according to the International Monetary Fund (IMF). Of the over 50 million Hispanics cited above, 63% are Mexicans, 9.2% Puerto Ricans, 3.5% are Cubans, and the rest are coming from Central America, South America and Spain. California has the largest Hispanic population in the US with over 14 million, or more than 37% of the total Hispanics, followed by Texas with 18.7%, Florida with 8.4%, and New York with 6.8%.

Hispanic or Latino? Numerous studies have been published about the possible differences between the term “Latino” and “Hispanic” in the U.S. to identify people coming from Mexico, Puerto Rico, Cuba or other Latin American countries. Most of them agree that there are really no differences and the terms are the same. Some of the commonalities of this group are that they all come from Spanish-speaking countries and have specific customs and values. Most Hispanics or Latinos identify themselves in relationship to their country of origin, e.g. Mexicans, Cubans, or Colombians. Other articles show that some people in this group associate the term Hispanic with the Spaniards who conquered many of this countries, with a negative connotation, and hence prefer to be recognized as Latinos. However, for the purpose of this article both terms will be used to identify this segment, interchangeably.

Current research in Hispanic Marketing is insufficient and do not reflect the rapid population growth which translates directly into economic clout. Furthermore, the complexity of the Hispanic Market is growing almost as fast as its sheer size as a result of second generations of Latinos as well as the constant influx of immigrants to the United States, both legally and illegally. Therefore, new research is needed in order to understand the dynamics and changes of this vibrant generation of Latinos that is influencing our society.

The challenge to reach this segment is so significant that several prominent universities, namely Southern Methodist University, Florida State University, UCLA, and De Paul already have Ethnic Marketing programs and in particular Hispanic Marketing programs, courses and seminars (Sebor, 2007).

Recent studies show that culture significantly impacts customer responses, levels of satisfaction, propensity to buy products and services, and most significantly the relationship between a company or brand and the consumer. Moreover, cultural differences do impact assessment of quality and satisfaction of products and services (Ueltschy & Krampf, 2003). As stated by the Office of Minority Health, “Hispanics/Latinos are disproportionately underrepresented in research activities. Without adequate and targeted research, Hispanics/Latinos are disadvantaged in policy making, resource allocation, program planning and program implementation activities” (Diaz, 2005).

SUSTAINABILITY AND GREEN ISSUES

There is extensive literature addressing sustainability/green issues for organizations, in general, and marketers, in particular. This literature focuses on the strategies (e.g., Chen & Lin, 2011; Hedman & Henningson, 2011; Parguel, Benoit-Moreau, & Larceneau, 2011; Muster, 2011; Laughland & Bansal 2011; Rüdiger 2011; Burgin, 2010, Raghavan, 2010). These strategies range from the economic value to companies of internal green activities to incorporating green into the company’s business model. Literature more directed to marketers focused on green brand management and promotional messages

(e.g., Yakup & Sevil, 2011; Chen, Y., 2010; Schubert, 2010; Dos Santos, 2009). Additional research examined consumer responses to sustainable/green products and services (Singh, 2011). These studies were completed in a great variety of locations around the world (e.g., Chen & Chai, 2011; Choi & Ng, 2011; Cohen, 2010; Huang, 2011; Savita, 2010; van Rijswijk, Fewer 2008).

The greatest surprise in reviewing the literature was the lack of academic research addressing questions about the attitudes and behaviors regarding environmentally sustainable activities. Searching a variety of databases of academic journals resulted in only one article directly on this subject (McCabe & Corona, 2011). The surprise was that this market, the second largest in the United States, was not the subject of intense research exploring its approaches to the growing effort to promote sustainable activities and purchases. Ignoring the unique dynamics within the Hispanic community would appear to be a poor business decision for organizations wishing to grow their market share.

METHODOLOGY

This research was designed as an exploratory study of the similarities and differences between Hispanic and non-Hispanic attitudes towards sustainability and their engagement in associated activities. A convenience sample was utilized, drawn from contacts maintained by the three researchers and databases of members of a variety of Hispanic professional organizations. While convenience sampling has known limitations, such as potentially not being representative of the larger population, this approach has been used productively in other studies, especially exploratory research. Particular attention was made to include a sizable proportion of known Hispanics in those invited to participate.

The survey instrument was developed to collect green activities and interests plus standard demographic information. The instrument was tested and appropriate modifications were made to increase both clarity and ease of completion. Potential responders were invited via email to participate. The instrument was made available utilizing SurveyMonkey.com over a two week period in November, 2011. A total of approximately 310 invitations were sent to potential responders. 144 completed the survey. This constituted a 46% response rate. Of these, 29 were discarded due to respondents not being residents of California. The remaining responses were sorted, tabulated, and correlated using standard statistical processes.

FINDINGS

After collecting all data from the surveys the answers to the direct questions were analyzed and tabulated, as well a series of cross tabulations based on the relevancy of the findings to take advantage of the data as much as possible. The findings were categorized as follows: Sustainable behavior and intentions, Energy, Media Preferences, Sustainable activities, and Demographics

Sustainable behavior and intentions

For all respondents to the question of “always” recycle, non-Hispanics recycle substantially more than Hispanics; 42% vs. 19% in print cartridges, 36% vs. 14% cell phones, 59% vs. 27% newspapers, and 61% vs. 25% plastic bottles, aluminum cans and glass. The highest recycling level for Hispanics was 27% for newspapers.

Figure 1: “Always” Recycles

Figure 2: High Income Green at Home

Between both groups who make \$100K or more, there is a large difference in the amount of water they plan to use over the next year. As we see in Figure 2 (above), Hispanics are 19.4% more likely to use less water than non-Hispanics in the year ahead. They are also 13.5% more likely (70.6% vs. 57.1%) to recycle waste than non-Hispanics.

The opposite was the result in lighting. Only 41% of the Hispanics plan to change their lighting or appliances to energy efficient, while 51.4% of non-Hispanics plan to make this change.

Figure 3: Higher Education Green at Home

If we take higher education as a basis for comparing both groups, Hispanics are far ahead in planning to use less water and change lighting to a more efficient one and about the same in their willingness to recycle waste.

FINDINGS RELATED TO ENERGY

The finding that was most revealing was that of energy-related products and services. Hybrids were a topic of interest as 44% of all our respondents plan to purchase a hybrid car next. That is an increase in

purchasing intentions from 14% who drive one now, and is a strong indication of behavior change. Looking at only Hispanics surveyed, 46% plan to buy a hybrid and 13% already drive one. That finding was higher than expected for both categories of Hispanics, purchase intention as well as already drive one.

Figure 4 High income Respondents Auto Behaviors/Intentions

When we looked further at those Hispanics who earn more than \$100,000, we saw even more revealing information. Of those Hispanics, 17.6% drive a hybrid and only 14.3 of non-Hispanics with that income do the same. Hispanics drive more hybrids at higher income levels.

High income Hispanics are more inclined to purchase a hybrid car, (53% vs. 45.5%) than their counterpart high income non-Hispanics, as shown in Figure 4 above.

Figure 5 Higher Education Respondents Auto Behaviors/Intentions

For the higher educated Hispanics, 10% drive a hybrid now and 30% plan to purchase one next time. For non-Hispanics, 14.6% drive a hybrid now and 39.1% plan to purchase a hybrid next. What this tells us is that the more educated Hispanics are different from those with money. These Hispanics are not greener than their non-Hispanic counterparts. With higher education, the preference to buy a new hybrid is 30% less for Hispanics than non-Hispanics. This finding surprised the researchers.

California is known for being a state in love with the automobile. We wanted to learn more about vehicle mileage comparing Hispanics to non-Hispanics. In the more than \$100K income segments, the major finding was that some Hispanics are not driving cars with good mileage. Hispanics that drive 21-30 MPG were 36%. Non-Hispanics in the same category are at 60%. For the more than 30 mpg, Hispanics have the edge at 29.4% vs. non-Hispanics at 22.9%. For the middle, 21-25 mpg, non-Hispanics are at 34.3% vs. Hispanics at 29.4%.

The 21-25 mpg segment was very similar among both Hispanics and non-Hispanics, averaging at about 33-34% for all income levels surveyed. There was a larger difference in Hispanic vs. non-Hispanic as the mpg numbers increased or declined, especially in the high mileage categories, i.e., more than 30 mpg. For non-Hispanics in over 30 mpg vehicle mileage was 24% of respondents and for Hispanic responders the more than 30 mpg mileage was 15% (all respondents). One in four non-Hispanics has a primary vehicle with mpg greater than 30 mpg. The opposite was true for the low mileage vehicles, with 10% of Hispanics primary vehicle getting less than 15 mpg. They may be driving older trucks. Hispanics are paying attention, as 43% of them are now driving cars with more than 26 mpg. That number is similar for non-Hispanics, at 45%.

For the higher educated, 45% drive a vehicle with 21-25 mpg. This 30% drive vehicles with more than 26 mpg. For highly educated non-Hispanics, 50% drive vehicles with more than 26 mpg, clearly a large difference.

Figure 6: Respondents Who Answered "Yes"

Solar Water Heaters: Among high income Hispanics (\$100k+) 23.5% have solar water heater vs. only 5.7% of non-Hispanics with \$100k incomes have solar water heaters.

Solar Discussion: Regarding solar energy, we found that none of our Hispanic respondents had solar PV installed; however, 13% had a solar water heater, nearly double of the non-Hispanic response. The average cost of installing solar PV is still considerable, and the cost of solar water heaters is roughly one quarter to one third of the price. Our non-Hispanics at 10.5% had installed solar PV, and only 7% had solar water heaters, which was another unexpected response. Looking at the higher incomes, still zero Hispanics have solar PV, and a higher 11.4 non-Hispanics have solar PV homes. Among high income Hispanics 23.5% have solar water heater compared to only 5.7% of non-Hispanics with this feature. This finding indicates that for the same incomes, four times as many Hispanics chose to use a solar water heater than non-Hispanics. Looking at the more educated graduate Hispanics, 10% have a solar water heater at home vs. 6.5% for non-Hispanics, consistently lower ownership rates for this segment.

Green Event Participation: Among these \$100k incomes, 70.6% of Hispanics have participated in green events, vs. 68.6% of non-Hispanics who have participated. Slightly more Hispanics have participated in green events at the high income levels. That finding changes if you look at our summaries, where only 56% of Hispanics participate in green events vs. 72.4% of non-Hispanics participate. It would seem that the more Hispanics earn, the more likely they become active in green activities. Of higher educated Hispanics, 60% have been involved with green events vs. 68% for non-Hispanics with graduate degrees.

Media Preferences and Demographic

Hispanics clearly responded to the question about what media they prefer to get information about green products and services, and with higher response rates to electronic news versus print or magazines. (Figure 7) Hispanics slightly prefer TV over the web and then radio. Non-Hispanics prefer the web, then Newspapers/Magazines, then TV then radio. (See Figure 7 below) Nearly 70% of those Hispanics responding overall indicated a preference for TV to get their information. The findings about Facebook’s popularity with both Hispanics and non-Hispanics are very similar, at nearly one third of respondents. However, what was not expected was the difference in Twitter response. Three and a half times more non-Hispanics prefer Twitter to get their information than Hispanics.

Figure 7: Hispanic vs. Non-Hispanic Media Preferences on Green Information Sources

As shown in Figure 8 below, the top choice for Hispanics earning \$100K and over is TV and second is the web. Both choices were for 60% or greater of the respondents. For non-Hispanics, it’s very different: the top choice was newspapers, with nearly 60 % and the second was the web, with nearly 55%. As incomes rose for non-Hispanics, newspapers became more important as a resource for information. Non-Hispanics in the higher income categories did not rate other media as their preference for information about environmental issues. For non-Hispanics, they selected TV at 42.4% vs. 66.7%. Facebook was similar, with Hispanics ranking that higher. Hispanics preferred Twitter only 6.7% compared to non-Hispanics, who preferred it 18.2%, nearly 3 times more frequently.

Figure 8: High Incomes Media Preferences

The Figure above describes the high earning Hispanics vs. non-Hispanics choices for media to inform them about environmental issues. TV is the most frequently selected, followed by the internet for Hispanics when it comes to learning more about environmental issues. Respondents were asked to select all that apply. For non-Hispanics, magazines and newspapers were the top choice, followed by the internet and then TV.

The top choice for Hispanics with graduate degrees is web ads and websites, with second being TV, and then radio. Only 10.5% use Twitter. The top choice for non-Hispanics with graduate degrees is web ads, then magazines/newspapers, and then TV. 18% are using Twitter, 80% more than Hispanics in the same education category. These findings had us consider selective perception and if people are paying attention to messages, they may be likely to act.

Figure 9: Higher Education Media Preferences

Sustainable activities

Figure 10: High Income who Always Pay Attention to Information

In responding to the “always” pay attention question for the high income category in both groups, Hispanics want to know more about Solar Energy and non-Hispanics were more interested in water than solar energy.

The answer “always” for Hispanics was water with 47%, vs. non-Hispanics was only 37%. For Solar always were 41% vs. 20% for non-Hispanics. Hybrid was 31.3 for always for Hispanics and 14.3 for non-Hispanics.

In the never category, for Hispanics: Hybrid was 18.8, solar 17.6 and water use and recycling 5.9, were the same. For non-Hispanics, never Hybrid was 14.3, Solar 11.4, Water was 8.6 and recycling was 8.8. So, in summary for the never, Hispanics were more on never with hybrid and solar (more expensive propositions) and they were less likely to say never on the water use and recycling, which are less expensive.

For the question about willing to pay for organics in Figure 11 below, Hispanics responded 35.3% sometimes vs. 48.6 % for non-Hispanics. Clearly, Hispanics are not willing to pay as much, which could be attributed to insufficient information.

Figure 11 Sometimes Willing to Pay Extra for Organics

Figure 12 Never Use Shared Transportation

Of all Hispanics surveyed, 41.2% never use a car pool vs. 37% for non-Hispanics. 70.6% of Hispanics never use public transportation, and of non-Hispanics, 67.6 % never use public transportation. Although the difference is not significant, Hispanics are slightly less likely to use shared transportation than non-Hispanics.

Compare Hispanics to non-Hispanics on saving water at work vs. at home. As depicted on Figure 13 below, Hispanics and non-Hispanics tend to save 10% more at home than at work. What this may mean is they have more control over their home environment. Hispanics are slightly less inclined to do both of these activities always or most of the time.

Figure 13: “Always/Most of the Time” Save Water

Finally, Figure 14 below shows that Hispanics tend to reduce their printing and are more concerned about energy saving lights, than non-Hispanics.

Figure 14: Always print less/use energy saving lights

CONCLUSIONS

After reviewing the results, we conclude that there are substantial differences in Hispanics with higher income and education than the perception of the general public has for this Hispanic market in general. These variables are relevant in comparing both Hispanics and non-Hispanics regarding the perceptions and attitudes about the environment, and more specifically recycling newspapers, plastic bottles, cell phones and cartridges. For the affluent Hispanic with income of over \$100k, the study showed a greater propensity to use less water and recycle waste than non-Hispanics, which was surprising. The results were different using Higher Education for both groups and therefore can infer that these two independent variables are very significant for both groups, and with a low correlation factor.

High income Hispanics are more inclined to buy a hybrid car than non-Hispanics that was also an interesting discovery from this study. 10% of educated Hispanics have a solar water heater at home vs. only 6.7% of non-Hispanics. Similarly, 23.5% of high income Hispanics has a water heater at home vs. only 5.7% of their counterpart. Regarding involvement in green activities, it would seem that the more money Hispanics make, the more likely they become active in green activities: 60% of them with graduate degree are involved vs. 68% of non-Hispanics with same education.

Regarding attention to media, Hispanics prefer TV and the web, and non-Hispanics prefer newspapers as number one, followed by the web. This may be of some interest for marketers trying to reach the Hispanic segment. Interestingly, Hispanics responded very low to their attention and involvement with Twitter (only 5.1%) vs. 18.4% for non-Hispanics. Facebook was very similar for both groups. The study also revealed that Hispanics are less likely to pay for organic products than non-Hispanics. In regards to transportation, 41.2% of Hispanics never use car pool vs. 37% for non-Hispanics, and the ones who never use public transportation was consistently high for both, 70.6% for Hispanics vs. 67.6 % for non-Hispanics.

These findings bring some significant light to the behaviors and attitudes of Hispanics vs. non-Hispanics in California regarding environmental issues, which can be used for marketers in conveying their messages to this important growing segment of the population. Nonetheless, more in-depth research is needed to find out other variables and factors that may affect the results.

BIOGRAPHY

Dr. Mary Beth McCabe is a full-time Professor at the School of Business and Management at National University, where she is lead faculty for Marketing. She has a Doctorate in Marketing from Alliant International University (San Diego) and MBA in Marketing from DePaul University (Chicago). Her research is concentrated in the fields of Hispanic Marketing, Media and Sustainability and her contact email is mmccabe@nu.edu

Dr. Ramon Corona is a full-time Professor at the School of Business and Management in National University, where he teaches Marketing and Strategy courses. He has a Ph.D. in Education from Universidad Iberoamericana (Tijuana, Mexico) and a Postdoctoral Certificate in Marketing from Tulane University (New Orleans). His main research is in the field of Marketing, specifically in Retail and Hispanic Marketing, and his contact email is rcorona@nu.edu.

IS COSTCO BETTER THAN WAL-MART? A COMPARATIVE ANALYSIS BASED ON ENTERPRISE MARKETING EFFICIENCY

Ramon Corona, National University

ABSTRACT

The purpose of this research was to analyze the operations of Wal-Mart and Costco during the period from June 2006 until August 2008 from the standpoint of the efficiency of their operations in utilizing the resources to create shareholder's value, using key performance and enterprise marketing ratios. This study is relevant given the different business models and strategies used by both companies, as well as their intense rivalry in the retail industry. The results showed that Wal-Mart is clearly superior in attracting investors willing to pay a premium for the stock, but Costco is far more efficient in the use of Selling, General and Administrative expenses to generate profits. Furthermore, the Maximum Earnings Market Share (MEMS) calculations evidenced that Costco could have made \$3,660 million more in that period, whereas Wal-Mart overspent \$26,300 million more than needed to maximize earnings (EBITDA) in the same period.

Key words: marketing, enterprise marketing, market value, efficiency, market share, Costco, Wal-Mart, retail industry.

INTRODUCTION

The retail industry in the US is represented by four companies that compete intensely to attract more customers and increase sales and profits. These companies are Wal-Mart, Costco, Target and Sears, and each one has its own business model, follows a unique strategy, has different locations and store sizes, and generates different sales revenue. Each faces unique challenges and targets markets, and uses distinct positioning strategies. Most of them operate on a global scale and confront different cultural challenges and adaptations to survive in an increasingly competitive landscape. Wal-Mart is the behemoth that dominates the industry with its traditional low prices everyday (recently changed to "Save money. Live better") approach, and has become the largest company in the world with more than \$378 billion dollar in sales in 2008 ([Wal-Mart](#)). Costco, on the other hand, has been growing steadily during its twenty-six years of operation and has become a world leader in the warehouse type of sales, with operations in seven countries of the world. Moreover, Costco has created a good deal of excitement to its more than 29 million members by offering premium, new and seasonal items including fine crystal, famous names' handbags, the latest in consumer electronics, plasma TV's, gourmet cheeses, imported wines, leather jackets and lobster (McGregor, 2008). Target has been constantly refocusing its retail strategy with a unique combination of stores decorated in a bright, red color and a combination of soft goods, appliances, electronics, house wares, and gifts that has successfully positioned its stores in the minds of the consumers. Finally Sears, the over 100-year-old company well known for selling large appliances and tools to many generations, which purchased 54 K-Mart stores in 2005 to become one of the largest retailers in the United States.

The purpose of this research is to analyze the operations of Wal-Mart and Costco in the ten quarters from June 2006 until August 2008 from the standpoint of the efficiency of their operations in utilizing their resources to create shareholder's value by using key performance and enterprise marketing ratios. This study is relevant, given the different business models and strategies used by both companies, as well as their intense rivalry in the retail industry. Moreover, there is a growing concern around the world about

the strategies and tactics required to compete with the giant Wal-Mart and its enormous economies of scale that is putting many companies out of business world-wide.

Strategic group

First, a selection was made a strategic group of companies, or cluster, to create a sub-segment of the industry with true competitors. The selection of these companies is based on the concept of strategic group within an industry defined as a set of companies that can (or might) serve common customer's needs, and have (or might acquire) equivalent resources ([Competing for Customers and Capital](#), 15). In other words, companies in a strategic group are essentially competing for the same customer, both existing and potential. The companies selected for this strategic group were Wal-Mart, Costco, Sears and Target. Although very different in size and resources, these four companies have a large amount of common products and services that appeal to a similar client, but each one with a different approach, business model, positioning and pricing strategy, number of stores and their size, number of items per store, promotions, and advertising strategies.

Sears (SHLD)

Sears Roebuck and Company started in 1886 and has been the quintessential retailer for over 100 years ([Sears's profile](#)), but in 2004 merged with K-Mart and formed a new group consisting of 1,426 K-Mart stores across 49 states, 872 full-line Sears stores and 300 specialty stores. Sears is a strong competitor in appliances, automotive and hardware stores nationwide, and with the creation of its own brand, Sears Home Central, it has become an icon in the retail industry for every household in the nation (Moon, 2005). Sears has postponed global expansion due to the disappointing financial results in the US, and thus concentrated in Canada and Mexico only, with mixed results. Sears acquired Land's End, a leader in catalogue sales of clothing for middle to middle-upper class, to complement their line of products and now has available a large variety of branded products in their stores to attract more customers. On June 30, 2004, Sears agreed to buy 54 K-Mart stores with an investment of \$620 million (Canlen, 2004) and also lease seven stores from Wal-Mart in an effort to revamp its Sears Grand store concept and improve its market penetration.

As shown in table 1, Sears Holdings (SHLD) average sales per quarter were 12,655 million for the period under examination, corresponding to a revenue share of 9.03% for this strategic group. Sales reported at the end of the second quarter of 2008 (July 31) reached \$11,762 million, with a stock price of \$81.00/share. On April 1, 2009, the price was \$52.13/share ([Sears](#)), with a hefty 35.64% loss in market value in only nine months. This is arguably due in part to the economic recession in the US and all over the world.

Company	Aver. Sales \$	Aver. COGS \$	Aver. Gross profit	Aver. SG&A \$	Aver. EBITDA \$	Average Market value \$	Aver. Share of Value SOV %	Share of Revenue SOR %
Sears Holdings	12,655	9,114	3,541	2,864	677	20,344	6.70	9.03
Target	15,313	10,198	5,115	3,439	1,677	46,425	15.86	11.10
Wal-Mart	92,518	68,515	24,003	17,170	6,832	200,135	68.19	67.29
COSTCO	15,313	14,621	692	1,623	811	26,368	8.99	12.39

Table 1: Financial data of the four companies for 2006-2008, in millions USD.

Target (TGT)

George D. Dayton opened Good fellows in downtown Minneapolis in 1902, and marked the beginning of Target Corporation (TGT), even though the first Target store, as we know it today, was opened in 1962 with the idea to become a mass market discount merchandiser and gradually developed into a store chain with trendy merchandise at affordable prices, aimed to deliver a great retail experience and provide the blend of style, substance and oh-so-satisfying shopping ([Target](#)). Target follows a business model of a large department store and has 1,685 locations in 48 states in the US (including 218 super Target locations), combined with product lines that are predominantly everyday essentials and fashionable, differentiated merchandise at exceptional prices ([Target](#)). Their brand image is essential for their marketing strategy, including the store size and image, as well as its appealing bright red color and bulls-eye symbol.

Target sales averaged \$15,313 million per quarter in the period under examination (Table 1), equivalent to 11.10% of revenue for this strategic group of companies. The latest stock price reported on April 1, 2009 was \$36.06/share ([Target](#)), which is 29% lower than a year ago when it was at \$50.98. Similar to the Sears stock, Target's stock price is affected by the reduction in sales due to the slowing down of the economy.

Both Sears and Target follow a department store retail format, which is in the decline stage according to some experts (Moon, 2005). A number of store chains with similar business model have vanished recently, including Montgomery Ward and Mervyns' ([Mervyns](#)).
Wal-Mart (WMT)

The behemoth of commerce and largest retailer in the world was founded in 1969 by Sam Walton, the richest man in the USA from 1985-1988 according to Forbes magazine ([Sam Walton](#), 2008). In 1984, the company opened three Sam's Club operations (to compete with Price Club – now Costco), and a Wal-Mart Supercenter in 1988.

Wal-Mart's sales in 2008 were 378.79 billion ([Wal-Mart](#), 2009), and became the largest company in the world in terms of sales revenue. Wal-Mart operates 971 discount stores, 2,447 supercenters, 132 neighborhood markets, and 591 Sam's Clubs in the United States; and 21 units in Argentina, 313 in Brazil, 305 in Canada, 149 in Costa Rica, 70 in El Salvador, 145 in Guatemala, 47 in Honduras, 394 in Japan, 1,023 in Mexico, 46 in Nicaragua, 54 in Puerto Rico, and 352 in the United Kingdom, as well as 202 stores through joint ventures in China ([Wal-Mart](#)). Its main business principle, "low prices every day", was successful until 2005 when they shifted into an expansion approach (which caused some controversy) and changed their slogan to "Save Money, Live better", which seems to be working very well, according to the company. In comparison with other retailers like Costco, Wal-Mart pays 40% lower salaries and fringe benefits to its employees (Holmes & Zellner, 2004); its fundamental principle to achieve low prices is "Low wages for its employees, unrelenting pressure on suppliers, products cheap in quality as well as price, off shoring jobs" (Cascio, 2006). Wal-Mart's (WMT) stock price as of April 13, 2009 was \$51.53 per share.

Nonetheless, Wal-Mart is definitely an emblem in retail operations worldwide and has a well-earned position as the global leader in low prices and product selection. Wal-Mart competes intensely with other global retailers like Target, Sears and Costco due to its capacity to offer lower prices than anybody else (category killer), and creates major concerns to other specialized retailers like Home Depot, Office Depot, Circuit City, and JC Penney's, because it is gradually absorbing many of their customers as well.
Costco (COST)

Mr. Solomon "Sol" Price sold Fed-Mart in 1975 to embark in a new retail venture geared toward small businesses: Price Club. Price invited Jim Sinegal, who started downloading mattresses at the age of 18 in Fed-Mart, to help him open the first Price Club warehouse in San Diego in 1976 (Cascio, 2006). He

learned from Mr. Price the business of a high-volume warehouse with only a limited number of products, and left Price in 1983 to start Costco in Issaquah, Washington, with partner Jeff Brotman. After competing against Price Club for many years, Costco merged with Price some years later (and became PriceCostco). Later Sinegal bought Price out and remained as CEO of Costco. With a very casual way of running business, he created an empire of more than 544 stores in 40 states in the USA and eight world countries (McGregor, 2008), with yearly sales of \$72 billion dollars ([Costco](#)). Sinegal's main philosophy is to keep low prices combined with a peculiar assortment of products, to create value-added for the more than 29 million members in a no-frills environment of carefully selected merchandise. Costco's warehouses carry only about 4,000 products, compared with supermarkets that have 40,000 items, and some Wal-Mart supercenters have as many as 150,000 (Boyle, 2006). From those 4,000 products, approximately one-fourth (1,000) are new and seasonal products, or special purchases, such as expensive jewelry, European handbags, leather jackets, and many well known branded products that attract numerous affluent members. Regular products include food, health and beauty items, tires, consumer electronics, wine (Costco is biggest wine merchant in the USA), soft goods, groceries, and even caskets (Funeral Monitor, 2004, p.2, as cited in Chevalier, 2008). Sinegal's strategy also includes additional member services, namely new car purchases; business and personal insurance, roadside assistance, home improvement items (drapes, kitchen countertops, and garage doors), travel, online investments, as well as a very lucrative website operation that offers exclusive products to its members. Sinegal not only pays and treats his employees very well, as noted before, but instills in them his "common business sense" and his ethical business principles: obey the laws, take care of our customers, take care of our people, and respect the suppliers (Davis, 2008). Costco's (COST) stock price as of April 13, 2009 was \$46.41 per share.

Marketing Efficiency Ratios

the financial data available on these companies, this study analyzes key m ratios including Share of Value (SOV), Share of Revenue (SOR), Value-Sales Differential (VSD), Risk-Adjustment Differential (RAD), Sales Per Dollar (SPD), Enterprise Marketing Expenses (EME), Marketing Efficiency (MER), as well as Marketing Efficiency Market Share (MEMS), in order to assess each company's efficiency in the use of their resources to generate profits.

Share of Value (SOV) is defined as the percentage of market value of a company compared with the total market value of the companies of a specific strategic group. Therefore, for a company *i*, the share of value will be calculated as follows:

$$SOV_i = \left[\frac{\text{common stock price} \times \text{Number of shares outstanding}}{\text{market value of all companies in the strategic group}} \right] \times 100$$

Share of revenue (SOR), on the other hand, is the percentage of sales of a company in relationship to the total sales of all companies for that specific strategic group. It will be calculated as follows:

$$SOR_i = \left[\frac{\text{total sales}_i}{\sum \text{sales of all companies in that strategic group}} \right] \times 100$$

Value Sales Differential (VSD) is the difference of share of value (SOV) minus share of revenue (SOR) ([Competing for Customers and Capital](#), 19), [VSD = SOV – SOR] and can be interpreted as the premium or discount that investors are willing to pay for a company stock in relationship to its revenue. If the VSD is positive, it means that the investors are willing to reward a company with a higher market value than its revenues, which is good. Negative VSD, on the other hand, denotes that the investors are discounting the market value of a company relative to its sales revenue, which is not good. In other words, investors are

willing to pay more for the stock of a company because they expect it to reach a higher value than its sales revenue indicates.

The competitive value-sales differential (δ_{ij}) for company i in a strategic group j populated by n firms in any given period is:

$$\delta_{ij} = \left(\frac{v_j}{V_j} - \frac{r_i}{R_j} \right) \times 100$$

In order to adjust for enterprise marketing risk and compare data across companies, the VSD values of a company are divided by their standard deviation to create the Risk-Adjusted Differential (RAD) ratio, to compensate for dispersion from the mean deviation ([Competing for Customers and Capital](#), 19). RAD also allows for comparison between large and small companies, independent of sales revenue.

Enterprise Marketing Efficiency (EME) can be measured in two ways; the first is more linear and intuitive form called Sales per Dollar (SPD), and it is defined as the relation between total sales of a company divided by the amount of dollars invested in enterprise marketing expenses ([Competing for Customers and Capital](#), 20).

Enterprise Marketing Expenses (EME) is the total amount invested in Selling, General and Administrative Expenses (SG&A), directly from a company's income statement. The second method to measure the efficiency in using enterprise marketing expenses is a non-linear, more theoretical ratio: the Marketing Efficiency Ratio (MER) and can be described as the relationship between the enterprise marketing expenses of a company, and its current market share ([Competing for Customers and Capital](#), 112). If the firm spends less than required to maintain the current market share, the company is more efficient, and the MER is less than one. If the company spends more than required to maintain a specific market share, then it is less efficient and its MER is more than one. When the company spends exactly the amount required to maintain the current market share, MER is equal to one. Both of these Enterprise Marketing Efficiency ratios work well only if we assume a positive correlation between sales and Selling, General and Administrative expenses (SG&A).

Enterprise Marketing Expenses are the SG&A of a company and can be calculated for a strategic group as:

$$f = \sum_{l=1}^n f_l \text{ where } i \neq l.$$

n = number of competitors, and f = company's EME ([Competing for Customers and Capital](#), 250).

In order to maximize the use of enterprise marketing expenses and achieve the desired market share, it becomes necessary to determine the Cost Per Point (CPP) of market share, which is the required amount of money to buy the first market share point, and is calculated as:

$$ki = (f \times x_i) / 100$$

The Profit Per Point (PPP) is the profit derived from each point of market share. The larger the gross profit of a company, the larger the profit per market share point.

The theoretical enterprise marketing expenses y for company i required to achieve a target share m of revenues is:

$$y_i = (f_i \times m_i) / (100 - m_i)$$

The Maximum Earnings Market Share, MEMS is calculated as follows:

$$\widehat{m}_i = 1 - \sqrt{\frac{k_i}{p_i}}$$

Where m_i = Company maximum earnings market share,

k_i = cost per point, CPP,

And p_i = profit per point, PPP ([Competing for Customers and Capital](#), 251).

Ideally, a company aims to reach a level of market share such that maximizes its revenue and that is calculated using Maximum Earnings Market Share (MEMS). In other words, MEMS is the point in market share where the company maximizes profits.

Gross margin comparison

Based on the selected financial data ([Compustat](#)) of all four companies in this strategic group, Chart 1 (below) shows the average gross margin for each company. Costco has the lowest gross margin of 14.0%, followed by Wal-Mart with 26.0% and then Sears slightly higher with 27.9% and finally Target with 33.5%. As a warehouse-type operation, Costco displays a substantial price advantage over Wal-Mart of almost half the gross margin, and even larger compared with the other two rivals.

Chart 1: Average gross margin percentages for the last ten quarters

Performance

From Table 1 below, the result indicate that Costco is doing very poorly with a negative VSD of 3.40, which means its stock is traded at a lower value in relation to its sales, versus Wal-Mart with a positive VSD of 0.90 reflecting the willingness of its shareholders to pay a premium for the stock versus its sales revenue. From a different viewpoint, Costco has 11.67% of total sales in that group, but only 8.60% of the market value, which implies is doing better in terms of sales revenue than is reflected in the financial markets. In the case of Wal-Mart, investors are willing to pay 18% more for its stock compared with actual sales revenue, based on the expectation that the stock will increase its value. Sears is also negative and Target is the champion of the group with a positive VSD of 4.61 value-sales differential, which could be translated as the investors willing to reward Target and expect market price gains in the future. It is interesting to note than on March 31, 2003, Wal-Mart had a SOR of 62.12% for this same strategic group of companies ([Competing for Customers and Capital](#), 179), compared with 67.29% for the period under

examination, with a net gain in share of revenue of 5.17 points in five years. It is reasonable to assume that this is due in part to the closing of K-Mart stores and the shifting of customers to Wal-Mart, or the improvement in Wal-Mart's positioning strategy, or a combination of both. On the downside, value sales differential in 2003 for Wal-Mart was a positive 19.87, compared with only 0.90 for this period, reflecting perhaps an over-priced value of its stock at that time, or a higher expectation from investors as a result of intense competition.

Table 2: Performance data

Company	Share of Value % SOV	Share of Revenue SOR	Value-Sales Differential VSD	Risk-Adjusted Differential RAD
Sears Holdings	6.70	9.03	(2.18)	(1.45)
Target	15.86	11.10	4.77	2.33
Wal-Mart	68.19	67.29	0.90	0.23
COSTCO	8.99	12.39	(3.40)	(1.75)

Source: Financial data retrieved from WRDS (Wharton Research Data Services) from 12/3 thru 12/19 2008 from <http://wrds.wharton.upenn.edu/ds/compq/fundq/> Compustat North America.

Charts 2 and 3 illustrate the value-sales differential (VSD) for both companies. Wal-Mart has positive and negative results in the period under examination, and an average of a positive of 0.9 for VSD. Costco (Chart 3) on the other hand, has been on the negative side for the same period. This explains a clear trend for Wal-Mart having a higher market value based on investor's perceptions and expectations, than Costco. VSD can be interpreted as the "price/revenue" ratio of the firm ([Competing for Customers and Capital](#), 38) in which the positive (or negative) results of sales is rewarded (or discounted) by investors, similarly to the "price/earnings" ratio in the financial markets. Furthermore, VSD is more meaningful, for it not only relates the price of the stock to the actual sales revenue, but also is linked to similar data of the other companies in the same strategic group. In other words, from Table 1 we can infer that Wal-Mart had a very comparable SOV and SOR, instead Costco had a much higher SOR (12.39%) compared with the corresponding SOV of only 8.99%. On the other hand, VSD is very sensitive to the number of common stocks outstanding; Wal-Mart had 4,167 million common stocks back in April of 2006, and has 3,399 million in June 2008, which is not a significant variation, whereas Costco had 475 million in April 2006, and 434 million by the last period under examination.

Chart 2: Wal-Mart VSD

Chart 3: Costco SOV

Risk-Adjusted Differentials (RAD)

Chart 4 below exhibits the RADs for all four companies in this strategic group (minimum, average and maximum values), where TGT and WMT have positive RADs (value premiums), while both SHLD and COST are negative (value discounts).

Chart 4: Risk-Adjusted value differentials for the strategic group

Enterprise Marketing Efficiency

In order to determine how efficient these companies are in generating sales as a result of these enterprise marketing expenses, we calculate Sales Per Dollar (SPD) as a first measure of enterprise marketing efficiency ([Marketing meets Finance](#)). Chart 4 below shows that Costco generates an average of \$10.32 dollars of sale for every dollar spent in SG&A on average, whereas Wal-Mart generates only \$5.44. In other words, Costco generates twice as much sales volume for every dollar spent in SG&A expenses; therefore, Costco is 47.28% more efficient than Wal-Mart in using enterprise marketing expenses. Again, sales per dollar (SPD) is based on the assumption that sales have a positive correlation with SG&A expenses. SPDs for Sears and Target are \$4.41 and \$4.61 per dollar of sales generated, respectively.

Costco is the clear leader in this category based in part on its business model of no-advertising and using word-of-mouth promotion (viral marketing). Sinegal says: “Advertising becomes like a drug, once you start doing it, it is very hard to stop. We feel that the most successful type of advertising is word-of-mouth. When people are saying good things about you, it is much more important than when you say them about yourself” (Davis, 2008).

Chart 5: Sales per dollar (SPD) of Costco and Wal-Mart

Table 4 below shows the MERs for the companies of the strategic group and it also shows, that on average for the period under examination, Sears, Target and Wal-Mart are spending more in enterprise marketing expenses (positive MER), and Costco is by far more efficient with a MER of only 0.49. This means that Costco spends less than half in SG&A expenses to keep its current average of 12.39% share of this market. Wal-Mart on the other hand, spends on average 5% more than required to keep its current 67.29% of the market. Through analyzing these facts we can imply that, despite the disproportion in sales volume and market share, Costco is by far more efficient in this category than Wal-Mart; that is to say, Wal-Mart could have spent less in EME and would have been more efficient and earned more revenue. We can also interpret this as Wal-Mart having to spend \$1.05 for enterprise marketing assets that would cost \$1.00 to a strategic competitor; also, Costco spent only 49 cents for enterprise marketing assets that would cost \$1.00 for another strategic competitor.

Table 3 Enterprise Marketing Expenses for last 10 quarters

Company	Marketing Efficiency Ratio (MER)	Cost Per Point average CPP \$	Profit Per Point average PPP \$	Maximum Earnings Market share MEMS	Share of Revenue SOR	Under (-) or Over (+) spending
Sears Holdings	1.27	3.45	3.84	4.9	9.03	+4.13
Target	1.27	3.49	4.60	11.42	11.10	- 0.32
Wal-Mart	1.05	7.81	3.57	15.7	67.29	+ 51.59
Costco	0.49	1.50	1.94	9.6	12.39	- 2.79

Source: Financial data retrieved from WRDS (Wharton Research Data Services) from 12/3 thru 12/19 2008 from <http://wrds.wharton.upenn.edu/ds/compq/fundq/> Compustat North America.

Interestingly, Wal-Mart had a very good MER of 0.83 in 2003 and dropped (i.e. became less efficient) to 1.05 in the last ten quarters under examination in this paper. Costco on the other hand, remained the same with a consistent MER of 0.49 ([Competing for Customers and Capital](#), 179).

Furthermore, for the same period of time, Costco was two times more efficient than its closest competitor in this group and spent only 9.51% of sales on enterprise marketing resources, compared with 18.55 for Wal-Mart, 22.72 for Target, and 22.62 for Sears.

The data on Table 3 indicates that the cost per point of market share for COST is \$1.50 to make \$1.94 of profit (PPP), which is slightly more than the cost so it would make sense to invest more in EME to reach the peak level when CPP = PPP. On the contrary, WMT has a CPP of \$7.81 to make only \$3.57 of profit, which means its incremental cost for each point of markets share is too costly. In comparing these two companies, Costco is significantly more efficient in managing its enterprise marketing expenses than Wal-Mart.

Table 4: CPP's for the strategic group

Incremental Cost Per Basis Point	COST	SHLD	TGT	WMT
May-06	\$1.29	\$2.97	\$3.12	\$6.82
Aug-06	\$1.47	\$3.26	\$3.46	\$6.92
Nov-06	\$1.39	\$3.26	\$3.42	\$7.51
Feb-07	\$1.59	\$3.24	\$3.51	\$7.60
May-07	\$1.39	\$3.24	\$3.09	\$7.43
Aug-07	\$1.59	\$3.52	\$3.48	\$7.74
Nov-07	\$1.53	\$3.61	\$3.74	\$8.19
Feb-08	\$1.71	\$3.66	\$3.75	\$8.70
May-08	\$1.51	\$3.81	\$3.45	\$8.49
Aug-08	\$1.51	\$3.88	\$3.85	\$8.71
average	\$ 1.50	\$ 3.45	\$ 3.49	\$ 7.81

Chart 6 highlights the gaps between Costco's actual market share and its maximum earning market share (MEMS) during the period in study, and notably the peak in potential earnings for a market share of 41.1% of revenues in August 2008. The average differential or gap in market share for Costco during the period under examination is an average of 9.2 percentage points and translated into lost earnings (EBITDA) would be equal to \$3,660 million. Similarly, Wal-Mart had more market share than needed to maximize profits, consequently it could have saved (or increased EBITDA) in the amount of \$26,833 million during the same period. Chart 7 highlights these gaps in actual versus maximum earnings market share for Wal-Mart.

CONCLUSIONS

This analysis shows that Wal-Mart has the largest market share of this strategic group of retailers, and a better (positive) Value-Sales Differential (VSD) compared with Costco, which indicates that investors are willing to pay a premium for WMT stock in relationship to its share of revenue. Costco on the other hand, has the opposite situation with a negative VSD, which implies that investors discount the price of its stock in relation to its share of sales. Interestingly, Wal-Mart's VSD has gone down from a positive 19.87 in 2003, to a positive of 0.90 in 2008, which suggests that perhaps it was more dominant in the financial market than today, but further investigation is necessary to ascertain possible causes. The Risk-Adjusted Differentials corroborate these trends for both companies.

Comparing the sales generated by investing in enterprise marketing expenses, the data demonstrates that Costco generates on average \$10.32 of sales per dollar invested, whereas Wal-Mart only generates \$5.44, which means that Costco is twice more efficient than Wal-Mart in using its resources, despite their differences in business model and merchandising and promotional strategies.

Costco’s Marketing Efficiency Ratio (MER) of only 0.49 clearly demonstrates its high efficiency in utilizing resources to maintain current market share, by spending less than half of the required amount , whereas Wal-Mart’s MER of 1.05 demonstrates that is spending more than needed to keep its current share of the market.

Finally, following the Maximum Earnings Market Share (MEMS) calculations, the results show that Costco is under-spending (minus 2.79) which is good, but given its CPP lower than its PPP also indicates that it is missing potential earning of \$3.6 billion. Its Maximum Earnings Market Share (MEMS) was at a level of 12.39% share of revenue (SOR) and it had only 9.6% during the period under examination. Wal-Mart, on the other hand, had a positive 51.59 MEMS ratio, which reflects a 26.3 billion in money it could have saved if it had reduced its market share (SOR) from 67.69% to 15.7% during the same period of time. Arguably, it can be very controversial to convince a company or a CEO to actually reduce market share in order to become more efficient and increase earnings, unless these metrics are well calculated and understood.

Chart 6: Costco’s MEMS

Chart 7: Wal-Mart’s MEMS

BIOGRAPHY

Dr. Ramon Corona is a full-time Professor at the School of Business and Management in National University, where he teaches Marketing and Strategy courses. He has a Ph.D. in Education from Universidad Iberoamericana (Tijuana, Mexico) and a Postdoctoral Certificate in Marketing from Tulane University (New Orleans). His main research is in the field of Marketing, specifically in Retail and Hispanic Marketing, and his contact email is rcorona@nu.edu.

TIME EVOLUTION ANALYSIS AND FORECAST OF KEY PERFORMANCE INDICATORS IN A BALANCED SCORECARD

Bernard Morard, University of Geneva
Alexandru Stancu, University of Geneva and IATA
Jeannette Christophe, University of Geneva

ABSTRACT

This paper offers a generic and rational construction of Balanced Scorecard by implementing a time-managed approach to identify the evolution of the main contributors to the current company's strategy as well as their behavior in the future organizational performance. After the optimal structure of the model is generated employing financial and non-financial strategic indicators collected from the organization, the study puts forward a realistic analysis of the evolution in time of the performance metrics. This analysis is based on the Partial Least Square equations behind the Balanced Scorecard proposed methodology, statistically comparable to the Structural Equation Modeling. Using historical data in the final model, it will be noted that an accurate prediction of the performance indicators can be achieved in the Balanced Scorecard tool as the suggested approach establishes the most stable cause-and-effect sequence. Under certain statistic assumptions, this will naturally allow forecasting the effects of future strategic decisions. Although the paper proposes a generic methodology to be applied in any organization, both public or private, commercial or non-profit, this technique will be applied, reinforced and validated with a practical example from a public-owned Swiss electricity company.

KEYWORDS: balanced scorecard, key performance indicators, performance measurement, structural equation modeling (SEM), partial least squares (PLS), principal component analysis (PCA), public organization, energy industry, energetic sector

INTRODUCTION

Numerous authors have criticized the old management systems focusing mainly on financial indicators because of their shortfalls, their retrospective emphasis and incapacity to indicate modern-day value-creating activities. Financial measures are usually regard as 'lagging indicators of performance', because they record the consequence of decisions not when decisions are taken, but rather as the financial effect of these decisions materializes, which can be long after the choice was made (Epstein and Manzoni, 1998). Other critics go much further by sustaining that financial indicators do not increase customer satisfaction, quality, cycle time and employee motivation. Old managements approaches fail to notice the significance of the company's relationship with its environment, and particularly with its customers. Therefore, the necessity is obvious for a series of performance criteria more oriented towards the organization's final goals (Butler et al., 1997).

A novel approach to strategic management was introduced by Robert Kaplan and David Norton in the early 1990s, named the Balanced Scorecard (BSC). Identifying some of the limitations and ambiguities of previous management systems, the BSC method offers a comprehensive guidance as to what organizations should focus on in order to "balance" the financial perspective with other crucial areas. The model facilitates companies to refine their vision and strategy and convert them into action supplying executives with a complete framework that translates the strategic goals of an organization into a consistent set of performance measures. These key measures are regrouped by so-called strategic

perspectives comprising financial indicators and harmonizing them with operational measures that are the drivers of future financial performance, such as customer satisfaction, internal processes and the company's innovation and development activities (Kaplan and Norton, 1992).

One of the main advantages of the BSC and one of the essential distinctions from other methodologies is that the model has the ability to provide managers with a method of articulating a complex chain of cause-and-effect in the company. This pattern grants executives with a base to handle the drivers of wanted results and consequently, the cause-and-effect chain is crucial to the BSC.

However, one of the drawbacks of the BSC lies in its construction. Despite the fact that the two authors offer us several fundamental elements and describe the milestones for building the BSC, the concepts are quite vague and can be difficult to apply in an organizational environment.

There are three main goals in this study. The first objective is to overcome the above limitations and advance several statements for a demonstrative construction of a BSC using the Partial Least Square (PLS) technique. The aim is to generate a realistic model that can be applied in any organization environment. The second objective is to validate the assumptions with a real example from a Swiss organization where performance indicators will outline the strategic perspectives. A cause-and-effect structure will be generated and norms will be set as to which strategic perspectives are influencing the others. One of the main findings of this example is that the Kaplan and Norton's model of BSC is nothing more but a particular case of our conclusions. As the suggested approach establishes the most stable cause-and-effect sequence, the third and final objective is to accurately predict the future changes in performance indicators. Under certain statistic assumptions, this will naturally allow forecasting the effects of future strategic decisions.

The paper is organized as follows. In the next section, we will present and underline the main BSC concepts from the specialized literature. We will highlight the "idealistic" process of 4-axes construction followed by a logical structure allowing for the identification of the number of strategic perspectives as well as the performance indicators connected to each perspective. We will put forward a tentative modeling of BSC that can be implemented in any organization environment. This is pursued by a real example of a Swiss establishment in the energetic sector in which the PLS method is applied in order to build a coherent BSC. Using the structural equations behind the PLS Path Modeling, we will be able to better predict the future company trends and take enhanced corrective measures to quickly adapt in a challenging and complex organizational environment. Finally, we will conclude the paper with the main observations that underline the major outcomes of our work.

LITERATURE REVIEW

According to Kaplan and Norton, the BSC is a management model that allows organizations to identify their vision and strategy and translate into specific actions controlled through a coherent set of actions performance measures. As mentioned by Fielden's (1999), worldwide organizations start on influencing the ability of BSC for translating vision and strategy into measurable objectives. A recent study estimates that 60 percent of Fortune 1000 companies have worked with the BSC (Silk 1998). Adopters include top organizations such as KPMG, Peat Marwick, Allstate Insurance, and AT&T (Chow et al. 1997).

With only four strategic perspectives, the BSC reduces information surplus by forcing executives to focus on the handful of measures that are most essential. The BSC offers managers with the ability to identify performance indicators that could forecast the wealth and health of an establishment. The BSC claims to identify cause-and-effect connections between the various constituents of a company (Kaplan & Norton, 1996). From a practical point of view, this is the core of the BSC, enclosing result metrics and performance drivers, connected together in a cause-and-effect relationship. In fact, the essence of the

model is this hypothesis permitting measurements in non-financial areas to be used to predict future financial performance (Nørreklit, 2000).

However, the BSC also has several limitations with some of its key assumptions and relations underlined by numerous authors from the specialized literature. Nørreklit (2000) argues that there is not a causal but rather a logical connection between the strategic perspectives analyzed. Moreover, the author opposes that customer satisfaction automatically create superior financial outcomes demonstrating that this is not a matter of causality but commonsense since it is incorporated in the concepts. As a result, the BSC makes illogical assumptions, which may lead to the anticipation of incoherent measures, triggering sub-optimal performance. Consequently, a variance must be acknowledged between the strategy articulated in the undertaken actions and the presumed strategy (Nørreklit, 2000).

Kanji (2002) summaries more BSC weaknesses highlighting that the model is excessively abstract and not easy to use it as a measurement model. Furthermore, the links between criteria are not clearly defined and, lastly, the causal relationships are problematic (more like interdependence, rather than correlations).

THE NEED FOR A NEW VALIDATION METHOD

Within this wide-ranging environment of uncertainty and criticism, some authors (Shields, 1997; Shields & Shields, 1998) have called on management accounting researchers to make better use of Structural Equation Modeling (SEM). SEM is a statistical approach comprising a family of different techniques (Path Modeling, Partial Least Squares and latent variable SEM) that allows the simultaneous analysis of a series of structural equations. These techniques are specifically useful when a dependent variable in one equation becomes an independent variable in another equation (Hair et al., 1998).

An important concern to notice is the need of a substantial sample size for the majority of SEM models. A suggested rule of thumb for latent variable SEM is a minimum sample volume of 100 (Medsker et al., 1994). Moreover, it has been recommended that a sample size of 200 may be needed to obtain valid fit measures and to avoid generating erroneous conclusions (Marsh, Balla, & McDonald, 1988; James & James, 1989; Boomsma, 1982; Medsker et al., 1994).

For this reason, management accounting researchers may be restrained from using covariance based methods caused by the significant dataset volumes requirements, and endorse the statement that this technique is suitable in areas where theory is relatively robust. Despite the fact that these limitations are true for latent variable SEM techniques, Partial Least Squares (PLS) modeling presents an appropriate alternative.

Compared to others, PLS regression is a recent technique that generalizes and merges features from both principal component analysis (PCA) and multiple regressions. It is particularly useful when require predicting a series of dependent variables from a (very) large sequence of independent variables (i.e., predictors). The “PLS approach” concept is somewhat too large and combines PLS for path models on one side and PLS regression on the other. Following a suggestion by Martens (1989), this paper uses the term PLS for Structural Equation Modeling to designate the use of “PLS Path Modeling” as illustrated in Figure 1.

Relations between the observed variables and the latent variables (outer model)

Each latent variable ξ_j is implicitly explained by a set of observed variables x_{jh} . Each observed variable is connected to its latent variable by a simple regression:

$$x_{jh} = \pi_{jh0} + \pi_{jh}\xi_j + \varepsilon_{jh} \tag{1}$$

Relation between the latent variables (inner model)

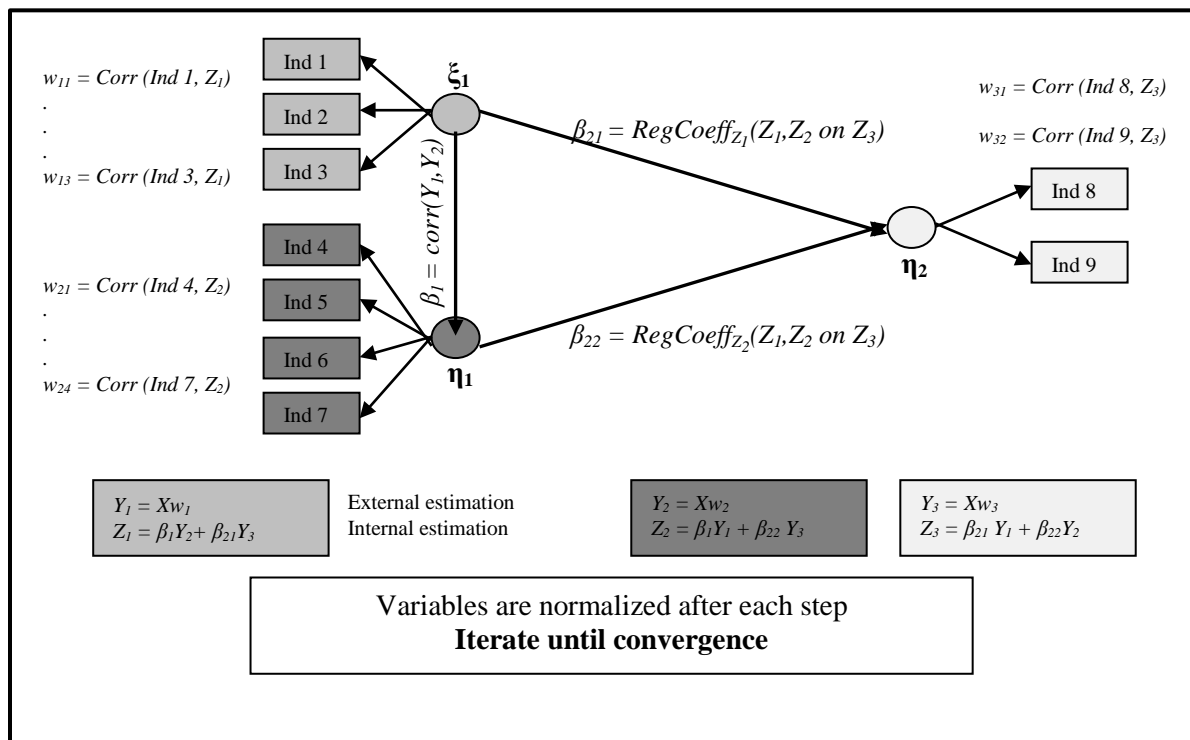

The causality model leads to linear equations linking the latent variables:

$$\xi_j = \beta_{j0} + \sum_i \beta_{ji}\xi_i + v_j \tag{2}$$

The latent variables connected to ξ_j are segregated into two categories: the predecessors of ξ_j which are latent variables impacting ξ_j and the successors which are latent variables impacted by ξ_j . For any predecessor ξ_i of the latent variable ξ_j , the inner weight e_{ji} is equivalent to the regression coefficient of Y_i in the multiple regression of Y_j on all the Y_i 's connected to the predecessors of ξ_j . If ξ_i is a successor of ξ_j then the inner weights e_{ji} is equivalent to the correlation between Y_i and Y_j (Tenenhaus & Vinzi, 2004).

The available software has been for many years LVPLS 1.8 developed by Lohmöller (1987, last existing version). More recently, Wynne Chin has developed a user-friendly PLS Path Modeling software labeled PLS-Graph 3.0 (2001, for the last version) and Christian Ringle added more statistical tools for a comprehensive validation of the PLS model in his software entitled SmartPLS. Besides the user-friendly graphical interface to PLS Path Modeling, the algorithm has been further refined and improved with major capabilities, like cross-validation of the path model parameters using jack-knife and bootstrap amongst others.

Figure 1: Example of PLS Path Modeling

Above figure describe the two key relations found in any PLS path model: a first one named the outer model, illustrating the connections between the latent variable and its manifest variables and a second one called the inner model defining the relationships among the latent variables themselves.

Bootstrapping is the method of determining components of an estimator (for example its variance) by computing those aspects when sampling from an estimating distribution. One usual option for computing distribution is the observed distribution of the empirical variables. In the situation where a group of observed variables are assumed to be from an identically and independent distributed population, this can be solved by generating a number of resamples of the observations (and of same size of the observations), each of which is achieved by random sampling with replacement from the initial set of data.

Nevertheless, even if newer and more complex PLS programs are available today (e.g. PLS-Graph or SmartPLS), a better analysis of the PLS Path Modeling allowed us to develop our own software from scratch. The goal was to combine all statistical techniques we are using in one single and reliable tool: compute the principal component analysis (PCA), estimate the path weighting scheme and, finally, generate bootstrap validation procedure and evaluate the best from all possible graphs.

LINKING BALANCED SCORECARD WITH PARTIAL LEAST SQUARES

Ittner and Larckner affirmed in 1998 that "(...) decisions using multicriteria performance measurement systems should be computed using explicit, objective formula that prescribes the weights to be attached to each measure, or should be based on subjective evaluations where the weights to be attached to each measure is implicitly or explicitly chosen by the decision maker". This should always be taken into account when building, checking and validating assumptions of causality relations between performance indicators in the context of the BSC implementation. While this might seem difficult from a practical perspective, the PLS technique offers a suitable solution.

As shown in Figure 2, the initial statements of causality relations between the four strategic perspectives remain subjective in the Kaplan and Norton's BSC. The use of the PLS Path Modeling will establish, in a more objective way, the intensity of the relationships between the strategic perspectives defined by their key performance indicators.

Figure 2: Generic relationship map in a BSC (Kaplan and Norton, 1996)

This figure illustrates the original cause-and-effect pattern in a BSC as defined by the Kaplan and Norton (1996), starting from the learning and growth perspective that will affect the measures of internal business processes which sequentially will influence the measures of the customer perspective which, finally, will affect the financial area.

In a structural equations approach, the latent variables require measurable variables, which are described through performance indicators that can be directly observed and evaluated. The structural equations method is derived from the principal component analysis of the data (confirmatory or exploratory, in line with each specific case) to identify and validate the model of the causal relations which represent the focal point of BSC. It is essential to stress that one of the intrinsic limitations in the use of structural equations in the BSC framework are the prerequisites for the data validation, which demands a significant

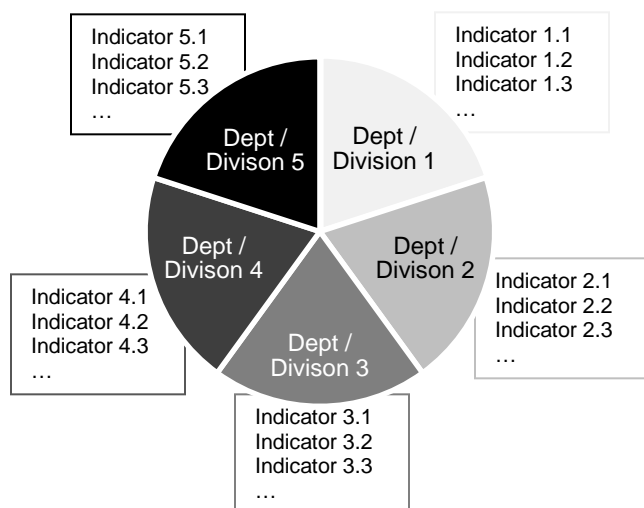

quantity of observations in order to validate the final results. This is one of the reasons why the PLS technique presents an important advantage in any case where large datasets are not available.

A PRAGMATIC CASE: Example of a public-owned Swiss organization

The proposed approach, although universally appropriate to any type of organization, is portrayed using an example of a public-owned Swiss electricity institution. Based in western part of Switzerland, this governmental organization has active involvement in various electricity projects, especially those concerning to new sources of renewable energy. The core mission of the company is to establish a strong renewable electricity platform in western part of Switzerland.

In brief, there are five consecutive steps proposed in this paper, at the end of which will allow the construction and implementation of a rational and optimal BSC: (1) collect historical data from the company, (2) sort out and prepare the final database, (3) determine and identify the numbers of strategic perspectives and performance indicators connected to former, (4) construct the cause-and-effect link between all strategic perspectives and, lastly, (5) operate this management tool for long-term planning.

Figure 3: Identifying and collecting company's performance indicators

Above figure shows an example of an organization with its various departments or divisions. After a careful analysis all performance measures will need to be identified and subtracted with the help of the main business owners.

As displayed in Figure 3, the first step is related to the collection of all historic key performance metrics throughout the company. This first step is fundamental and will greatly influence the following steps. Although this appears a simple task, it actually involves a massive time assembling the measures employed in the organization, especially building a valid historic database. Applying this step in our Swiss example resulted in a total of 144 variables summarizing their evolution over 24 periods on a monthly basis (2 years).

Considering the significant number of indicators, the second step is associated to a final cleaning of the database (Table 1). As mentioned in previous step, the database preparation is essential as the collected metrics could contain errors and might potentially pollute the findings. Accordingly, the variables should be characterized by (a) reliability and consistency, (b) same incidence in time, (c) ability to capture a fraction of the organizational strategy, (d) information singularity and (e) clarity and straightforwardness. This second step is realized through consistent analysis and intense top management discussions and will

ensure that the retained variables are the essential drivers for the company. Following this step only 64 key performance indicators have finally been kept.

Table 1: Example of database final preparation and cleaning

Strategic performance indicators database					
Time series	Ind 1.1	Ind 1.2	Ind 1.3	...	Ind zz.yy
Month 1	X	X	X		X
Month 2	X	X	X		X
Month 3	X	X	XXX		X
...		X	X		X
Month n		X	X		X

Missing variables
Unreliable variable

This table exemplifies the cleaning of the database, where one performance indicator contains several missing values and another one that have unreliable data (e.g. due to a change in the measurement or the re-definition of the variable). These kinds of indicators should either be corrected (if possible) or, otherwise, completely excluded from the final database.

Nevertheless, although this rational managerial selection has been engaged, the organization continues to have a large KPI database, which is quite difficult to manage in the BSC construction process. As showed in Figure 4, **the third main step** is to filter and assemble the variables within specific axes (or strategic perspectives) able to summarize a part of the company's performance.

Figure 4: Filtering the performance indicators per strategic perspectives

Above figure illustrates the three main achievements in performing this third step: 1) generate the number of strategic axes (example shows 3 perspectives), 2) filter and retain only the performance indicators that are highly correlated (illustrated by the circles seizing only the relevant variables) and 3) label the groups of indicators by analyzing the information that gravitates each strategic perspective (for the sake of clarity the perspective names have been kept as 1st, 2nd and 3rd axis).

There are three main achievements in performing this step: first is to generate the number of strategic axes encapsulating an suitable level of the total organization's performance, second is to filter each axis and keep only the key measures that are highly correlated, disregarding any redundant and inappropriate

information and, third is to tag these groups of indicators by examining the nature of information that gravitates each strategic perspective.

Both factor analysis and principal component analysis (PCA) can be used for this step. However, the PCA suits better our study requirement, as it is fitting for a non-predefined experimental model, while factor analysis is righter for models that have a standard beforehand. As the statistical method employed (e.g. PCA) is processing historical data, the results of the actual research will consequently be dependent on the data available at the time of compendium. However, the intention of our study is not to develop the best indicators, which sometimes could be driven from subjectivity and personal preference, but to actually highlight the importance of the measures available.

Conducting this step in the Swiss company example over the whole 64 performance indicators, one can clearly notice that with five components, approximately 67% of the total organizational variance is explained (Table 2).

Table 2: Extract of Total Variance Explained

Component	% of Variance	Cumulative %
1	23.4	23.4
2	14.6	38.0
3	12.7	50.7
4	9.3	60.0
5	6.6	66.6
6	4.8	71.5

This table shows the extract of the first six components cumulating a total of 71.5% of the organization's variance. However, with only five components (grey highlighted line) and a total variance explained of 66.6% it is assumed to be sufficient to extrapolate to the total variance of the company.

The same PCA also provides the influence of the variables (indicators) against each of these five axes with the help of the component matrix determining the correlation of all variables with each of these axes. Table 3 illustrates the correlation of the first 10 normalized variables with each axis. The nearer a correlation is to zero, the less the corresponding variable affects the axis. Finally, the variables will be ordered and filtered with respect to the correlation it has upon the axes.

The first 10-15 performance measures per axis are preferred for selection, ordered in function of their correlation with the axis. However, even though statistically speaking the highest ranked measures are strongly correlated to the respective axis, one still needs to do a rigorous analysis of the data and remove and/or replace those indicators that would not effectively support the definition of the perspective. While this procedure it is not mathematically corroborated, it is mainly primarily intended to clear out certain metrics that would violate the definition of the axis. In any economic environment (which by definition is uncertain), it is inappropriate to consider that all indicators correlated to the perspective in cause are also fully representative from a strategic point of view.

At the end of this third step, the organizational strategy from our chosen Swiss example was recognized to gravitate along five main perspectives: Finance Perspective, Internal Processes Perspective, Development and Growth Perspective, Support Perspective and, finally, the Quality Perspective each of them comprising 4 to 5 explanatory variables as explained in the next step.

The fourth major step in determining the current strategy of the organization is to apply a PLS Path Modeling regression on the final strategic perspectives. To determine the most sustainable cause-and-

effect chain between the perspectives, all possible valid connections between these axes should be analyzed. The most stable PLS model from all possible combinations is considered the closest to the company's actuals strategy. The stability of the PLS model is determined with a bootstrap technique on each possible graph.

Applying this step to the specific Swiss example of this study, all possible valid connections between the five axes were analyzed, that is to say a total number of 52'720 possibilities. This step has been achieved using our educational software (PLS Assistant) that was developed and programmed from scratch based on PLS algorithms. Represented in Figure 6, the software is capable of selecting the most stable PLS graph from all valid arrangements.

Table 3: Extract of the First 10 Indicators from Component Matrix (normalized)

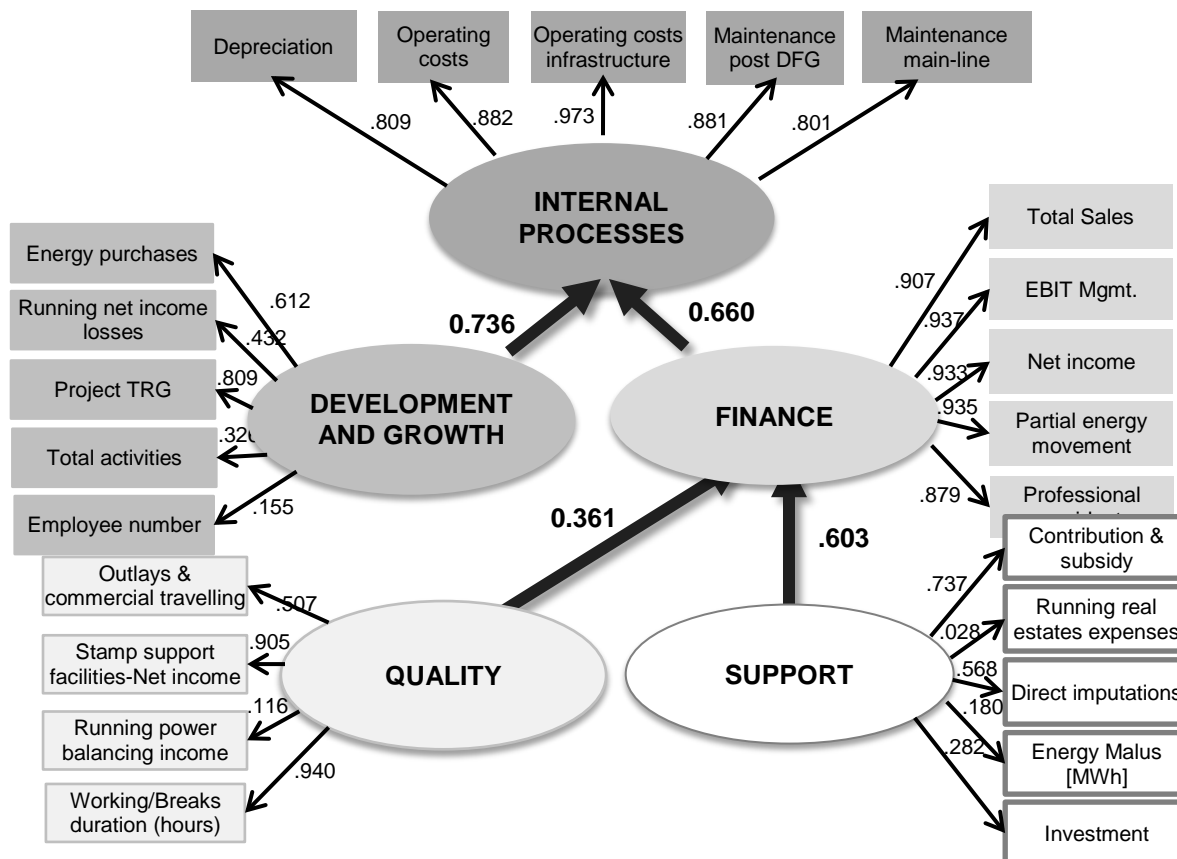

VAR no.	VAR name	1 st axis	2 nd axis	3 rd axis	4 th axis	5 th axis
VAR001	Chiffre d'affaires net	.835	.031	-.310	.145	-.273
VAR002	Chiffre d'affaires interne	-.297	.517	.376	-.185	-.223
VAR003	Achats d'énergie	.384	.000	.571	-.472	.345
VAR004	Résultat mouvements d'énergie (partiel)	.932	.132	.064	-.134	-.133
VAR005	Autres produits d'exploitation	.439	-.622	.227	.232	-.180
VAR006	Prestations activées	.280	.246	-.611	.187	.397
VAR007	Prestations internes (produit)	.170	-.063	-.673	-.150	-.188
VAR008	Produits d'exploitation	.496	-.583	.026	.229	-.150
VAR009	Matériel & prestation	-.455	.629	-.063	.244	.029
VAR010	Charges de personnel	-.573	-.101	.350	-.010	.081

This table displays an extract of the first 10 performance indicators (out of the total 64 from the final database) with their respective correlation with each of the five components (or axis).

This assembly is the optimal structure of connection between the five axes and turns out to be more realistic than any other model - the closest to the actual organizational strategic vision. Contrary to Kaplan and Norton's BSC model, it was straightforward that this Swiss electricity company was not expected to have the angular stone characterized by the finance perspective. In fact, the company is an old and unhealthy institution lead by structural issues, with obsolete and inefficient equipment that constantly erodes its competitive strength. The lead-management had to take some strategic decisions recently with the intention of restructuring their internal processes, by focusing on the financial and human aspects.

The finance perspective appears logically in this present strategy as a secondary (and hopefully temporary) objective. The financial indicators are strongly correlated with their axis, confirming their indirect contribution to improve internal processes. In a similar purpose, efforts are made in this Swiss institution to improve the quality of their services, but model tend to show in contrast that the support perspective has more impact on the financial axis.

Figure 6: BSC's cause-and-effect chain using PLS approach

Above illustration represents the optimal structure of connection between the four strategic perspective and turns out to be the closest to the actual strategy of the organization. This final assembly has been selected from all possible connections using the bootstrap technique, being the most stable PLS graph.

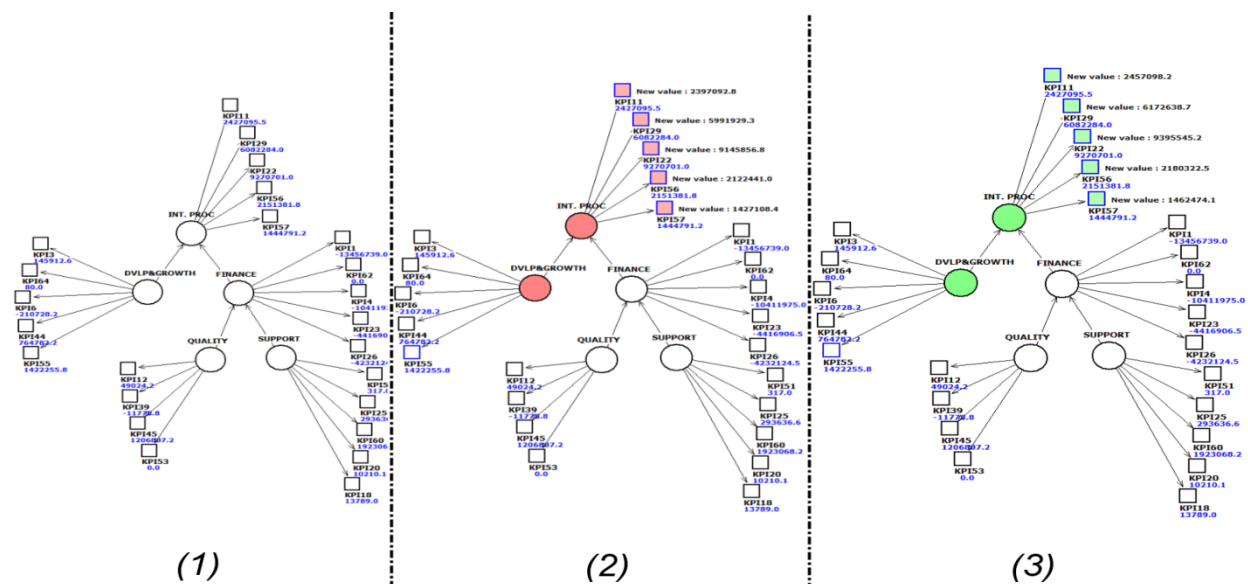

As noted in the beginning of this study, the inner and outer relations are founded on structural equations. Consequently, at the back of each PLS Path model are equations that explain the relationships between indicators and the corresponding axis (outer model equations) and between the axes or strategic perspectives themselves (inner model equations). The fifth major step is based on using these equations in order to study and predict the relations for the long term.

In a management-controlling field centered on strategic decisions, it is obviously appealing for the organizations to use Partial Least Square in order to simulate and measure impacts of strategic indicator variations over the rest of the model. With this kind of a tool, the manager can forecast the behavior of his current strategy, sorting the potential future of his organization into a couple of scenarios with the possibility to study the impact of each of them over the rest of the structure. PLS is generally referred to as a "prediction oriented approach" (Sellin, 1995) statistically outperforming simple benchmark models (Cengiz & Herwartz, 2009).

The model found by bootstrapping comparison has good quality scores to be a relevant model and to forecast variation of indicators. It should be noted that this variation needs to be rather small, otherwise the whole model weighing/loadings would lose too much consistency to be faithfully used. In addition, as any statistical tool used, the prediction model should be considered more as trends rather than exactly future relevant values.

Using the PLS equations, a “simulation view” has been implemented in our PLS Assistant software in order for the manager to test the impact an indicator modification can have on the overall model. This exclusive feature now freely allows managers to forecast different scenarios.

Figure 7: PLS Assistant 2.1 simulation UI presentations (1), No of employees change: Impact of different scenarios study (2&3)

However, one should keep in mind that any company takes time in order to recalibrate from any change or crisis situation. Any change in the organization’s strategy should be completed in a pondered and controlled way. Furthermore, it should be noted that a public detained organization cannot be revolutionized or radically transformed as a private-owned company might be. The example used in this study refers to an electricity institution that has strong connections with the local public authorities, thus her status is borderline between these two concepts.

CONCLUDING COMMENTS

The research goal of this study was to develop and empirically validate a comprehensive framework that bridges Balanced Scorecard model with Structural Equation Modeling approach and endorses a modern understanding of aspects underlying the actual strategy, with the intent of better manage and control the corporate performance.

The fundamental step towards this objective was the development of a general frame of reference that harmonized previously contradictory theoretical assumptions associated with the Balanced Scorecard as well as with its ease of implementation. On this basis, the suggested framework is embracing several main concepts:

1. tackles the issues of strategic vision of any company and converts the current strategy into an easy-to-use model for better integration, communication and long-term management;
2. highlights the key performance indicators that have the capability to capture the most relevant information from the organization, information that is strongly linked to the actual goals the company is aiming for;
3. assembles distinctive strategic perspectives that summarizes organizational information in an appropriate way, in order to create a thorough illustration driving institutions on their road to success;

4. establishes the relations between strategic perspectives in a cause-and-effect chain that underlines the interactions taking place at a strategic level, helping in emphasizing the organization's advantages and weaknesses;
5. overcomes the static aspect of prior models disclosing the dynamic evolution over time by employing mathematical PLS equations, refining the planning and control of the main components within a company.

Having established the strategic research framework, we empirically validate the proposed methodology by developing a strategic map in the context of a Swiss electricity organization. The results obtained suggested that the BSC issues could be formalized in a more rigorous manner. It is thus possible to reconsider the notions advanced by Kaplan and Norton as showed in the analysis of this case.

The application of PLS Path Modeling converts the current strategy into a cause-and-effect model that can be monitored and controlled using a handful of main performance indicators. One might argue that by handling historical data, the model summarizes outdated information by illustrating a picture that cannot be exploited to predict future planning. While this assumption is legitimate, the methodology is actually identifying the current strategy applied by the institution. Only by fully recognition of the actual situation one can plan for the period to come. As proposed in this study, the PLS regression is more suitable for maximizing prediction, thus the model is also capable of revealing the forecast strategy of the company. In addition, this approach permits the simulation of the resource allocation impact on the organization's overall performance. Finally, it should be noted that these managerial tools are applied in a moment of a major need for strategic change in the company. The use of this approach acknowledges not only the recognition of the chain of causality between different strategic areas of the corporation's performance, but also reinforces the intuition with "a measure of the measures".

The Partial Least Square (PLS) technique will likely grow in usage in the coming period, as it is significantly less difficult to understand than the covariance-based methods when it comes to identifying a model and explaining of results. However, disadvantages of PLS contain higher complexity of explaining the loadings of the independent latent variables and since the distributional characteristics of estimates are not recognized, the researcher cannot assess model significance with the exception of bootstrap induction. Additionally, being quite a new statistical technique, there are few commonly agreed thresholds for the model validity and stability. Nevertheless, we have used the small number of tools available for PLS Path Modeling approach, tools frequently employed in other PLS studies found in the specialized literature.

To conclude, we believe that it is relevant to develop a more formal methodology in order to validate the organization's strategy in a rational way, while using a simplified model. Indeed the PLS method suffers from a deficiency of theoretical foundation. Similarly, Kaplan and Norton's approach was strongly criticized in the specialized literature from this perspective as well. The difficulty with which future researchers will be challenged lies in the compromise between the pragmatism required by the corporations and the need for the theoretical framework requested by researchers.

BIOGRAPHY

Bernard Morard is a double PhD in both Finance and Accounting and currently a full professor in Management Accounting at the University of Geneva, Switzerland. He is the author of numerous publications in Management Accounting and various financial studies in the specialized literature. He can be reached at University of Geneva, 40 Bld. de Pont d'Arve, 1205 Geneva, Switzerland, bernard.morard@unige.ch.

Alexandru Stancu is a PhD in Management Accounting at University of Geneva and is currently working in IATA (International Air Transport Association) in Corporate Planning and Control department. His PhD thesis focuses on the Balanced Scorecard concept and identifies new ways in building a rational management tool, by implementing statistical methods like principal component analysis (PCA) and partial least squares (PLS). He is the author of several publications in the field of Management Accounting. He can be reached at IATA, 33 Rte. de l'Aéroport, 1215 Geneva, Switzerland, stancua@iata.org.

Christophe Jeannette is currently a Teaching and Research Assistant in Management Accounting. He is in process of finalizing his PhD thesis identifying and establishing patterns for company's failure and bankruptcy processes. He is also the full developer of PLS software (PLS Assistant) that enabled many in-house studies and researches to be analyzed and finalized. He can be reached at University of Geneva, 40 Bld. de Pont d'Arve, 1205 Geneva, Switzerland, christophe.jeannette@un

CANADIAN MINING AND CORPORATE SOCIAL RESPONSIBILITY: ADVANCING CORPORATE INTEREST AND COMMUNITY ENGAGEMENT

Mark Weaver, Sheridan College

ABSTRACT

Stakeholder theory has been used to justify the expansion of the term Corporate Social Responsibility (CSR) to encompass a broad social justice and sustainable development agenda. Canadian mining companies understand the legacy created by their industry. They are aware of the need to operate with social, cultural and environmental awareness and sensitivity toward constituencies impacted by their projects. However, this progressive interpretation of CSR is unwelcomed by the mining industry. It does not accept the premise that they are responsible for resolving community frustrations resulting from failed or absent government policies in order to legitimize its right to operate. Nor do some communities want mining companies to carry these burdens. The contribution made by this study is in re-framing the corporate-community relationship within the context of a social contract. It provides an understanding of how some mining companies develop and maintain successful operations with the support of the community and to the benefit of corporate interest. This study analyzes two, unrelated, Canadian, exchange-traded, companies operating in the same Mexican jurisdiction. The fact that these companies were not threatened or petitioned by activists or NGOs and did not collude or leverage the support of the government against the community, speaks to the possibility that successful CSR practices do not have to be activist, NGO, or government agency-driven.

KEYWORDS: Canadian Mining, Corporate Social Responsibility, Government policy, Sustainable Development, Stakeholder Theory, Social Contract Theory

INTRODUCTION

Few issues are as important to the Canadian mining industry as Corporate Social Responsibility (CSR). Canadian mining companies represent 75% of mining activity worldwide. Historically, they have invested nearly 60 billion dollars in over 10,000 exploration and development projects around the world. Since they operate with demanding social, cultural and environmental constraints and sensitivities, Canadian mining companies are expected to adhere to CSR standards which “align mining activity with the priorities and values of its communities of interest” (MAC, 2012). The Mining Association of Canada (MAC) defines communities of interest as “all individuals or groups who have or believe they have an interest in the management of decisions about our operations that may affect them...this includes employees, contractors, aboriginals or indigenous peoples, mining community members, suppliers, customers, environmental organizations, governments, the financial community and shareholders” (MAC, 2004). In this way, stakeholder-based business policies such as CSR can inform and frame company-community relationships (Jenkins, 2004).

However, value creation by mining companies remains unevenly distributed today. Mining companies can operate abroad with significant profit. Country-owed royalties, taxes, working conditions, wages, and safety standards are typically low. Many mining projects around the world are operated with a well-documented social and environmental cost (Kapelus, 2002; Jenkins, 2004). Since 1999, Canadian mining companies were involved in more than four times as many incidents as their foreign competitors...60% of which were attributed to community conflicts and 40% involved environmental containment or

degradation” (CSR Movements and Footprints, p.10). Part of the problem is that CSR standards in this industry are self-regulated. They clearly vary in kind and in degree from project to project, by jurisdiction, orientation, and by definition. At their root, however, are basic assumptions about how businesses are expected to contribute to society. This study observes that it is possible the encompassing nature of the stakeholder approach has limited governmental ability to legislate CSR behaviours and increased the difficulty in managing community-based expectations. Through its analysis of two publicly-traded, Canadian, mid-tier mining operators, this research infers that idiosyncratic CSR policies may be better explained in terms of a social contract framework.

Research Aim

Kakabadse et al (2005) highlights 17 different definitions of CSR distinguished by degrees of legal compliance, philanthropy, and voluntarism. This is in addition to “upwards of 50 global and domestic guidelines by which companies can measure their social responsibility efforts” (Fraser, 2005, p.45). There is no shortage of facilitators, conferences, and interested parties willing to engage in discussion about how CSR might best be applied in the mining industry. There is virtually no limit to the range of corporate activities done by mining communities under the banner of CSR such as basic regulatory compliance, environmental rehabilitation, social action, health care, providing fresh water, building roads, addressing educational needs, and supporting local charitable interests. The irony is that while the importance of CSR is widely acknowledged, there is no uniformity regarding what it means to do it or how it should best be done; no requirement to ensure all companies do it; and no statutory enforcement agencies to ensure it gets done (Carroll, 1991, Kakabadse et al (2005). This study does not criticize industry, activist, or government agencies or their mandates and behaviours. In its attempt to understand better how and why CSR principles and policies are applied by this segment of the mining industry, it offers the following proposals.

Proposition 1: It is plausible to infer that social contract rather than stakeholder entitlement might provide a better explanation of corporate-community engagement.

Proposition 2: Using the social contract framework, it can be suggested that Canadian mining companies are prepared to promote better CSR standards irrespective of NGO and governmental scrutiny.

LITERATURE REVIEW

The traditional criticism of stakeholder theory is based on shareholder interest. Regardless of whether shareholder interest is defined in Friedman’s terms of economic self-interest (1970) or in terms of Jensen’s theory of enlightened self-interest (Carroll, 1999), the hypothesis remains essentially the same. Companies can best align their interest with society when they hire employees, pay appropriate wages, pay taxes, make a profit, and then reinvest that profit in activities supporting the long-term goals of the company. The degree to which this may be true is still debated and well-documented elsewhere (Carroll, 1999, Auld et al. 2008). In contrast, this study focuses on operational challenges raised by stakeholder theory because, currently, stakeholder theory “has become inescapable if one wants to discuss and analyze CSR” (Branco and Rodrigues, 2007, p.5). This connection is particularly important in mining. The roots of stakeholder theory, and by extension CSR, can be traced back to the beginning of the Industrial Revolution where activists and politicians of the day debated the impact of profit on the commoditization of society. After the conclusion of the Second World War, scholars and practitioners began to reframe this debate in the context of strategic management. The applications they had in mind related to leading mass marketers, producers, and distributors of the day: companies which were customer facing. The mining industry did not pay any attention to CSR at this time or in the decades that followed. For the most part, its operations were located in remote areas of the wilderness, its customers were at a distance, and its products were not easy to substitute. Canadian mining companies were motivated to take

CSR seriously only after the 1992 Rio Conference focused significant global attention on several high profile environmental disasters and recommended new levels of environmental protection. In Canada, that energy was merged with rising tension over native sovereignty evidenced in contentious land claim settlements with the government as natives then assumed the power to negotiate directly with extraction-based companies wanting access to their lands and its mineral wealth (Jenkins, 2004, PDAC, 2009).

Scholars such as Key challenge stakeholder theory based on the way it describes rather than connects the different levels at which an organization might engage its communities of interest (Key, 1999). Clarkson (1995) argues the inevitability of being forced to differentiate between primary and secondary stakeholders and in doing so disenfranchise stakeholders whose interest in a management decision might not be immediately significant or, in the sense of residual environment rights, might not be understood. This suggests the stakeholder approach is more of a strategic construct than a theory. However, from the point of view of this study, it is the underlying assumption of the stakeholder approach which is of concern: companies engage in CSR in order to earn a social license which builds brand loyalty, extends market penetration, and ultimately allows companies to reap benefits which increase shareholder value (Carroll, 1999; Branco and Rodrigues, 2007; Husted and Allen, 2009). This study develops Moir's proposition that it is not the business case for CSR that drives business policy but the nature of corporate-community engagement "that forces a company to understand its capabilities and limitations in a way that reflects the needs of society" (Moir, 2001, p.10). This understanding forms a social contract in that it creates a consensus between the company and its community allowing the expectations of both parties to be managed. CSR expresses the contract. Case studies raised by Kapelus (2002) and Imbun (2007) provide an existential basis for this observation. Commenting on the challenges of unilateral action, Kapelus quoted a representative of Anglo-American as saying, "mines and their communities are confronting together, in a spirit of common purpose and resolve, many of the country's critical challenges (Kapelus, 2002, p.287). Imbun wrote that in managing Papua New Guinea mines, "two things are evident...local communities exert pressure on mines to deliver projects, and mines positively acknowledge the demands of their host areas (Imbun, 2007 p.190).

This discussion also extends the work of Dashwood (2007) who studied the adoption of CSR by two large-capitalized, publicly-traded, Canadian mining companies, Placer Dome (now Barrick Gold) and Noranda (now Xstrata). Dashwood acknowledged that the rationale behind CSR is deeply rooted in the historical interaction between business and society but much of its inertia is tied to the events of the last thirty years. In the case of these two multinational mining companies, Dashwood concluded that the global CSR agenda was important "but not so important as to provide a sufficient explanation for the CSR policies of Placer Dome and Noranda" (Dashwood, 2007, p.130). The key to embedding CSR into business practice rested primarily in the managerial reaction to two domestic issues: native self-government and changing environmental demands (Jenkins, 2004; Dashwood, 2007; PDAC, 2009).

This study also builds on the work of Weyzig (2006) and Husted and Allen (2009). Their research confirms Dashwood's conclusion that the "global dimension" of CSR has raised the profile of CSR, but its effect is normative in Mexico (Weyzig, 2006, p.69). The difficulty of managing CSR practices is compounded by socio-economic development. Expectations "in emerging economies differ from those in high-income economies" (Weyzig, 2006, p.69). Rather than capacity building, in Mexico, the over-riding concern is with poverty. Solutions are sought at the local level. At the top of the CSR agenda are fair wages, social responsible investing, and corporate philanthropy (Weyzig, 2006).

DATA AND METHODOLOGY

This study was challenged by the fact that activities involving mid-tier mining companies are under-researched. Where information is available, it mostly concerns listing and governance issues. Stock exchanges do not require exchange-traded companies to disclose anything related to political, social or

environmental concerns except when this information becomes material and unevenly felt by peers such as in the publication of a 43-101 resource estimate or a pre-feasibility or feasibility study (TMX, policy 3.6, 2010). The voluntary aspects of CSR tend to be low-intensity and small-scale event. They are not generally part of industry-based communications which are technical and operational in character. There are no comprehensive, bench-marking academic studies, industry, or NGO databases available which establish the scope and contributive value of CSR by the Canadian mining industry or this segment of it. Having said that, a study was published by The Canadian Centre For The Study of Resource Conflict (CCSRC) with support from the Prospectors and Developers Association of Canada (PDAC) in 2009. This study noted that “171 high profile incidents” were reported publicly, primarily by NGOs and human rights groups since 1999 (CSR Movements and Footprints, p.6). Approximately 62% of these incidents involved some kind of human rights or environmental-based concern 79% of which pertained to mining operations (CSR Movements and Footprints, p.8). Of the 48 countries in which these violations occurred, 32% were attributed to Mexico and areas of Latin America (CSR Movements and Footprints, p.9). “Canadian mining companies were involved in more than four times as many incidents as their foreign competitors...60% of which were attributed to community conflicts and 40% involved environmental containment or degradation” (CSR Movements and Footprints, p.10). These statistics leave out a lot of vital information such as the nature of the community conflicts or degree of environmental containment, how these incident rates might compare to domestic-led mining operations in number or severity, and connections between these incidents and CSR practices.

To pierce the CSR veil, this study utilized a qualitative approach consisting of a combination of company-based interviews and mine site-community visits which took place in Mexico from the summer of 2011 through the spring of 2012. Investigative efforts were focused on Mexico because it has an established mining tradition dating back to the 1500s. It has a fairly stable process around the establishment of property and residual rights as well as surface and mineral rights thanks in part to the co-operative movement which began almost eighty years ago. Its environmental legislation is similar in scope to that in Canada. It has more Canadian companies engaged in exploration and development projects there than in Latin America. Activism and NGO activity is widespread in Mexico. This study chose to focus on two companies operating within a few miles of each other in the same Mexican jurisdiction, drawing on a similar labour pool, where one of which was singled out by an NGO for CSR violations many years ago and the other was recognized by the Mexican Centre for Philanthropy for its community initiatives.

RESULTS AND DISCUSSION

The companies observed in this study are Endeavour Silver Corporation and Great Panther Silver Limited. They are headquartered in Vancouver, Canada. They have operated projects in Guanajuato, Mexico since 2005. Both of these companies have established CSR policies and procedures which are implemented on a consistent company-wide basis. Despite the fact they operate projects in the same jurisdiction, their CSR policies differ from each other.

The first question addressed to these companies by the researcher concerned where they stood on the shareholder-stakeholder debate since this provides a foundation for CSR policy in Canada. MAC's CSR framework, cited earlier, is virtually identical to that of Freeman (1984). It was developed over several years in consultation with the Canadian government, international organizations, community groups, academics, NGOs, and Canadian mining companies, and continues to be reviewed by representatives of these groups (MAC, 2012 b). Its intent was to encourage widespread adoption of strong corporate and public policies and to ensure its 1000+ corporate members comply with these policies as a condition of membership. Performance audits are a mandatory part of this compliance (MAC, 2012 b). In contrast, the other association representing Canadian mining companies is the Prospector's and Developer's Association. PDAC's approach to CSR is embodied in a template titled *e3: Environmental Excellence in Exploration*. PDAC uses a lot of the same terminology as MAC but is not as inclusive. While PDAC

consults with the Canadian government and certain NGOs, it uses the term “stakeholder” in the “enlightened” sense by generally referring mining companies (Jensen 2001). The majority of its recommendations around CSR specifically represent company interests. Relying on moral suasion, its membership is not required to adopt these CSR recommendations except on a volunteer-basis. According to The CCSRC, 78% of publicly listed companies in this sector have voluntarily adopted CSR to some degree (CSR Movements and Footprints, 2009).

Endeavour and Great Panther were asked about the degree to which interactions with government and NGOs shaped their approaches to CSR. They answered that it had informed their policies but not shaped them (Walton, 2011; Bertsch, 2012). This confirms Dashwood’s point that, as norms filter down from the global to the national level, companies have a chance to shape them from the bottom-up. In the case of Placer Dome and Noranda, they were able to impact the environmental language adopted by the International Council on Metals and the Environment (Dashwood, 2007). Within a couple of years, widespread consultations, Roundtables, were held across the industry and with external interests including the Canadian government as part of an exercise that was expected to lead to the introduction of legislation on CSR accountability. The Canadian government failed to pass this legislation three times due in part to intense lobbying from the mining industry. With the failure of the third bill (Bill C-300), MAC and PDAC focused their efforts on bolstering member interest in CSR through conferences, workshops, and consultation based on their respective flagship projects TSM and e3. Neither Endeavour or Great Panther actually used or consulted TSM or e3 as part of their CSR initiatives (Walton, 2011, Bertsch, 2012).

The failure of Bill C-300 was not the only initiative the Canadian government was involved with regarding CSR and the mining industry. Following the 2007 Roundtable, the government introduced its CSR guidelines mirroring those defined by the Organization for Economic Cooperation and Development (Department of Foreign Affairs and International Trade, 2008). It developed marketing material on CSR themes, set aside a \$170,000 budget specifically for CSR activities, and committed relevant agencies such as the Canadian International Development Agency (CIDA) and the Canadian Investment Fund (IFC) to support CSR initiatives in the developing world. It also created a cabinet-level position, Extractive Sector CSR Counsellor, to act as an ombudsman to mediate CSR-related disputes between companies and community interests domestic and abroad (Department of Foreign Affairs and International Trade, 2008). Both Endeavour and Great Panther commented on the irrelevance of this budget amount and that they rarely see Canadian officials involved in mining concerns unless there is a serious problem such as in the recent case of Blackfire (Walton, 2011; Bertsch, 2012). The contribution of the CSR Counsellor was equally suspect. It was designed as a force for mediation between the mining industry and foreign communities of interest, and it has not successfully resolved any dispute brought before it.

The NGO experience was different for Endeavour and Great Panther. Most foreign-based NGOs operating in Mexico do so south of Guanajuato where Endeavour and Great Panther’s Mexican operations are based. In the case of Endeavour, it became a footnote in MiningWatch Canada’s report titled *Canadian Mining in Mexico: Made In Canada Violence* because Endeavour had irritated a local landowner. Endeavour admitted that, in its early exploration efforts, it had crossed land without an owner’s consent despite efforts to locate the landowner and an official complaint was filed (Walton, interview, 2012). This is the most common form of corporate-community conflict which can arise. It is one of the easiest to resolve. Since that time, Endeavour put its Mexican mines into operation, substantially expanding those operations, managed key water and waste processes protecting the environment and needs of the community, and is on target to produce 4.3 million ounces of silver this year. Yet, this trespassing incident is still noted on the MiningWatch website. In the last seven years, no other complaint has been raised about Endeavour and none against Great Panther.

To the question of what constituted CSR practices in their respective companies, Endeavour and Great Panther both pride themselves on bringing to Mexico the very best of Canadian standards in health and

safety practices and environmental compliance. Both companies commented on how their attention to safety, daily safety lectures, drills and practices were standards to which local miners were not accustomed. Local miners had not experienced this level of care from any of the previous foreign or domestic mining companies with which they had been employed (Walton, Interview, 2012).

Beyond this, Endeavour and Great Panther CSR initiatives change direction. Corporate philanthropy is widely expected in Mexico. It is a part of the business culture, and Endeavour has risen to the challenge. It makes little distinction between CSR efforts and other operational decisions. CSR is not about voluntarism or simply doing the right thing. "CSR is about improving the quality of every employee in each community in which we work" (Endeavour, 2012).

In the workplace, it means rigorous safety policies, training and practice to ensure our employees work in a safe and healthy manner. Safe work habits are just not a goal, they are our culture. In the environment, it means taking extra measures to not only maintain the integrity of the ecosystems, but to improve previously disturbed areas, even if they predate and are unrelated to our activities. Green environmental practices are a reflection of who we are. In the community, it means supporting the local people whenever possible, from helping to fund festival celebrations to more important ventures such as skills training for young people who are unemployed, or sponsoring university scholarships (Endeavour, 2012).

Highlights from 2010-2011 include significant reductions in lost time from accidents, enhanced mine safety and rescue training, and a monthly wage bonus for safe work habits. This led to national recognition in 2010 by "Cascos de Plata" for safe practices Guanacevi & Guanajuato and a Clean Industry Award. Endeavour has also been recognized for its contribution to local education although most of these contributions orient around scholarships for the children of its employees (Endeavour, 2012).

Great Panther's local contributions to the community extend beyond Endeavour's philanthropic approach by adding capacity-building to its agenda. Its vision for CSR is to excel in the "quality of work within the company, corporate governance and ethical practices, its relations with hosting communities and environmental preservation" (Great Panther, Corporate Relations, 2011, p.5). In addition to health and safety and environmental concerns, it has also focused on value-added training at the local level, preserving a UNESCO world heritage site which exhibits the history of silver mining from the colonial period to present day, as well as contributing funds and equipment to both the faculty of mines and history at the University of Guanajuato. In 2011, it received national recognition for its CSR initiatives from CEMEFL, Centro Mexicano para la Filantropia (Mexican Centre for Philanthropy). "This ratifies our commitment to achieve the highest standards in Corporate Social Responsibility for our operations in Mexico," said Robert Archer, President & CEO (Great Panther, News Release April 2011). "Since its inception, Great Panther has endeavoured to be a good corporate citizen by implementing industry best practices and we have worked diligently to become a responsible leader in our hosting communities." "We recognize that there are always opportunities for improvement and by promoting an open dialogue with Great Panther's stakeholders, we will continue to strive to minimize environmental impacts while maximizing social and economic benefits," said Eduardo Ortiz Briones, Vice President of Corporate Relations in Mexico (Great Panther, News Release April 2011).

Given that the environmental laws are similar between Mexico and Canada, both companies were asked about the issue of enforcement. Like Canada, Mexico has an abundance of mineral wealth; particularly in silver, and mining it has been of vital economic importance since the colonial period. Most mining case studies create the illusion that a foreign mining company operating in a jurisdiction such as Mexico is a dominant capitalist machine which bullies governments of emerging economies to get done what it wants

done (Ismi 2009, Keenan 2010). Sometimes this is true. All too often, when the commercial value of the resource is depleted, mining operations relocate to the next project leaving behind an environmental footprint of deforestation, tailings and waste, polluted water, and an unemployed and dependent community. In Mexico, it is currently less so. Domestic mining operators represent 92% of all current production (Suppen, 2006). Throughout the last two decades, the Mexican government has committed itself to a cultural shift toward a regime of sustainable development evidenced by passing progressively more specific and tougher legislation including the National Environment Auditing Program and ISO 14001 standards (Suppen, 2006). When asked about the effectiveness of these standards, Endeavour and Great Panther agreed environmental enforcement, not weak governance practices, was an issue in some emerging economies. “Mexican authorities could be more forceful with these regulations. Companies that take advantage of the lack of stringent enforcement should be held accountable,” said Walton (Interview, 2012) “At key points, we always approach the regulators, show them our plans, and invite their input before proceeding” (Walton, Interview, 2012).

The researcher asked Endeavour and Great Panther about the relationship between the corporate executive team and CSR. In this industry, mining companies at the mid-tier level and lower tend to be operated either by a combination of retired brokers and investor relations people, or lawyers, or geologists and mining engineers. Pedigree is important. Where companies are operated by other than experienced miners, everything suffers. In the case of Endeavour, its CEO, COO, and VPs for operations and exploration each have graduate degrees in geology and average between 22 and 35 years of field experience with some of the larger mining companies operating in North and South America. Great Panther’s executive team averages between 30 and 36 years of field experience each with premier companies such as Agnico-Eagle, Goldcorp, and Newmont. Given that Great Panther’s CEO also worked in an executive position for Placer Dome and Noranda, it is plausible that his sense of CSR was heavily influenced by that culture and that Great Panther’s policies were worked out at the ground level just like those at Placer Dome. In the case of Endeavour, it was clearly evident that the company intended to leave the community in better shape than it found it (Endeavour, 2012).

The final interview topic centered on the scale of CSR efforts and how they were received in the community. Both Endeavour and Great Panther acknowledged two issues. Firstly, their access to the mineral rights was determined by the community cooperative. Both companies had to prove their intentions to the community before any agreements were struck regarding exploration and development (Walton, 2011; Bertsch, 2012). This is consistent with anthropological literature written about the Guanajuato community. In Ferry’s studies on silver and patrimony, considerable reference is made to the historical importance of silver in this community and its legacy which includes the right to mine, jobs and standards of living derived from mining employment as well as historical and cultural identification. Ferry writes “patrimony acts as a language of power and authority read through the practices of production, circulation, and consumption (Ferry, 2002, p.333). Guanajuato represented more than a physical community of interest. It was ideological, political, and cultural as well. For Endeavour and Great Panther, effective CSR was built from the bottom up and directed by the degree of community engagement. On-site employees were all from Guanajuato and its environs, Great Panther’s mine manager was actually a graduate from the University of Guanajuato, and ideas for local CSR initiatives came from the employees themselves. From supporting local medical clinics, schools, and sports teams to maintaining chapels near the mine and university scholarships for the children of mine workers, these were initiated by local interests. This runs counter-intuitively to the business case that suggests CSR efforts aligned with the company’s interests are more likely to generate value. It appears equally plausible that CSR efforts aligned with the community’s interests are capable of generating value as well.

CONCLUSION

This study recognizes that stakeholder entitlement has become foundational to the development and implementation of CSR policies and initiatives. As an aide to understanding the role of CSR in the business policies of Endeavour Silver and Great Panther Silver, this study offered the following proposals: was it plausible to infer that social contract rather than stakeholder entitlement might provide a better explanation of corporate-community engagement; and if that were the case, would it follow that by using the social contract framework, it could be suggested that Canadian mining companies are prepared to promote better CSR standards irrespective of NGO and governmental scrutiny. This study suggests the answer to both questions could be affirmative. The business case for CSR seems important, but there are suggestions that it was not the driver behind either company's decision to frame and implement CSR they way it did. These decisions appear to be linked to the company's sense of its community of interest. The stakeholder argument falls short as a driver for these policies because the theory presupposes that in recognizing shareholder interests, it can successfully engage them through CSR initiatives. Evident from the point those companies set their eyes on Guanajuato was the fact that these communities had made an assessment of their needs. No mining operator had been able to explore the mining potential of this area in decades because the local community would not let that happen. Neither Endeavour and Great Panther made comprehensive lists of potential stakeholders and targeted CSR policies toward them. These companies eventually received their permits because they made promises to the community they knew they would keep. It was not the business case for CSR that sealed the deal. In the case of Endeavour, its CSR policies were put in place over several years as needs became apparent. Key was the understanding to engage the community and act in a way it expected. For Endeavour Silver, this led to an engagement process based on a sense that its local stakeholders were those whose interests were aligned with the mine's success. For Great Panther, community engagement was seen on a wider historical level. It related its stakeholders to those who valued the mining tradition in the community and those whose identity was forged by the evolution of the community industry.

HIGH FREQUENCY TRADING AND SERVER LOCATIONS

Yi Sun, California State University San Marcos

ABSTRACT

In this study, we propose an assessment model and a linear programming model to help investment firms to choose optimal server locations based multiple criteria and constraints including performance, reliability, cost and policy impact.

Due to the move to high-speed Internet communication and tremendous increases in computing power, network latency, which is mostly determined by physical distance, has begun to play a more important role in determining service response time. Hence, the physical location of an application server will impact the performance of the services it hosts. As a result, in recent years, firms have rented servers near stock and commodity exchange centers so they can get access to trading statistics on their computers faster than competing investors. This practice is called colocation and widely used to enable firms to execute high frequency trading, which constitute over 60% of all trading volume. The physical proximity to the exchange center reduces the time from when a firm's buy or sell order is entered and when it's executed by a few milliseconds. With reduced network latency, their proprietary algorithms installed on these servers will be able to interpret the data and execute transactions with a speed advantage against competitors.

If a firm is locate its application server near one exchange center, then it is mostly likely far away from other centers, especially when those centers are geographically distant from each other. This creates a problem if the firm is trading simultaneously with multiple exchange centers to take advantage of arbitrage opportunities. Therefore, depending on trading practice and patterns, the server location may not necessarily be located near one center. Instead, the server should be geographically deployed in a location between those centers it trades in. Still, apart from physical distance (network latency), there are many other criteria a firm needs to consider in selecting an optimal server location to host its trading applications. The criteria may include, among others, trading partners, trading patterns, network bandwidth, server facility cost, server cost and speed, system reliability, local taxation, power usage and environmental impact.

In this study, we will propose a model based on Saaty's Analytic Hierarchy Process and Brown-Gibson method for evaluating all the criteria for selecting a server location. We will then create a linear programing model with the evaluations as parameter values and formulate a heuristic algorithm to solve the problem. To be able to accurately reflect trading firms' priority in the criteria and test our model with real-world data, we will conduct an empirical research with trading firms. We will conduct surveys and focus groups to identify and evaluate relevant criteria of the model, and collecting firms' assessment data. Survey questionnaires will focus on (1) trading pattern of the firm, such as trading in multiple exchange centers; (2) trading focus, such as currency, commodity or stock; (3) factors that influence the usage of the servers for high frequency trading algorithms; (4) services performance impact on their business operation and profit margin; (5) budget concerns and cost constraints; (6) policy interference in their ability to freely select server locations. For surveys, we plan to use both telephone and in-person interviews. We will also conduct multiple focus groups in different cities for further in-depth inquiries and analysis.

Once we have completed the empirical study, we will use the data to feed models we created so we can provide real-world solutions. We will use Analytic Hierarchy Process approach for assessing the

multiple criteria of server locations. The AHP approach, however, involves time-consuming pair-wise comparisons and may not be practical for all firm managers to implement the evaluation. To alleviate the problem, we adapted the Brown-Gibson method to further divide the criteria into two categories: subjective and objective. While the subject criteria reflect a user's personal opinions or attitudes, the objective criteria are those can be measured quantitatively. We then incorporate the composite indices as a result of the previous model into a mathematical linear programming model, which will require a heuristic algorithm to be developed to obtain optimal solutions.

SUSTAINING PEACE AND DEVELOPMENT: THE PHILIPPINES' COUNTERINSURGENCY PROGRAM

Wilfred S. Manuela Jr., Ateneo de Manila University, Quezon City, Philippines
Adonis R. Bajao, Armed Forces of the Philippines, Quezon City, Philippines

ABSTRACT

This paper examines the internal and external factors that affect the Philippine government's fight against insurgency. The time series data consist of socioeconomic and military variables for the period 1986–2008. The statistical model consists of two equations estimated separately using ordinary least squares—the first equation estimates the impact of external factors, which are beyond the control of the Armed Forces of the Philippines, that affect insurgency; the second equation estimates the impact of internal factors, which are within the control of the military to some extent, on the military's effectiveness and efficiency in sustaining peace and development, especially in the countryside where insurgency and economic stagnation are the norm. The results indicate that socioeconomic factors such as self-rated poverty and per capita real personal consumption impact the number of insurgents positively and negatively, respectively, indicating that socioeconomic development may reduce the frequency and gravity of insurgency. The results also indicate that internal factors such as the budget of the Armed Forces of the Philippines, the number of Philippine Army armored vehicles used in the fight against insurgency, and the number of Philippine Navy ships that patrol the areas where insurgents operate, tend to reduce the number of insurgents, indicating that the military's strategies on counterinsurgency are working, albeit inefficiently given the resources and personnel involved; this may not be sustainable in the long run. Overall, the results of the least squares estimation indicate that the counterinsurgency efforts of the government should involve both socioeconomic development and military intervention in the affected areas.

KEYWORDS: Counterinsurgency; armed forces; peace and development

INTRODUCTION

Counterinsurgency involves actions taken by a nation's recognized government to contain or quell an insurgency. Counterinsurgency operations are common during occupation and armed rebellion. The term took on different meanings during the counterinsurgency operations conducted by the Spanish, American, and Japanese occupation forces against Filipino revolutionary and guerrilla forces in the 19th and early 20th centuries. After World War II, the term was used to refer to counterinsurgency operations conducted by the established Philippine state against armed rebellion operating in the country. Counterinsurgency may be armed suppression of a rebellion, coupled with tactics such as 'divide and rule' designed to break the link between the rebels and the population in areas where the insurgents move and operate, and because it may be difficult or impossible to distinguish between an insurgent, a noncombatant supporter of an insurgency, and completely uninvolved members of the local population, counterinsurgency operations have often rested on a confused, relativistic, or otherwise situational distinction between insurgents and innocent civilians (Quilop et al., 2007).

This paper examines the socioeconomic and military variables that affect the insurgency problem in the Philippines. While military response to armed conflict is necessary to enforce peace and order, providing a more secure environment for socioeconomic activities to thrive, military intervention may not be sufficient to solve the insurgency problem; socioeconomic mobility and development may be equally

important. Fielding and Shortland (2010) argue that political repression and counterinsurgency operations by the Egyptian military may exacerbate political violence while socioeconomic intervention, such as food subsidies, may alleviate the situation. Berman et al. (2011a) observe that providing socioeconomic services in conflict areas tend to reduce insurgent attacks.

The paper is organized as follows. The next section reviews the relevant literature on counterinsurgency while the third section describes the conceptual framework and the linear model used in estimating the impact of socioeconomic and military variables on insurgency strength. The fourth section discusses the data and methodology, followed by the empirical results and analysis. The last section concludes the paper and presents some policy implications of the findings.

LITERATURE REVIEW

The evolution of the Philippines' counterinsurgency program involves five theories spanning four decades. Each theory builds on the strengths of earlier theories with certain improvements added, resulting in an incremental approach to dealing with the insurgency problem.

The Triad Model, advocated by Crisol (1972), has three factors—counter-guerrilla combat operations, intelligence operations, and psychological warfare. The Circle Model, advanced by Aguirre (1986), is an improvement of the triad model by emphasizing development programs and public safety. The Macro Four-Triad Model by Yap (2007) is an improved version of the triad model—one triangle represents the triad model, the military portion of the model, while the remaining three triangles represent the participation of civilian government agencies and nongovernmental organizations; the political, psychological, and ideological separation of the insurgency movement from the 'minds and hearts' of the people; and the physical isolation and destruction of the insurgents. The Star Model by Sosmeña (2008) is derived from the United States War College's 'star' model that involves local government units and other civilian agencies in the counterinsurgency campaign, combining all known methods in civilian-and-military operations. The AFP Internal Peace and Security Plan (2011), also known as the Concentric Circle Model, is a comprehensive approach that involves all societal stakeholders in finding a solution to the insurgency problem.

CONCEPTUAL AND EMPIRICAL FRAMEWORK

The evolution of counterinsurgency theories in the last four decades indicates that the Philippine government's success in containing or suppressing the insurgency problem in the country cannot be achieved solely through military means. Counterinsurgency operations may even "act as a recruitment tool for the insurgency" (Hanson and Schmidt, 2011). Insurgency or internal conflict, in general, is also influenced by geographic and socioeconomic factors because of the relative ease of recruiting would-be insurgents in isolated areas and impoverished communities (Do and Iyer, 2010). Although unemployment may result in poverty, people who are unemployed may not necessarily rebel against the government; no significant relationship exists between unemployment and insurgency (Berman et al., 2011b). Countries with a lower per capita gross domestic product (GDP), however, are more likely to have a civil war (Holtermann, 2012), indicating that insurgents fight established governments, which they consider either as corrupt, keeping socioeconomic advancement only to a select group, or inept, unable to effectively and efficiently manage their resources—human, land, capital, and technology—in their march toward socioeconomic development.

In the Philippines insurgency strength, or the number of insurgents involved in armed rebellion against the government and the populace, is influenced by ideological issues, military and government variables, political and legal concerns, and socioeconomic factors. Due to the dearth of data and information on

most of the aforementioned factors, only a number of socioeconomic variables and military factors are included in the empirical model.

The econometric model consists of two equations. The external factors equation associates insurgency strength, the dependent variable, with four explanatory variables—self-rated poverty, economic sentiment index, per capita real GDP and personal expenditures. The internal factors equation associates insurgency strength, the dependent variable, with five explanatory variables—AFP budget, AFP staff, Philippine Army (PA) armored vehicles, PA trucks, and Philippine Navy (PN) ships. Although the two equations share the same dependent variable—insurgency strength—the econometric model cannot be collapsed into one equation that includes both external and internal factors due to the multicollinearity between external and internal variables (Anderson et al., 2005; Cameron and Trivedi, 2009). The econometric model is thus specified as:

External Factors Equation

$$\text{Insurgency strength } (t) = \beta_0 + \beta_1 \text{ Self-rated poverty } (t) + \beta_2 \text{ Economic sentiment index } (t) + \beta_3 \text{ Real GDP } (t) + \beta_4 \text{ Real personal consumption } (t) + \varepsilon(t)$$

Where for each year t ,

Insurgency strength	=	total number of insurgents regardless of affiliation
Self-rated poverty	=	self-rated poverty incidence in percent
Economic sentiment index	=	percent of the population indicating a positive outlook
Real GDP	=	per capita real GDP in thousand pesos
Real personal consumption	=	per capita real personal expenditures in thousand pesos
ε	=	error term

Internal Factors Equation

$$\text{Insurgency strength } (t) = \beta_0 + \beta_1 \text{ AFP budget } (t) + \beta_2 \text{ AFP staff } (t) + \beta_3 \text{ PA armored vehicles } (t) + \beta_4 \text{ PA trucks } (t) + \beta_5 \text{ PN ships } (t) + \varepsilon(t)$$

Where for each year t ,

AFP budget	=	AFP budget in million pesos
AFP staff	=	number of military and civilian employees
PA armored vehicles	=	number of armored vehicles used by the army
PA trucks	=	number of non-armored vehicles used by the army
PN ships	=	number of ships used by the navy
ε	=	error term

The other variables are as defined in the external factors equation.

In the external factors equation, self-rated poverty should impact insurgency strength positively while higher per capita GDP and personal consumption and more people having a positive outlook on the economy should impact insurgency strength negatively. In the internal factors equation, all explanatory variables should impact insurgency strength negatively since the military uses its economic resources, personnel, equipment and technology, in eradicating, or at least containing, the insurgency problem in the country.

DATA AND METHODOLOGY

The data for the military-related variables come from the AFP while the data on socioeconomic variables come from various editions of the National Statistical Coordination Board's Philippine Statistical Yearbook; social weather indicators, such as self-rated poverty, come from the Social Weather Stations.

The data used in the ordinary least squares (OLS) estimation consist of annual time series from 1986–2008, although missing data for a number of variables in some years reduced the included observations in the OLS estimation to 15 years for the external factors equation and 10 years for the internal factors equation (refer to Tables 1 and 2).

The Durbin-Watson statistic for each equation (refer to Tables 1 and 2) indicates the absence of autocorrelation in the data, signifying that the OLS estimators are efficient and best linear unbiased estimators (Anderson et al., 2005; Gujarati, 1999) of the population parameters.

RESULTS AND ANALYSIS

The OLS estimation results for the external factors equation, consisting of socioeconomic variables that are outside the control of the military, are shown in Table 1. The adjusted R-squared is 0.83, indicating that the variability in self-rated poverty, economic sentiment index, per capita real GDP and personal consumption, accounts for the variability in the number of insurgents 83% of the time. Three of the four explanatory variables are significant.

Table 1: Estimation results of the external factors equation

Variables	Coefficient	Standard Error	t-Statistic
Constant	-18261.74	41654.22	-0.44
Self-rated poverty	644.28	302.50	2.13 *
Economic sentiment index	184.19	108.91	1.69
Real GDP	16.06	6.64	2.42 **
Real personal consumption	-21.67	8.13	-2.67 **
Adjusted R-squared	0.83		
Durbin-Watson statistic	2.17		
Included observations	15 after adjustments		

Two asterisks (**) indicate that a variable is significant at the 5% level while a single asterisk (*) indicates that a variable is significant at the 10% level. The constant and the economic sentiment index variable are not significant.

A percent increase in self-rated poverty increases the number of insurgents by 644, holding all other variables constant, indicating that poverty may drive individuals to rebel against the established government because of the perceived socioeconomic injustice in the country (Holtermann, 2012). These individuals consider armed rebellion as a means to prod the government to take action in correcting social injustice such as widespread poverty.

Although significant in explaining insurgency strength, per capita GDP has the reverse sign, suggesting that individuals who do not perceive to be advancing economically with the rest of the country tend to join the armed rebellion against the government; for every thousand pesos increase in the per capita GDP of the Philippines, 16 more individuals, who perceive themselves as socioeconomically impoverished relative to the average person in their communities, join the insurgency movement against the government, holding all other variables constant. This finding reinforces the impact of perceived socioeconomic marginalization on the individual's proclivity in rebelling against the government and its instrumentalities in search of a better life.

Per capita personal consumption is perhaps a better proxy to an individual's economic wellbeing than per capita GDP and its impact on insurgency strength is negative, as expected. A thousand pesos increase in per capita personal consumption reduces the number of insurgents by almost 22. This indicates that individuals who do not perceive themselves as socioeconomically impoverished due to rising personal consumption will be more difficult to recruit to join the insurgency. This finding also suggests that insurgents who perceive that a return to civilian life may be more socioeconomically rewarding than fighting against the government will decamp to become productive elements in their local communities.

The OLS estimation results for the internal factors equation, consisting of military-related variables that are within the control of the AFP, are shown in Table 2. The adjusted R-squared is 0.94, indicating that the variability in the AFP budget, AFP staff, PA armored vehicles, PA trucks, and PN ships, accounts for the variability in the number of insurgents 94% of the time. All five explanatory variables are significant.

Table 2: Estimation results of the internal factors equation

Variables	Coefficient	Standard Error	t-Statistic	
Constant	441518.10	117408.10	3.76	**
AFP budget	-1.83	0.47	-3.93	**
AFP staff	-0.28	0.10	-2.79	**
PA armored vehicles	-735.85	261.88	-2.81	**
PA trucks	17.88	6.25	2.86	**
PN ships	-225.22	63.37	-3.55	**
Adjusted R-squared	0.94			
Durbin-Watson statistic	2.18			
Included observations	10 after adjustments			

Two asterisks (**) indicate significance at the 5% level.

Holding all other variables constant, a million pesos increase in the AFP budget tends to decrease the number of insurgents by almost two while increasing the number of AFP staff by four reduces the number of insurgents by one, indicating that the Philippine government spends an enormous amount of resources in its fight against insurgents. This suggests that the military is rather inefficient in maintaining peace and order, which underpins socioeconomic development in the country, especially in conflict areas.

A unit increase in the number of army armored vehicles used in counterinsurgency operations tends to reduce the number of insurgents by almost 736, holding all other variables constant, indicating that this type of military technology is extremely effective and efficient in reducing the number of rebels, either through death or attrition (i.e., armored vehicles may act as a deterrent against attacks on the military). The non-armored trucks used by the military in transporting personnel, equipment, and provisions, however, tend to attract insurgents into the conflict areas, increasing the number of insurgents by almost 18 for every unit of army truck used, holding all other variables constant. This suggests that individuals who may be considering joining the armed rebellion against the government are tempted to attack an easy target such as non-armored military trucks that carry economically valuable equipment and provisions, effectively joining the insurgency as they attack a military truck. This occurrence is not uncommon in the southern Philippines as rebel groups routinely ambush military convoy, seizing valuable equipment and supplies. This may indicate that the military should improve the armed escorts of military trucks that are delivering equipment and provisions to government troops.
